In Scotland, Presbyterian though the ecclesiastical system of that country be, the old Roman C. L. still prevails to a certain extent. 'So deep hath this canon law been rooted,' observes Lord Stair in his *Institutes of the Scotch Law*, 'that even where the pope's authority is rejected, yet consideration must be had to these laws, not only as those by which church benefices have been erected and ordered, but as likewise containing many equitable and profitable laws, which, because of their weighty matter, and their being once received, may more fitly be retained than rejected.' In two old Scotch acts of parliament, made in 1540 and 1551, the C. L. is used in conjunction with the Roman law to denote the common law of the country, the expression used being 'the commoun law, baith canon, civil, and statutes of the realme.' See on the subject of this article generally the following authorities—Blackstone's *Commentaries*, by Kerr, vol. i. pp. 65 and 66; Stephen's *Commentaries*, 4th edition, vol. i. pp. 61 and 69—vol. ii. pp. 251, 256, 257, and 290—vol. iii. pp. 45, 48, and 421—and vol. iv. p. 242; Dr Irving's *Study of the Civil Law*; and Phillimore on the *Influence of the Ecclesiastical Law*, &c., 1851. See also a discriminating article on this subject in Knight's *Political Dictionary*, 1845; and see Wharton's *Law Dictionary*, 2d edition, 1859. It will also be found carefully treated in Dr Hook's *Church Dictionary*, 7th edition, 1854. In regard to Scotland, see Stair's *Institutes of the Law of Scotland*, I. 1, 13, and II. 8, 29; and Erskine's *Institutes* of the same law, I. 1, 28.

CANONICAL HOURS are the times fixed for divine service in the Catholic Church, but no longer strictly adhered to. These have not always been the same, and it is not known when nor by whom they were settled—some say by Popes Damasus, or Gelasius, or Gregory—but they are now fixed at seven; viz., Matins and Lauds, Prime, Tierce, Sext, Nones, Vespers, and Compline. These used to be observed as follows: Prime, Tierce, Sext, and Nones, at the first, third, sixth, and ninth hours of the day, counting from six in the morning; Vespers at the eleventh hour; Compline, or Completorium, as completing the services of the day, at midnight; and Matins shortly after midnight. These hours were by the Anglo-Saxons called Uhtsaang, Primesang, Undersang, Middaysang, Noon-sang, Evensang, and Nightsang. The first two and the last formed the nocturnal, the remaining four the diurnal offices. The reasons given for the

dividing the day into seven parts were—that in seven days the creation was completed, that seven times a day the just man falls, there are seven graces of the Holy Spirit, seven divisions of the Lord's Prayer, seven ages of a man's life, &c. The hours had also each its mystical reference to certain sacred occurrences, such as the incidents at our Lord's birth and crucifixion. The word 'hour,' in C. H., is derived, as some have suggested, from *ora*, a prayer; but more probably from *hora*, an hour, and called canonical because according to the canon or rule of the church. The proper offices for the C. H. are to be found in the *BARVILARY* (q. v.).

CANONICALS, a term used to describe the proper ecclesiastical dress of the clergy. See VESTMENTS.

CANONISATION, in the Church of Rome, the act of the pope by which a deceased person is solemnly declared to be a saint. It had its origin in the practice of the early church, of inserting in the commemorative prayer of the Eucharistic Liturgy the roll of the names of those who had died as martyrs, or distinguished themselves as confessors of the faith. This record was entered in the diptychs of the church, and read in the so-called 'Canon' of the Liturgy. Each bishop was at first accustomed to declare deceased persons to be saints. In the West, the exercise of this power came to be reserved to the popes, and the ceremonial itself was invested with much solemnity, and regarded as of very great importance. The first papal C. was accomplished by John XV. The popes have possessed the exclusive right since 1170. The right of *Beatification* (q. v.) also belongs to them. When it is proposed to canonise a person of reputed sanctity, the pope declares his views in a consistory, and an inquiry is instituted as to the virtues and merits of the person proposed. The form of inquiry is that of a regular process at law, and an ecclesiastic is specially appointed to contend against the claims advanced, who receives the designation of *Advocatus Diaboli*; and on failure of satisfactory proof, the process is abandoned. When a favourable decision is pronounced, the ceremony of C. is performed in St Peter's Church with great pomp. The last C. was in 1862.

The Greek Church also recognises *Canonisation*. The right to perform the ceremony lies with the Patriarch of Constantinople, but it has rarely occurred. An analogy to Christian canonisation has been found in the *Apotheosis* (q. v.) of the ancient Romans.

CANONRY, the office and dignity of a CANON. See CATHEDRAL.

CANONS, Book or, in Scottish ecclesiastical history, a code of canons or rules for the Church of Scotland, prepared by the Scottish bishops, in obedience to the command of Charles I., revised by Laud, and confirmed by letters-patent under the great seal, 23d May 1635. It tended much to increase the dissatisfaction prevalent throughout Scotland, and which soon broke out so violently. It not only required the most strict adherence to the Liturgy, then not yet published, but enjoined many things concerning ceremonies in worship beyond what Laud had been able to introduce in the Church of England; it also took away the powers of church-courts, and decreed the penalty of excommunication against all who should deny the government of the church by bishops to be scriptural, whilst its very first canon decreed that penalty against all who should deny the king's supremacy in ecclesiastical affairs.

CANONS OF THE CHURCH OF ENGLAND, called Constitutions and Canons

## CANOPIC VASES—CANOSA.

Ecclesiastical, agreed upon, with the king's licence, in the synod held at London in 1603—1604. They were drawn up by the Convocation, in order to give effect to the decisions of the Conference held at Hampton; and are, for the most part, a digest of old canons, with some new ones added. They are 141 in number. They are the basis of the ecclesiastical law, as far as the clergy are concerned, but they are not binding upon the laity, except in so far as they are declaratory of the ancient canon law. There had been a previous body of canons drawn up in 1571, but these had not been sanctioned by the sovereign. In 1640, the Convocation, which was then assembled with the parliament, prolonged its session beyond it, and passed a body of canons of a very arbitrary character; amongst other things, enjoining that on some Sunday in every quarter, every officiating minister should insist on the divine right of kings and their prerogatives, and enforce conformity to the rites of the Church of England. In these canons, it was directed that the communion-table should be railed in, and be placed as in cathedrals, as is now done in all churches. These canons were abrogated by an act passed in the 13th year of Charles II. An account of these canons and those now in force may be found at length in Hook's *Church Directory*. —Every clergyman, when instituted to a benefice or licensed to a cure, promises CANONICAL OBEDIENCE to the bishop—i.e., the obedience due according to the canons of the church.

CANOPIC VASES were vases used by the Egyptian priests to contain the viscera of embalmed bodies. They were arranged in a series of four—the first contained the stomach and larger intestines; the second, the smaller intestines; the third, the lungs and heart; and the fourth, the liver and gall-bladder; and each had on its lid the head of the particular deity who was supposed to preside over the contents.

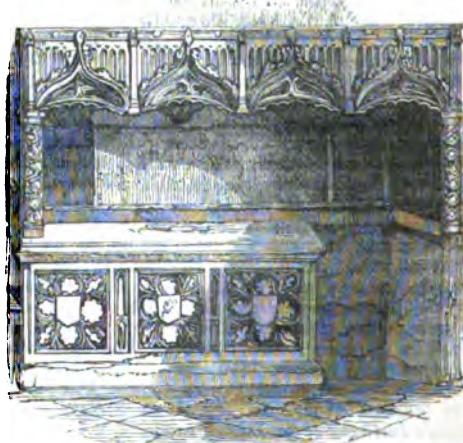

CANO'PUS, or CANO'BUS, a city of ancient Egypt, from which the Canopic mouth of the Nile derived its name, was situated on the sea-coast, 15 miles east of Alexandria. The Canopic mouth of the Nile appears to have been at an early period the only one into which foreign ships could enter. At C. the boundary-line between Asia and Africa was drawn by the ancient geographers. There was a temple of Hercules here, which was a secure sanctuary to all who fled to it; also one of Serapis, as several extant Greek inscriptions shew. The inhabitants of C., a mixed Egypto-Hellenic people, were infamous, in the Greek and Roman times, for their profligacy. The city declined after the rise of Alexandria. Traces of its ruins are visible about 3 miles from Aboukir.

CANOPUS is also the name of a very brilliant star of the southern hemisphere, in the constellation of the ship Argo, and, as Plutarch relates, received its name from Canopus, the pilot of Menelaus.

CANO'PY (Lat. *Canopeum*; Gr. *Kōnōpeion*, from *Kōnōpe*, gnat or mosquito). The derivation of this word throws a curious light on its original meaning, which probably was a mosquito-curtain. The simplest form of C., in its primitive sense, is that mentioned by Herodotus (ii. 95), who tells us that the fishermen on the Nile were in the habit of suspending the net with which they had fished during the day on an upright pole, from which it was expanded into the form of a tent, and served to protect them from the attacks of insects during the night. As it has been proved that insects will not pass through the meshes of a net, though wide enough to admit them, it is probable that this simple contrivance may have been quite effectual for the purpose

for which it was used. Horace (Epod. ix. 9), and others of the ancient writers, mention gnat-curtains (canopea). Subsequently, the same term came to be used for the projecting covering and hangings of a bed, without reference to their original use, and latterly for any projecting covering of a similar form, to whatever use it might be adapted, or of whatever materials it might be formed. C. is thus used to signify the covering which is borne over the heads of kings and other persons of distinction, and still more frequently over the Holy Sacrament and the image of Christ, in processions in Roman Catholic countries. See BALDACHIN.

In Gothic architecture, C. is the term applied to those rich coverings which are frequently met with over niches and tombs, and sometimes over doors and windows. It belongs chiefly to the decorated and perpendicular styles, though it was not unknown much earlier. The C. consists of a roof, which may be supported on pillars all round, or may have one, or if in an angle two, sides attached to the wall, with dependent ornamental work representing drapery. The early English canopies are usually simple in form; those in French buildings of the same period being greatly more complicated and elaborate, as, for example, those in the cathedrals of Chartres and Bayeux. In the decorated style, the canopies were richly ornamented and very various in form, as in the accompanying illustration. Some canopies are ornamented

Canopy over Chaucer's Tomb in Westminster Abbey.

by pinnacles supporting smaller canopies, the whole terminating in a structure resembling a small turret, or crocketed spire. In the perpendicular style, though more varied in form, the canopies resemble those in the decorated. Most of the cathedrals and larger churches of England furnish examples of canopies, many of which are enumerated in Parker's *Glossary of Architecture*. For the use of canopies in Italian architecture, see BALDACHIN.

CANO'SA, a town of Southern Italy, in the province of Bari, 13 miles south-west of Barletta. It is situated on the declivity of a steep hill, upon the summit of which there are the remains of an old castle. It has a cathedral; and in an adjoining court is a tomb to Bohemond, Prince of Antioch. It is chiefly remarkable, however, in connection with the discovered antiquities of ancient *Canusium* (one of the chief cities of the Apulians, the origin of which

is obscured in the mists of mythology), on the site of whose citadel the modern town is said to stand. The antiquities consist of subterranean sepulchres, containing painted vases and funeral furniture of the most magnificent description in perfect order, painted busts, marble statues, &c. Many of the bodies found here were attired in cloth of gold, with head-dresses gleaming with precious stones, and earrings and bracelets of rich and exquisite workmanship. The objects were transferred to the museum at Naples. The ruins of an amphitheatre, aqueduct, &c., have also been found. C. suffered by earthquake in 1851. Pop. 8000.

CANOSSA, a town of Northern Italy, in the province of Reggio, about 12 m. S.W. of the city of Reggio, celebrated as the place where, in 1077, the Emperor Henri IV. of Germany obtained absolution from Pope Gregory VII., after three days' humiliation. The place, formerly of some importance, is now deserted.

CANOVA, ANTONIO, the founder of a new school of Italian sculpture, was born, November 1, 1757, at Possagno, a village in the Venetian territory. Having displayed in boyhood great talent in modelling, the artist gained the patronage of Giovanni Faliero, a Venetian senator, by whom he was sent to work under a sculptor at Bassano. His first imaginative performance, 'Eurydice,' half the size of life, was executed in his 17th year. After this he went to Venice, where his study of art properly began. In 1779, Faliero sent him to Rome, with an introduction to Cav. Zuliano, the Venetian ambassador, and one of the most illustrious patrons of art at this time in Italy. In Rome the first result of his studies appeared in the statue of 'Apollo,' which must be regarded as his earliest effort in ideal sculpture; but a far greater progress toward the pure style of the antique was evident in his next work, 'Theseus with the Centaur.' Nevertheless, C. did not rigorously adhere to the severe simplicity of the antique, but rather took pains to mitigate it by a peculiar grace and loveliness of his own, such as characterised his group of 'Cupid and Psyche,' which was produced soon after he had completed the monument of Pope Clement XIV. This is apparent even in the colossal monument of Clement XIII. (erected in St Peter's, 1792); though this work, on the whole, is a magnificent effort of genius, simple in style, and with nothing overwrought in the figures. Among his other works may be noticed a 'Winged Cupid,' 'Venus and Adonis,' a 'Psyche holding a Butterfly,' 'Penitent Magdalen,' in life-size; 'Hercules hurling Lichas from the rock,' a colossal work, but not free from affectation; 'Kreugas and Damoxence' (two pugilists), 'Palmades,' and 'Perseus with the head of the Medusa,' a work which, more than all previous efforts, served to raise his fame. In 1802, C. was appointed by Pope Pius VII. chief curator of all Roman works of art in the Papal States; but was soon called away to Paris, to prepare the model of a colossal statue of Bonaparte.

After the fall of the French empire, C., in 1815, was employed by the Roman government as ambassador to recover the works of art which had been taken to Paris, and paid a visit to England. On his return to Rome, he was created Marquis of Ischia, with a pension of 3000 scudi. This money he expended in the support of art and artists in Rome. C. died in Venice, 13th October 1822. A marble statue was erected to his memory in the Church de' Frati, 1827. Another monument to C. was erected in the library of the capitol, by order of Leo XII., in 1833.

It is universally allowed that to C. belongs the

honour of having restored to sculpture the position which it had lost among the modern fine arts. After Michael Angelo Buonarotti and Bernini, he was the third of epoch-making Italian sculptors. His delicate execution and masterly treatment of marble are unrivalled, and even his faults—viz., his exaggerated nobility and carefulness, and his use of corrosives to produce fine finish—served to attract by the novel effects which they produced. The essential characteristic of all his works is sentiment—often verging, however, on sentimentalism—and this also, like his delicacy in details, was accordant with the taste prevalent in his time, and was the chief cause of his popularity, as of his errors. When judged by the sterner principles of antique sculpture, the works of C. are found deficient in that objective or realistic character which Thorwaldsen could express so well.

During his leisure hours C. amused himself in painting, in which he attained such a degree of excellence in following the colouring of the Venetian masters, that his pictures have even deceived connoisseurs. In his private life, C. was a very amiable and benevolent man. Biographies of C. have been written by Missirini (4 vols. Frato, 1824), Cicognara (Venice, 1823), and Rosini (Pisa, 1825).

CANROBERT, FRANÇOIS CERTAIN, DE, Marshal of France, born in 1809, studied in the military school of St Cyr, and in 1823 entered the army. In 1834 he sailed for Algeria, and during the war in the province of Oran was made a captain. In the storming of Constantine, he was one of the first who entered the breach, when he received a wound in the leg. About the same time he had the decoration of the Legion of Honour conferred upon him. In 1846 he became lieutenant-colonel, and soon after colonel. In 1848 he had the command of an expedition against the tribes of the Bouaoun, whom he defeated at the Pass of Djerma, and was victorious against the Kabyles. As general of brigade, in 1850 he led an expedition through the rocky country of Narah, and destroyed the Arab stronghold there. In January 1853, he became a general of division. He had the command of the first division of the French army under Marshal St Arnaud, sent to the Crimea in 1854; and at the battle of the Alma, was wounded in the breast and hand by the splinter of a shell. On the death of the marshal, C. took the chief command of the French army. In the war in Italy against the Austrians, in 1859, C. had the command of the third division of the French army; and at the battle of Magenta, June 4, his *corps d'armée* turned the left of the Austrians. In the great battle of Solferino, on the 24th of the same month, his division was hotly engaged, and lost 1000 men killed and wounded. In 1860, he married Miss Macdonald, a Scotch lady. When war was declared by France against Prussia, in 1870, he was one of the generals in command at Woerth, where the French received such a crushing defeat. C. was shut up in Metz with Marshal Bazaine, and was sent a prisoner into Germany on the capitulation of the fortress.

CANSO (Cape), the eastern extremity of Nova Scotia, and the southern boundary of the entrance of Chebucto or Chedabucto Bay. It is in lat. 45° 17' N., and long. 61° W.—2 (Strait), a passage of 17 miles in length and 24 in average breadth, connecting the inlet just mentioned with the Gulf of St Lawrence, so as to form an island of Cape Breton. Of the three channels between that inland sea and the open ocean, it is the one that is least frequently used by European vessels.

CANT, on shipboard, is a name given to such

## CANT—CANTEEN.

timbers, near the bow and stern, as lie obliquely to the line of keel. It is also a general term for anything sloping, inclined, or turned aside. ‘Canting’ is to turn anything over, or out of its proper position.

**CANT,** ANDREW, a Scottish divine of the 17th c., was first minister of Pitligo, in the north of Scotland, and afterwards in Aberdeen. In July 1638, he was one of the commissioners sent to that city, to compel the inhabitants to subscribe the National Covenant; and in November of the same year, he was a member of the memorable General Assembly, held at Glasgow, which abolished Episcopacy in Scotland. He was with the Scots army when it obtained possession of Newcastle, August 30, 1640; and in 1641, on the second visit of Charles I. to Scotland, C. preached before his majesty at Edinburgh. In 1660, in consequence of a complaint presented to the magistrates of Aberdeen, charging him with having published a seditious book, entitled *Lex Rex*, and with fulminating anathemas and imprecations against many of his congregation, C. relinquished his charge and left the town. He died about 1664.

**CANTA'BILE,** in Music, is found in several significations. In general, it is placed over passages of easy and flowing melody, as well in instrumental as vocal music. In songs, the melodies which lie chiefly in the middle region of the voice are marked C.: extreme tones of the voice have a peculiar timbre and character quite foreign to the cantabile. C. marked at the beginning of a piece means rather slow than quick. In the C. style the finest effects can be produced by the singer in swelling, sustained sound, the portamento, &c. C. is also called *contilene*.

**CANTABRI,** a rude race of mountaineers in ancient Spain, were of Iberian origin, and lived in the district now known as Burgos, and on the coasts of the Bay of Biscay, which derived from them its name, *Oceanus Cantabricus*. The most important of their nine towns were Julibrica (near the source of the Ebro), Vellica, and Concana. The C. are described as like the Scythians and Thracians in hardihood and martial character, sleeping on the bare earth, enduring extreme pain without a murmur, and, like most savages, leaving agricultural toil to their women. Their bravery was evinced in the Cantabrian war, a six years' contest with the Romans, begun under Augustus, and concluded by Agrrippa, 25–19 B.C. Tiberius afterwards stationed garrisons in the towns of the conquered C.; but some portion retreated into their fastnesses among the mountains, where they preserved their independence. They are supposed to be the ancestors of the Basques (q.v.).

**CANTA'BRIAN MOUNTAINS,** the general name of the several ranges of coast and boundary mountains, extending along the north coast of Spain, from Cape Finisterre, to the southern base of the West Pyrenees, and so dividing the coast districts from the interior elevated plateau of Castile. The summits of the mountains here and there reach the lower line of the snow region, with a more gentle slope on the south side, and forming plateau-districts from 1600 to 2000 feet high on the north, where the slopes are steeper and intersected by coast rivers, leave in several parts only narrow stripes of flat coast-land, and running out into the sea form several bold promontories. The whole group of mountains is named variously by the people of various localities, and includes the Sierra de Aralar, Salvada, Anagna, Sejos, Albas, and Altuna—all more or less wild and romantic, but having those fertile and prosperous trading districts which

distinguish the Basque Provinces and Asturias from the sterile central plateau of Spain.

**CANTAL,** a central department of France, formed out of the south portion of the old province of Auvergne. It has an area of 2090 square miles, and a population, in 1872, of 231,867. See AUVERGNE.

**CA'NTALIVER,** or CA'NTLIVER,

a large bracket used in architecture for supporting cornices, balconies, and even stairs. Cantalivers

are often highly ornamented. The accompanying example is from a stair at the corner of Randolph Crescent, Edinburgh.

**CANTARINI, SIMONE,** also known as SIMONE DA PESARO or IL PESARESE, an Italian painter, was born at Pesaro in 1612. He studied under Guido Reni at Bologna; but his intolerable arrogance made him numerous enemies, and in consequence he left the city, and went to Rome, where he won a high reputation, and was thought by many to excel even his master in the graceful finish of his brush. On his return to Bologna, he opened a school, but shortly after accepted an invitation from the Duke of Mantua to visit that city. Here also his excessive self-esteem involved him in disagreeable relations with everybody, and at last he quarrelled with the duke himself, on which he left for Verona, where he died in 1648, under suspicion either of having poisoned himself, or of having been poisoned by a Mantuan painter whom he had injured. C. was distinguished in modelling and flesh-colouring. A ‘Madonna upborne by Angels,’ and a head of Guido when old, in the gallery at Bologna; and others elsewhere, remain as proofs of his skill. His thirty-seven etchings closely resemble the etchings of Guido Reni, and have, in several instances, been fraudulently sold with the mark of this master forged upon them.

**CANTATA,** in Music, is a name given to a vocal composition; but it is so very indefinite, that it in no way shews in what respect such composition differs from any other. In Zedler of Halle's great *Lexicon*, the C. is defined as a ‘long vocal composition, the text of which is Italian,’ &c.; while in Sulzer's *Theorie der Schönen Künste*, it is said to be ‘a short piece of vocal music of a pathetic nature,’ &c. The C. is always more extended and wrought out than the simple song, and consists of different movements.

**CANTEEN,** is a refreshment-house in a barrack, for the use of the soldiers. The chief articles of food are supplied to the troops direct by the government; but malt liquor, spirits, and small grocery-ware, the soldier is left to buy for himself; and the C. is, or is intended to be, a shop where he could make these purchases economically without the necessity of going beyond the precincts of the barrack. Practically, however, they are little more than beer and spirit shops. One of the officers twice a week inspects the goods sold at the C., and occasionally insists on the price being lowered. No soldier is obliged to buy anything at the C.; he may lay out his small sums elsewhere if he prefers. Between the years 1836 and 1845, it was found that, among 112 canteens in the United Kingdom, the rent and head-money paid varied from £4 per annum (one at Guernsey) to £1344 per annum (one at Woolwich); they brought in collectively to the government about £70,000 annually. Great intoxication having resulted from the sale of spirits at the canteens, the War Office prohibited

## CANTEEN—CANTERBURY.

such sale in 1847; as a consequence, the rents had to be lowered to the extent of £20,000 in the following year, the cantineers finding their profits much reduced. The rent paid was found to be injurious to the soldiers, who were charged higher prices within the barrack than without, and who were thence driven to places where dangerous temptations are at hand. The results of this system being undeniably bad and demoralising, the War Office now makes the canteen a regimental establishment, controlled by a committee of officers and sergeants. The profits are applied for the benefit of the men of the corps.

In French barracks, the C. is a sort of club-room for the whole regiment. The cantineer is a non-commissioned officer, who acts merely as an agent for all, selling the liquors and commodities at prime cost.

**CANTEEN**, besides its application to a room or building, is a name also given to a vessel used by soldiers to contain whatever beverage may be obtainable on the march or in the field. It is sometimes of tin, sometimes of wood. In the British army, the C. is a wooden vessel, holding about three pints, painted blue, and inscribed with the number or designation of the regiment, battalion, and company to which the soldier belongs.

There is still another use of the word C., as a name for a leathern or wooden chest, divided into compartments, and containing the plate and table-equipage for a military officer when on active service.

**CANTERBURY**, a municipal and parliamentary borough, a county by itself, a cathedral city, and seat of the metropolitan see of all England, in East Kent, on the Stour, 56 miles east-south-east of London, on the high road from London to Dover. The distance from London by the South-Eastern Railway is 81 miles; by the London, Chatham, and Dover line, about 60. It stands on a flat between hills of moderate height. It has the aspect of an old town, many of the houses along the high street having gabled ends and projecting fronts. It has little manufacture or traffic. The chief trade is in corn, wool, and hops. Pop. (1871) 20,962. Many are engaged in the hop-gardens. C. returns two members to parliament. It is noted for its brawn. Some remains of the walls (1½ mile in circuit and 20 feet high) which formerly surrounded C., and one of the gates, still exist. Near the city wall is a large artificial mound, known as the Dane John (probably *Donjon*), and connected with this mound is a public garden, laid out in the end of the 18th c., from the top of which is a fine view of the country around. But the great glory of C. is its magnificent

**Cathedral**. When St Augustine became Archbishop of Canterbury, 597 A.D., he consecrated, under the name Christ's Church, a church said to have been formerly used by Roman Christians. Cuthbert, the 11th archbishop, 740 A.D., added a church to the east of this. In the course of ages, it received numerous additions, until it assumed its present magnificent form. Among those who helped to repair, enlarge, and rebuild it, were Archbishops Odo (940 A.D.), Lanfranc (1070), and Anselm (1093). In 1174 the choir was destroyed by fire, and in order to the rebuilding of it, a number of French and English artificers were summoned. Among the former was a certain William of Sens, and to him, a man of real genius, the work was intrusted. The church was rich in relics: Plegmund had brought hither the body of the martyr Blasius from Rome; there were the relics of St Wilfred, St Dunstan, and St Elfege; the murder of Thomas Becket (q. v.) had recently added a still

more popular name to the list of martyrs. The offerings at these shrines, especially the last, contributed greatly to defray the expenses of the magnificent work. William of Sens did not, however, live to see its completion. He was succeeded by another William, an Englishman, and to him we owe the completion of the existing unique and beautiful choir, terminated by the corona or circular chapel called Becket's Crown. Gervasius, a monk, who witnessed the fire of 1174, and has left an account of it, tells us that the parts of Lanfranc's church which remained in his time were the nave, the central and western towers, the western transepts, and their eastern chapels. In the 14th c., the nave and transepts were transformed into the Perpendicular Style of that period. The central tower, called the Angel Steeple, was carried up (1486—1504) to about double its original height, also in the Perpendicular Style; it is 234 feet high, and 35 feet in diameter. The north-west tower was taken down in 1834; it was 113 feet high, and divided into five stories. The Norman plinth still remains on each side of the nave in the side aisles, and portions of Norman ashlarings may still be seen about the transepts outside the west wall, and on the east piers of the great tower. The indiscriminate use of the 'Round' or 'Norman,' and the 'Pointed' or 'Early English' arch, is also a very striking feature in the eastern part of the building. The Lady Chapel, now called the Dean's Chapel, stands on the north side of the church, and was built in 1468; the roof is a fan-vault. The north transept is called the Martyrdom, for here took place the murder of Becket, on Tuesday, December 29, 1170. Fifty years later, his remains were translated from the crypt to a shrine in the newly erected Trinity Chapel, eastward of the choir. About the year 1500, the yearly offerings at this shrine amounted to £4000; but they had then declined much in value. A curious mosaic pavement still remains in front of the place where the shrine stood, and the stone steps which lead up to it are worn by the knees of countless pilgrims; but the shrine itself was demolished in 1538, and the bones of the saint burned by order of Henry VIII. In 1643, the building was further 'purified,' as it was called, by order of parliament. Still very many most interesting monuments remain—such as the tombs of Stephen Langton; that which is commonly, but wrongly, supposed to be the tomb of Archbishop Theobald; with those of the Black Prince, of Henry IV., of Archbishops Mapham, Peckham, Chicheley, Courtenay, Sudbury, Stratford, Kemp, Bourchier, Warham, and of Cardinal Pole. The total exterior length of the cathedral is 545 feet, by 156 in breadth at the eastern transept. The crypt is of greater extent and loftier—owing to the choir being raised by numerous steps at the east end—than any other in England.

The Archbishop of C. is primate of all England, metropolitan, and first peer of the realm. He ranks next to royalty, and crowns the sovereign. His ecclesiastical province includes all England, except the six northern counties. Among his privileges, he can confer degrees in divinity, law, and medicine. His seats are at Lambeth and Addington Park. He is patron of 149 livings, and has an income of £15,000 a year. There are fourteen old churches in C., mostly of rough flint, and containing fragments of still older structures. St Martin's Church stands on the site of one of the 7th c., and is partly built of ancient Roman brick and tile. Attached to the cathedral is a grammar school, remodelled by Henry VIII. Part of St Augustine's Benedictine Abbey still remains, with its fine gateway, near the cathedral. It occupied, with its

## CANTERBURY—CANTICLES.

precincts, sixteen acres. The old buildings have lately received large modern additions, in order to fit them for the purposes of a missionary college in connection with the Church of England. Another recent institution for education is the Clergy Orphan School, which occupies a conspicuous position on St Thomas's Hill, about a mile out of the city. The ruins of a Norman castle, 88 by 90 feet, the third in size in England, stands near the city wall. C. stood, in Roman times, at the union of two Roman roads from Dover and Lympne, the chief seaports of the Romans. C. was the capital of Kent, and the centre from which England was Christianised. St Augustine, the apostle of England, sent by Gregory I., was the first archbishop, and baptised King Ethelbert of Kent. C. was the Saxon *Caer Cant*, City of Kent, and capital of the kingdom of Kent. The Danes in the 9th, 10th, and 11th centuries often ravaged and burned the city. Henry VIII. confiscated the treasures of the cathedral, and Edward VI. levied fresh exactions from it. The cathedral suffered much in the parliamentary struggles, but it has since been repaired.

**CANTERBURY**, a settlement of about 2400 square miles, on the east coast of the Middle Island of the New Zealand group, with Christchurch as its capital, and Lyttleton as its port. The district was settled in 1850 by the Canterbury Association, a society of peers, bishops, and commoners interested in the colonization of New Zealand. It has a coastline of about 200 miles, and is well watered by numerous rivers. Gold has been discovered in the province, and a vast coal-bed seems to underlie the whole country, several mines being already in operation. On the eastern side of the great range of hills are the far-famed Canterbury Plains, the great sheep district of the colony—"three millions of acres rolling back in gentle rise forty miles to the foot of the central highlands, watered by twenty rivers, and spreading north and south further than the eye can reach." The natural pastures of C. are very fine; and to this circumstance is mainly due the rapid advance in prosperity of the country. Pop. (1871) 47,000. In 1871, wheat occupied 46,074 acres, yielding 1,006,266 bushels; oats, 44,370 acres, yielding 1,311,801 bushels; barley, 13,190 acres, yielding 308,908 bushels; and the yield of potatoes was 7136 tons. The holdings numbered 2526. Very excellent timber grows in many parts of the province.

**CANTERBURY BELLS.** See *CAMPANULA*.

**CANTHARELLUS.** See *FUNGI*, EDIBLE.

**CANTHARIDINE.** See *CANTHARIS*.

**CANTHARIS** (Gr. a small beetle, plural *Cantharides*), a genus of insects of the order *Coleoptera*, section *Heteromera*. See *COLOPTERA*. It belongs to a family called *Tetrachidae*, or necked beetles, the head being separated from the thorax by a distinct neck or pedicel, and forms the type of a subdivision of that family called *Cantharidiae*, many of the species of which possess blistering properties analogous to those of the common BLISTERING FLY, SPANISH FLY, or BLISTER BEETLE (*C. verickeris*). This insect, the best known and most important of the genus, is about an inch long; has a large heart-shaped head, rather broader than the thorax; thread-like antennae three times longer than the head; a nearly quadrangular thorax; and soft elytra (wing-covers) concealing the abdomen, and of equal breadth throughout. It is of a bright glossy green colour. The common Blistering Fly is found in the south of Europe, and in the south of Siberia. It is abundant in Italy, Sicily, and Spain, in the south of France, and in some parts of Germany and Russia. It is rare in England. The larva is not

well known. The perfect insect feeds on the leaves of the ash, privet, lilac, elder, and honeysuckle; and rests on them during the night, the day being its time of activity. It is therefore taken by beating the branches of the trees in the morning or evening, when it is comparatively lethargic, a cloth being spread below to receive the insects as they fall. The gathering of *Cantharides* takes place, in the south of France, in the month of May. It requires great caution to prevent injury to those who engage in it, the insects emitting a volatile substance with a strong smell, which causes inflammation of the eyes and eyelids, convulsive sneezing, and irritation of the throat and bronchial-tubes, nor can they be handled without danger of blistering. Those who collect them, therefore, generally wear gloves and veils. Unpleasant effects have been experienced from even sitting under trees on the leaves of which cantharides were numerous. Various methods are employed for killing cantharides when they have been taken; the cloths containing them are very generally immersed in hot vinegar and water, and they are afterwards carefully dried; sometimes they are killed by the vapour of vinegar, and sometimes by oil of turpentine. Unless kept with great care, they soon begin to lose their active properties, although, in stoppered bottles, they remain fit for use for years. They are very liable to be injured by mites, and afford a favourite food also to a kind of moth and to some other insects. They are imported into Britain from the south of Europe, and also from St Petersburg.

The active principle of the blistering flies is *cantharidine*, which possesses such powerful blistering properties, that  $\frac{1}{10}$ th of a grain placed on the lip rapidly causes the rise of small blisters. Administered internally, blistering flies cause heat in the throat, stomach, intestines, respiratory organs, &c.; and if in large doses, they give rise to inflammation of a serious nature, and sufficient to cause death. Externally, they are employed as a *blistering agent*. There are various medicinal preparations of blistering flies, such as *Vinegar of Cantharides*, obtained by macerating blistering flies in acetic acid; *Tincture of Cantharides*, procured by digesting blistering flies in proof-spirit, &c.; but that most commonly employed is *Plaster of Cantharides* or *Blistering Plaster*, obtained by mixing equal parts of blistering flies, yellow wax, resin, and lard. See *BLISTER*.

**CA'NTICLES**, a word which literally signifies songs, but which is specially applied to a canonical book of the Old Testament, called in Hebrew *The Song of Songs*—i.e., the most beautiful song. The author is commonly supposed to be Solomon, and in the rich luxurious splendour of its colouring, it admirably harmonises with the 'golden time' of that magnificent monarch. The theme which it celebrates is love; but what kind of love, whether earthly or spiritual, is a question that has perplexed biblical critics. The oldest interpretations are allegorical, and are either political or religious. The former of these, considered C. as the symbolical expression of a deep longing for the reunion of the kingdoms of Judah and Israel; the latter, of the love of God for his chosen people, the Jews. The religious interpretation passed over from Judaism to Christianity, and assumed a new aspect in consequence. Origen and Jerome found in Christ, the Beloved Bridegroom, and in the Church, the Bride. Similarly did Augustine and others explain the poem. Only among the theologians of the Syrian school, especially in that remarkable man Theodorus of Mopsuestia, do we find an effort made to adhere to more intelligible principles of interpretation, but the 'mystical view' obtained the upper hand. At the

Reformation, it was opposed by Erasmus, and adopted by Luther. It is still the popular view of the poem among orthodox theologians, many of whom have endeavoured to unfold its supposed spiritual or mystical meaning often with more ingenuity than wisdom. Whether C. is one song, an anthology of detached erotic idyls, or a whole formed of connected parts, is doubtful. Father Simon was the first to maintain the second of these opinions, which has been since advocated by Eichhorn, Jahn, Pareau, and others. Sir William Jones and Dr Mason Good adopt the third; Ewald, on the other hand, does not consider it idyllic at all, but maintains that it is a drama in five parts; while Boscuet regarded it as a pastoral eclogue, consisting of seven acts, each act filling a day, concluding with the Sabbath. Its object, according to Dr Davidson, 'appears to be to depict true, chaste love in humble life.'

CANTILENA. See CANTABILE.

CANTIRE, or KINTY'RE (Gaelic, headland), a long narrow peninsula of Argyleshire, running north and south between Arran Isle and the Atlantic, and united at the north end with the mainland of Scotland by the isthmus of Tarbet, a mile broad between East Loch Tarbet, a small loch or bay of Loch Fyne, and West Loch Tarbet. It is 40 miles long, and, on an average,  $6\frac{1}{2}$  broad. The surface is much diversified by low, undulating, moorish hills, with many lochs. The highest point is Bennear, 1515 feet. It contains much cultivated land. The north four-fifths of C., and the south-west corner round the Mull, or promontory, of Kintyre, consist chiefly of mica slate. Old red sandstone occurs on the south-east shore. Coal is found between Campbelton and the west coast. A light-house, 297 feet above the sea, stands on the Mull of Kintyre. C. includes 10 parishes. Pop. about 18,000. Campbelton (q. v.) is the chief seat of population. C. was in ancient times peopled by Picts and Celts more densely than the rest of Scotland. The Scots from Ireland subdued it in 210 A.D., were expelled from it in 446, but returned in 503 under Fergus, the first Scottish king, who fixed his seat at Campbelton. Kenneth II. (MacAlpine), on defeating the Picts in 843, removed to Forteviot. From the 8th to the 12th c., C. was occupied by Northmen from Scandinavia, and afterwards by the Macdonalds of the Isles, and more lately by the Campbells. Many burying-grounds and small ruined chapels or monasteries in C. shew its former populousness. Near these chapels, and in the villages, are many high, upright slate crosses, with rude figures and inscriptions on them. C. contains many ancient watch or ward forts often vitrified.

CANTO, in Music, an Italian term for the highest vocal part or treble. See also SOPRANO.

CANTO FERMO, in Church Music, means plain song, or choral song in unison, and in notes all of equal length. Its introduction into the Christian church is attributed to Pope Gregory the Great, before the invention of the modern notation. See also GREGORIAN TONES.

CANTON. In Heraldry, the C. occupies a corner of the shield, either dexter or sinister, and in size is the third of the chief. It is one of the nine honourable ordinaries, 'and of great esteem.'

CANTON (from the Fr. *canton*, a corner, a district; Ger. *kante*, a point, corner, border; allied to Eng. *canale*) signifies in geography a division of territory, constituting a separate government or state, as in Switzerland. In France, C. is a subdivision of an arrondissement.

CA'NTON, a large commercial city and port in the south of China, and capital of the province of

Kwang-tung (of which the name C. is merely a corruption). It is situated in lat.  $23^{\circ} 7' 10''$  N., and long.  $113^{\circ} 14' 30''$  E., on the north side of the Choo-keang, or Pearl River, in a rich alluvial plain, 32 miles from the sea. The river (the entrance to which is known by the name of the Boca Tigris, a Portuguese translation of the Chinese *Hu-mun*, 'Tiger's Mouth') is very picturesque. The city is surrounded by a brick rampart six miles in circumference, and entered by 12 gates, to each of which a guard-house is attached. It forms an irregular square, and is divided by a wall into the North and South, or Old and New City. The former is inhabited by the Tartar population, the latter by Chinese; and between the two, communication is maintained by four gates in the separating wall. The suburbs are very extensive, and in one of these, facing the river, stood the European factories or *hongs*. Most of the streets of C. are crooked and labyrinthine beyond description, but there are a small number of straight thoroughfares which make it easy enough for a stranger to find his way. As a rule, a tolerably straight street leads from the water-side to each gate of the city on the southern front, and is more or less prolonged through the interior. Many of the streets are devoted to distinct trades; thus, there is 'Carpenter' Street, 'Apothecary' Street, &c. The Joss-houses, chiefly Buddhist temples, are said to be 124 in number. The largest of these, on Honam Island, covers seven acres, and has 175 priests attached. It is called *Hae Chwang Sze*, or 'The Temple of the Ocean Banner.' Another famous structure is 'The Temple of the Five Hundred Gods,' situated in the western suburbs. There are also several many-storied towers or pagodas, a Mohammedan mosque, founded about A.D. 860 by the Arabian voyagers, who then were accustomed to visit C., a foundling-hospital, an English and an American missionary hospital. Streets of wooden houses were formerly to be seen on the river-side, but these were swept away during the late quarrel with Yeh; and one large site that they occupied is now walled in, preparatory to the erection of the new foreign factories, the old ones having been totally destroyed by fire. A very remarkable example of life upon the water is the boat-town of Canton. The total population of the city has been vaguely estimated at 1,000,000. The climate of C. may be pronounced healthy; though the heat from June to September is oppressive, and the thermometer sometimes, though rarely, stands at  $100^{\circ}$  in the shade. In ordinary years, the winter minimum is  $42^{\circ}$ , and the summer maximum  $96^{\circ}$ . The north-east monsoon commences in October, and is the prevailing wind till March, when the south-west monsoon sets in. Its average temperature is  $70^{\circ}$  F., and the annual fall of rain  $70\frac{1}{2}$  inches. The Cantonese are notorious for their turbulence and hatred of foreigners, and the European factories have more than once been attacked by infuriated mobs, who were only kept at bay by force of arms. This hostility may, however, be greatly due to the baneful influence of those in power; for here the government of the mandarins of the present Manchu Tartar dynasty appears to have reached its maximum of corruption and barbarity, and was fitly represented by the notorious Yeh, late governor-general of Kwang-tung and Kwang-sa. The author of *Twelve Years in China* gives us some startling facts illustrative of mandarin rule in this part of China. After the defeat of the Triad rebels, who besieged C. in 1844—1845, it is estimated that 1,000,000 of people perished in the province.

The admirable situation of C. for conducting traffic explains how, from an early period, it was a favourite port with foreign merchants. The Arabs,

## CANTONMENTS—CANVAS.

as has been said, made regular voyages hither as early as the 9th century. The Portuguese found their way to it in the 16th century, and were followed by the Dutch a hundred years later. These in turn were overtaken and supplanted by the English before the close of the 17th century, and an immense trade was carried on by the agents of the East India Company. Their monopoly ceased on the 22d April 1834. Since that date the proceedings of the C. government officers have originated two wars with the British. The city was captured by the allied French and English forces December 1857, and continued to be garrisoned by them till October 1861. See CHINA. After the treaty of Nankin (signed Aug. 29, 1842), C. was known as one of the five ports; Amoy, Foochow, Ningpo, and Shanghai having also been thrown open to foreign commerce.

The chief exports from C. are tea, silk, sugar; the chief imports, raw cotton, piece-goods, opium, metallic wares, &c. ‘War and rebellion’ (say the authors of the *Treaty Ports of China and Japan*, Lond. and Hong-kong, 1867), ‘the opening of Hankow as a shipping port for tea, and, above all, the proximity of Hong-kong and Macao to the deltae of the Canton River, with its unrivalled facilities for smuggling, have robbed C. of the pre-eminence it so long enjoyed in commercial prosperity.’ Yet the following table (Consular Reports, 1872), giving a comparative statement of the value of the C. trade from 1860 to 1871, shews that the city is recovering ground:

	Total Value of Imports in Mexican Dollars.	Total Value of Exports in Mexican Dollars.
1860,	18,415,727	16,257,623
1861,	12,977,353	15,811,513
1862,	10,580,928	17,742,590
1863,	9,505,285	16,083,062
1864,	8,192,785	13,659,177
1865,	10,556,602	18,064,577
1866,	14,171,101	18,832,622
1867,	14,090,581	18,403,154
1868,	12,991,266	18,491,156
1869,	11,487,679	20,010,628
1870,	12,053,394	19,857,643
1871,	15,661,889	23,612,489

*The Middle Kingdom*, by Dr S. W. Williams; *The Chinese*, by Sir John Davis; *Meadow’s Chinese*; *Twelve Years in China* (Edin. 1860); *Report of the Missionary Hospital in the Western Suburbs of Canton*; *Treaty Ports of China and Japan* (Lond. and Hong-kong, 1867).

CANTONMENTS, in the general operations of European armies, are temporary resting-places. Many circumstances, especially the state of the weather and the supply of food, influence a general in determining whether to go into C. or to encamp, in the intervals between active operations; or he may take the former course during an armistice. The quartermaster-general previously examines the district, and determines how many men and horses to place in each village; arrangements are also made for a main-guard, cavalry pickets, alarm-posts, road-barricades, lines of sentries, mounted orderlies, &c., to guard against a sudden surprise from the enemy. In C. the men are not generally under canvas, as described in CAMP.

In India, C. are permanent places, regular military towns, distinct and at some little distances from the principal cities. If on a large scale, such a cantonment contains barracks for European cavalry, infantry, and artillery; rows of bungalows or houses, each enclosed in a garden, for the officers; rows of huts for the native soldiery; magazines and parade-grounds; public offices and buildings of various kinds; and a bazaar for the accommodation of the native troops. During the revolt in 1857–1858, most of the outbreaks began in the cantonments. It was in the cantonment outside Cawnpore that Nana Sahib commenced his treachery.

576

CANTONNÉE, in Heraldry. When a cross is placed between four other objects, e.g., scallop shells, it is said to be cantounée.

CA'NTON'S PHOSPHORUS, or PYROPHORUS, is obtained by heating in a close vessel 3 parts oyster-shells and 1 part sublimed sulphur, when the sulphuret of calcium (CaS) is formed, which takes fire when exposed to or thrown into the air.

CANTOR. See PRECENTOR.

CANTU, CESARE, one of the best of modern Italian authors, was born September 5, 1805, at Brescia, in Northern Italy, and was educated at Sondrio, where he was appointed professor of *belles-lettres*. Having been imprisoned for the offence of expressing liberal tendencies in a historical work on Lombardy, C. spent his leisure hours in describing the sorrows of a prisoner in the form of a historical romance, *Margherita Pusterla* (Florence, 1845). C. has also written several religious hymns and songs, which have become popular; but his great work is the *Storia Universale* (35 vols., Turin, 1837–1842). His *History of Italian Literature* appeared in 1851; *History of the Last Hundred Years*, 1852; *History of the Italians*, 1859; and *Milano, Storia del Popolo e del Popolo*, 1871.

CANTUBIO, or CANTU', a town of Northern Italy, 5 miles south-east of Como. It is situated in the midst of a rich district, has a church with an elegant tower, which served as a beacon during the middle ages, and manufactures of iron-wares. Pop. 5500.

CANUN, a Turkish musical instrument, strung with gut-strings; is played on by the fingers, on which are thimbles of tortoise-shell, pointed with pieces of coco-nut, forming plectra for striking the strings with. The C. is a favourite instrument with the ladies in seraglios, many of whom produce very pleasant music and harmony on it.

CANUTE, king of England, succeeded to the command of the Danes in England on the death of his father, Swein or Sveyn, and was by them proclaimed king of England. On the death of Ethelred, he shared the sovereignty with Edmund Ironside, who ruled over the south, while C. was monarch over the north of England. The sudden decease or assassination of Edmund made C. sole ruler in 1017, and he continued to reign until his death, in 1035 or 1036. His rule was marked at first by cruelty, but when all who were likely to interfere with his power had been disposed of, he exhibited great mildness and justice, combined with talent and judgment. The Anglo-Saxons, whose complete subjugation he had effected, did not feel their chains: they had experienced no such good government since the time of Alfred and Athelstane. He was easily accessible to all his subjects; and won the hearts of the people by his love for old ballads and songs, and his liberal patronage of minstrels and of gleemen. He also wrote verses himself, and one ballad—all of which, with the exception of one verse, has been lost—long continued popular among the peasantry. In his latter years he became very religious, made a pilgrimage to Rome, and built monastic establishments.

CANVAS, regarded from an artist's point of view, is the principal material upon which oil-paintings are made. Two kinds are prepared for this purpose, of which the best is called *ticking*. Before it is put into the artist's hands, it is usually *primed*, or grounded (see GROUND) of a neutral gray, or other tint, as he may direct. Certain sizes of C. being in greater request than others, are kept ready stretched on frames. Those used for portraits are

known by the names of *kit-cat*, which measures 28 or 29 inches by 36; *three-quarters*, 25 by 30 inches; *half-length*, 40 by 50; *Bishop's half-length*, 44 or 45 by 56; *Bishop's whole length*, 58 by 94.

CANVAS, SHIP'S. See SAIL, SAILCLOTH.

CANZO'NÉ is the name of one of the oldest and most prized forms of the Italian lyric. The word is borrowed from the Provencals, whose *cansos* or *cançons*, however, were not restricted to any precise form, but were simply verses intended to be sung. The Italian writers first attempted to regulate the wayward and arbitrary character of the Provencal *cansos*; Dante, and subsequently Petrarch, being especially successful. The *Canzone Petrarchesca* or *Toscana* was any considerable lyrical poem, composed of stanzas exactly corresponding to one another in number of lines, measure, and position of rhymes, and which customarily closed with a short stanza. About the end of the 16th c., the Italian writers began to deviate from the strict form of the Petrarchian canzone. Torquato Tasso and Chiabrera are the most notable names in the new movement. The most of the canzoni of the latter—called by their author *canzonette*—are written in short lines and stanzas, the position of the rhymes being also completely arbitrary.

CAOUTCHOUC, GUM ELASTIC, or INDIA RUBBER, a substance which, on account of its peculiar properties, is extensively used in the arts, and of which the use is continually and rapidly increasing. It is one of the products of the wonderful chemistry of nature, being found in the milky juices of plants, and most abundantly in the natural orders *Moraceæ*, *Artocarpaceæ*, *Euphorbiaceæ*, *Apocynaceæ*, *Asclepiadaceæ*, and *Papayaceæ*. It exists in the milky juice of plants growing in temperate climates; but it is only in tropical and subtropical countries that it occurs so abundantly as to be of economical importance. Its uses to the plants in which it is elaborated have not been ascertained; and the conjectures of theorists on this subject are not supported by arguments sufficient to give them much probability. In the milky juice, the C. is diffused in the form of minute globules, and not, strictly speaking, in solution; and when the juice is extracted from the plant, and allowed to stand for a short time, these globules separate from the watery part of it, and form a sort of cream on the top, or, in close vessels, appear throughout it as a flaky coagulum. Caoutchouc, as well as some of its useful and curious properties, must have been known in America at a very early period, because balls made of the *gum of a tree*, lighter and bouncing better than the wind-balls of Castile, are mentioned by Herrera when speaking of the amusements of the natives of Hayti, in his account of Columbus's second voyage. In a book published in Madrid in 1615, Juan de Torquemada mentions the tree which yields it in Mexico, describes the mode of collecting the gum, and states that it is made into shoes; also that the Spaniards use it for waxing their canvas cloaks to make them resist water. More exact information regarding caoutchouc was afterwards furnished by M. de la Condamine, who visited South America in 1735, but it is curious to note that some of the purposes for which india-rubber is most extensively used at the present time are the same as those for which it was employed in South America nearly three centuries ago. It was at first known by the name of *Elastic Gum*, and received that of india-rubber from the discovery of its use for rubbing out black-lead pencil marks, for which purpose it began to be imported into Britain in small quantities about the end of last century, being much valued by artists, and sold at a high

price. Even before this time its employment for the manufacture of flexible tubes for the use of surgeons and chemists had been successfully attempted; but the expensive character of the solvents then known for it, prevented its general application to any purpose in the arts. It was not till 1820 that its employment began to extend beyond the rubbing out of pencil marks, although in the meantime the quantity imported had considerably increased. Its application to the manufacture of water-proof cloth first gave it commercial importance. About the same time a method was discovered of fabricating articles of various kinds by casting caoutchouc in moulds. Its elasticity and flexibility, its insolubility in water, and its great impenetrability to gases and fluids in general, have now been found to adapt it to a great variety of uses; but for by far the greater number of its applications it is now employed in the vulcanised state.

The caoutchouc of commerce is obtained most largely from South America, but considerable quantities are also procured from British India, the Indian Archipelago, the West Coast of Africa, and the Mauritius. During the year 1872, the actual imports of this material into Great Britain were:

	Cwts.
From Brazil,	68,143
" New Granada, Ecuador, and Central America,	16,390
" British India,	18,855
" Strait Settlements,	15,996
" West Coast of Africa,	14,135
" Mauritius,	10,433
" Other Countries,	18,862
Total,	157,114

In 1852 the total imports were only 15,269 cwts., and in 1862 they were 59,703 cwts. The average annual yield of Brazil for the five years preceding 1871, according to a table sent from that country to the Vienna Exhibition of 1873, was about 5,000,000 kilogrammes, or nearly 100,000 cwts., but not more than one-half of this came to Great Britain.

Brazilian caoutchouc is the product of several species of *Siphonia* (natural order *Euphorbiaceæ*), but chiefly *Siphonia elastica*. Bates says that 'this tree is not remarkable in appearance; in bark and foliage it is not unlike the European ash, but the trunk, like that of all forest trees, shoots up to an immense height before throwing off branches.' The caoutchouc of New Granada, Ecuador, and Central America is obtained from *Castilla elastica* (nat. ord. *Artocarpaceæ*), that of East India from the beautiful glossy-leaved *Ficus elastica* (nat. ord. *Moraceæ*), now so common as an ornamental plant in our conservatories, that of Borneo from *Urceola elastica*, and that of Western Africa from several species of *Landolphia*, and perhaps also *Ficus*. Species of *Vahia*, *Willughbeia*, *Euphorbia*, and other genera likewise yield useful varieties of caoutchouc, and the sources of some kinds are unknown.

Caoutchouc is sometimes collected by cutting the trees down, but much more usually by making simple incisions in the trunks. The method of collecting and preparing the liquid caoutchouc is thus described in a work recently published at Rio Janeiro. In a few hours, the juice which flows out fills the basins, made of large leaves and plastic clay, which are adapted to the lower part of the tree. It is then poured into other vessels of various shapes; in a short time it becomes thickened, and solidifies in consequence of the evaporation of the liquid part. In order to dry it completely, the practice is to expose it to a gentle heat; for this purpose it is suspended over a brasier lighted with wood, and the flame maintained with the fruits of auricuri, in such a manner that it may receive the smoke, hence

## CAOUTCHOUC.

the blackish colour which the caoutchouc of commerce generally presents. Whilst it is liquid, it is fashioned by means of moulds, according to the purposes to which it is destined. An attempt has recently been made to import the juice of the tree, and subject it to the drying process in this country, but little has as yet been imported into Britain. The characters of the juice are, that it possesses the consistence of cream, has a yellow colour, is miscible with water, but not with naphtha or other of the solvents of ordinary caoutchouc, and its specific gravity varies from 1·02 to 1·41—ordinary caoutchouc being 930. The juice contains about 30 per cent. of caoutchouc. When heated, it coagulates (as the glaire of egg does), owing to the presence of albumen; and exposed to the air, it dries up, and leaves a film of caoutchouc. In the preparation of pure caoutchouc, the natural juice is mixed with five or six times its bulk of water, and then either heated or mixed with common salt or hydrochloric acid, when the pure caoutchouc separates as a white opaque substance, which becomes transparent when dry. Pure caoutchouc is a carbo-hydrogen, its composition being carbon 87·5 and hydrogen 12·5.

Para caoutchouc is the best, and commands the highest price in the market. The other South American kinds are of medium quality. East Indian rubber—naturally a fine quality—is too often injured by adulteration and careless collecting. The poorest kind is the West African, being clammy, offensive in its odour, and only slightly elastic.

Commercial C. is a tough fibrous substance, possessing elastic properties in the highest degree. Reduced to the temperature of freezing water (32° F.), it hardens, and in greater part, if not entirely, loses its elasticity, but does not become brittle. When heated, as by placing in boiling water, it softens, and becomes very much more elastic than at ordinary temperatures, though it does not in any degree dissolve in the water. If suddenly stretched to seven or eight times its original length, it becomes warm; and if kept in this out-stretched form for several weeks, it appears to lose, in great part, its elastic properties, and in this condition is readily cut into those thin threads which are used in the elastic put in gloves, bonnets, &c., and the elasticity of which is readily renewed by the application of gentle heat. Of late years, however, elastic thread is usually prepared with vulcanised rubber. Commercial caoutchouc is insoluble in water and alcohol, is not acted upon by alkalies or acids, except when the latter are concentrated, and heat is applied; but is soluble in ether, chloroform, bisulphide of carbon, naphtha, petroleum, benzol, and the essential oils of turpentine, lavender, and sassafras. Many other essential and fixed oils, when heated with C., cause it to soften, and produce thick glutinous compounds, especially linseed oil, which, in the proportion of 1½ lb. of the oil to 4 oz. C. in thin strips or films, yields a solution which, when strained, is of great use in rendering shoes, cloth, &c., waterproof. When heated to 245° F., C. fuses; and at 600° it is volatilised, at the same time undergoing decomposition, and yields a liquid called *Caoutchoucine* or *Caoutchisine*, with the specific gravity 680, and possessing great solvent powers over C. and other substances. Caoutchoucine is necessarily very expensive, and hence its use is limited; but cordage steeped in it and dried acquires great supple and tenacious properties, and cloth saturated with it, and dried by exposure to the air, becomes watertight.

In the employment of C. as a branch of manufacture, the first operation is the purification of

the crude material as it comes from abroad. The crude material is cut into minute shreds, and washed by powerful machinery, immersed in water, which releases the solid impurities, and the pure C. being removed, is placed on iron trays, and dried in a room heated by steam. The material then undergoes a process of kneading under very heavy rollers, which causes the adhesion of the various pieces of C. to each other, and ultimately yields a mass or block of C. in which the condensation is so perfect that all air-holes, and other cells and interstices, disappear. The block of C. is then cut under water by powerful knives or shears into sheets, from which the pieces sold by stationers may be shaped out, or from which C. bands or thread may be obtained. In the manufacture of square threads, mere cutting is had recourse to; and the delicacy of the operation may be understood when it is stated that one pound of C. will yield 32,000 yards of thread. The round thread elastic is prepared from C. which has been treated with about double its weight of bisulphide of carbon, containing about 5 per cent. of alcohol, which yields a soft material resembling in consistence bread-dough or putty; and this being squeezed through a series of small holes, is obtained in minute round threads, which are first received on an endless piece of velvet, and ultimately on an endless web of common cloth 500 to 600 yards long, during the transit of the threads across which, the solvent or bisulphide of carbon evaporates, and leaves the caoutchouc. When it is wished to weave these threads into cloth, they are wound upon bobbins, taking care to stretch the C. as much as possible, so as to deprive it, for the time being, of its elasticity; and after it has been woven into the cloth, a hot iron is passed over the fabric, and immediately the C. resumes its elasticity.

In the manufacture of water-proof clothing, or Mackintoshes (see MACKINTOSH), which was the first application of rubber on a large scale, the caoutchouc is made into a solution with spirits of turpentine, or other solvent, and spread upon the cloth; when thus coated, the fabric is pressed between heavy rollers. This variety of water-proof cloth has now, however, been almost entirely superseded by another kind made with vulcanised rubber, which we shall notice presently.

*Vulcanised Caoutchouc.*—Pure india-rubber is now used only to a limited extent in the arts, but it is applied in the vulcanised state to an almost endless variety of purposes. The remarkable change which caoutchouc undergoes when mixed with sulphur and heated, according to circumstances, from 240° to 310° F., was discovered by Charles Goodyear, in America, in 1843, and independently, about the same time, by Mr. Thomas Hancock, in England. In the process of vulcanising, the rubber, as a preliminary step, is either torn into shreds or crushed into thin pieces by machinery, and afterwards washed. There are two principal kinds of vulcanised rubber, one hard and horny in its texture, the other soft and elastic. In the case of the former, the caoutchouc is mixed with about one-third of its weight of sulphur, and heated for several hours, the temperature finally rising to fully 300° F. For the soft kind of vulcanised rubber, on the other hand, a much smaller proportion of sulphur is required—namely, from 2½ to 10 per cent., and the heat to which it is subjected in the vulcanising chamber is considerably less. Usually, too, with this latter kind, the articles are made before the rubber is heated. The sulphur is commonly added in the ground state, but sometimes the rubber is treated with some solution containing this element, such as the bisulphide of carbon.

Although sulphur is the only essential ingredient required for vulcanising rubber, yet other substances are usually added. Thus, in the case of machinery belting, pipes, and some other articles, the silicate of magnesia (French chalk) is used to prevent adhesiveness. Litharge, or carbonate of lead, again, is frequently mixed with the rubber and sulphur for certain purposes; but there is really a long list of materials more or less used in preparing different qualities of vulcanised caoutchouc, each manufacturer using mixtures, the exact nature of which he is careful not to divulge. Asphalt, tar, lampblack, whiting, rosin, sulphide of antimony, and ground cork are some of the ingredients most commonly employed in this way. Belting for machinery, and some kinds of tubing, are formed of alternate layers of canvas and vulcanised rubber.

Natural caoutchouc, as already stated, is elastic, cohesive, impervious to gases, insoluble in water, and resists many chemical re-agents; but it loses its elasticity by cold, softens by heat, and is destroyed by many fixed oils. After being vulcanised, caoutchouc has its elasticity greatly increased, is not hardened by cold, and does not soften or become viscid at any temperature short of its absolute decomposition. Besides, it is barely soluble in turpentine, naphtha, and the other solvents of pure caoutchouc; nor does oil readily penetrate or soften it.

It would be a hopeless task to attempt to specify the many useful purposes to which vulcanised caoutchouc is applied, even if we had the space to spare. From the year 1843, when it was first made, to the present time, the various patented applications of it must be two or three thousand in number. The mere abridgments of the specifications connected with this material, issued by the English Patent Office, form a thick volume. Under the head GOLOSSES, will be found a brief description of the process of making india-rubber shoes. Water-proof coats are now made in a similar way, the mixture of rubber and vulcanising materials being pressed on the surface of any suitably woven fabric by heated iron rollers in a calender. The coats are then cut out and the various pieces put together, without sewing, by some solvent, such as turpentine, which makes the edges adhere. They are afterwards heated in the vulcanising chamber. Both coats and shoes of this material have, however, the objectionable property of preventing the escape of moisture from the skin. Belting, buffers, wheel tires, washers, valves, pipes, fire-hose, and other engineering appliances, form a large branch of the rubber trade. For medical and surgical purposes, many articles are made of this material. Of such an apparently trivial matter as vulcanised rubber thread, one English firm turns out about 3000 lbs. per day, and another single small article—namely, tobacco pouches—is made in another factory at the rate of 3000 per diem.

Hard vulcanised rubber, termed vulcanite, and sometimes ebonite, is made into a great many small articles, such as combs, chains, bracelets, boxes, pen-holders, paper-knives, knife-handles, buttons, &c., as a substitute for materials like horn, bone, ivory, and jet. As in the case of these substances it is formed into various objects by moulding, cutting, carving, polishing, and other processes. Vast numbers of these articles are now sold, but some time must yet elapse before the quality of this material is thoroughly tested. The black colour of vulcanite ornaments has still a tendency to turn gray, but the brittleness which was a fault of combs made of it a few years ago, seems to be overcome. With respect to objects of considerable size, vulcanite has been made into furniture, ornamental tiles, and even

rails for railroads. A kind of vulcanite is now very largely employed as an insulator in electric cables, experience having shewn that there are certain objections to gutta-percha being used for this purpose.

There are some useful applications of india-rubber in the liquid or semi-liquid state, which it is worth while to note; thus, when melted at 398° F., and mixed with half its weight of slaked lime, it forms a useful cement or lute, which can be easily loosened, but it will dry and harden if red lead is added. A very tenacious glue is formed by heating caoutchouc, coal tar, and shell-lac together. It forms an ingredient in some special kinds of varnishes, and it also improves the lubricating qualities of mineral oils, when a small quantity is dissolved in them.

In Great Britain there are six or eight large india-rubber factories, each employing from 400 to 600 hands, besides a great number of smaller works. The manufacture of caoutchouc is also an extensive industry in the United States, and in some continental countries, especially France. According to an estimate made by M. Ballard in 1867, the annual French consumpt of raw india-rubber was then 180,000 lbs., the value of which in a manufactured state was fully £3,000,000. This would indicate that the industry is more largely developed in France than in England. In most india-rubber factories a large number of the work-people are females; and with respect to the operatives engaged in them generally, there is this peculiarity, that as no great skill is required on their part, employment in such works has proved quite a boon to many persons who have never learned a trade.

CAP, in Ship-building, is a strong, thick block of wood fixed near the top of each mast; it has a hole to receive the upper end of the lower mast, and another to receive the lower end of the topmast, with eyebolts to aid in hoisting the topmast. There is also a C. of smaller size at the point of junction between the topmast and the top-gallant-mast. When made of iron, the C. is called a crane.

CAP. See PERCUSSION CAPS.

CAP OF MAINTENANCE, or DIGNITY, is a cap worn by noble and royal personages on certain state occasions. Such a cap was sent by Pope Julius II. to King Henry VIII., for writing his book against Martin Luther.

CAPA'CITY, LEGAL, is such a condition of individuals, in regard to their natural qualities and actual position under the constitution of the country, as fits them for the application of the laws civil and criminal. Generally speaking, all persons have this legal capacity excepting *aliens*, persons *attainted*, *convicti*, *insane* persons, and to some extent also *infants*, *feminae coverti* or married women, and persons under *duress*; see these heads. See also CONVEYANCE, CONTRACT, PLAINTIVE, PURSUER, DEFENDER, SUIT.

CAP-À-PIE' (Fr. head to foot), in the military language of the middle ages, was applied to a knight or soldier armed at all points, or from head to foot, with armour for defence and weapons for attack.

CAPARISONED, in Heraldry. A war-horse completely furnished for the field is said to be caparisoned.

CAPE, in Geography, the extremity of a portion of land projecting into the sea beyond the general line of the shore. On a low sandy coast, a cape generally forms an obtuse angle, being merely a change in the trending of the land. On rocky shores, capes usually form acute angles, and are here sometimes called points or promontories.

## CAPE BRETON—CAPE OF GOOD HOPE.

**CAPE BRETON**, a rocky island of irregular form in British North America, stretching in N. lat. between 45° and 47°, and in W. long. between 60° and 61° 30'. It is separated from the peninsula of Nova Scotia by Chebucto or Chedabucto Bay and the Gut of Canso, contains 3120 square miles, with a population (1871) of 26,454. Its principal exports are pine, oak, birch, maple, fish, and coal. Though the island produces maize and other grains, yet it depends for its bread-stuffs chiefly on the United States. C. B., originally a French possession, was taken by the English in 1745; but being subsequently restored to France, it was again captured in 1758, and ceded in 1763. After having been for a time a distinct colony, it now forms part of the province of Nova Scotia. The towns are Sydney, Arichat, and Port Hood, the once famous Louisbourg, stripped of its fortifications, having become merely a village.

**CAPE COAST CASTLE**, the chief settlement of Great Britain in North or Upper Guinea, lat. 5° 5' N., and long. 1° 13' W. The place, as its name implies, is defended by a fort, or rather by three forts. It has a population of 10,000. During 1871, the external trade of the entire Gold Coast, C. C. being the capital, was as follows: imports, £250,672; exports, £295,208: total, £545,880. Under the latter head, the principal articles were palm-oil, gold-dust, tortoise-shell, and maize.

**CAPE COD**, properly a narrow peninsula of Massachusetts, which, with a length of 65 miles, forms the south-east boundary of the great bay of that state. The northern extremity, marked by a revolving light 155 feet high above the level of the sea, is in lat. 42° 3' 40" N., and long. 70° 14' 48" W.

**CAPE HATTERAS**, a dangerously low point of North Carolina, United States, in lat. 35° 14' N., and long. 75° 30' W. It forms the eastern extremity of the insular banks of the same name, projecting virtually into the Florida Stream, and marking the spot where the coast-line abruptly turns from the direction of north-east to that of due north.

**CAPE HA'YTIËN** (formerly called *Cape Français* and *Cape Henri*), a seaport town, of the island of Hayti, on its north coast, in lat. 19° 40' N., long. 72° 54' W. It is pleasantly situated on a small bay, partly encircled by hills, has wide and well-paved streets, and some handsome squares. A great portion of it, however, is in ruins, the effects of the revolutionary wars at the end of last century. Safe anchorage is found within the harbour, which, however, is rather difficult of access. C. H. carries on a considerable trade with the United States. Population stated at from 12,000 to 16,000.

**CAPE HORN**, or **HOORN**, the most southerly point of America, terminating an island of its own name, in the archipelago of Tierra del Fuego. It is in lat. 55° 58' 40" S., and long. 67° 16' W., having a perennially antarctic climate, and being in itself merely a detached link, bare and rugged, of the chain of the Andes. It was discovered by Schouten, a native of Hoorn in Holland, about 90 years later than the Strait of Magellan, and since then the course of navigation has been round the cape instead of through the strait.

**CAPE LA HAGUE**, a promontory of France, forming the north-west extremity of the peninsula of Cotentin, in the department of Manche. It juts out into the English Channel, opposite the island of Alderney, and about 16 miles north-north-west of Cherbourg, and 50 miles south of St Alban's Head, in Dorsetshire.

**CAPE LA HOGUE**, often confounded with Cape la Hague, is situated on the east side of the same

peninsula. Here the united English and Dutch fleets defeated the French in 1692.

**CAPE OF GOOD HOPE**, popularly regarded as the most southerly promontory of Africa, though it is half a degree to the north of Cape Agulhas. The latter is merely a projection on a coast-line, which diverges inconsiderably from a parallel; but the former is really the turning-point from south to east on the voyage from Europe to India. This celebrated promontory is in lat. 34° 22' S., and long. 18° 29' E., being the termination of Table Mountain, which, as it recedes towards the bay of its own name, rises from the height of 1000 feet above the sea to that of 3582. The Cape (for so it is called by way of eminence) was discovered and doubled by Diaz, a Portuguese navigator, as early as 1486—six years before Columbus, in aiming at the same goal by a different route, led the way to America. But it was only in 1497 that Vasco da Gama realised the value of Diaz's discovery, by rounding it on his adventurous voyage from Lisbon to Calicut. The result was not merely to open a new channel for the traffic of the East, but it was also to transfer trading superiority from the republics of Italy to the states of Western Europe.

**CAPE OF GOOD HOPE**, a British colony, was so called from the cape on its south-western extremity. It was established by the Dutch in 1652, some attempts at a settlement having been previously made by the Portuguese. The former only intended it at first as an intermediate station between Holland and their East Indian possessions; and at first occupied only a small tract of ground on the slopes of Table Mountain, with some portion of the adjoining flats; but they had in their neighbourhood scattered tribes of improvident natives, singularly feeble of purpose, and incapable of organisation on a large scale. The tide of immigration set in from Holland, and when the country was finally taken possession of by the British in 1806 (there having been a brief occupation of it from 1796 till 1803), the Dutch had extended their dominion as far to the east and north as the mouth of the Great Fish River, and from that point in a waving line across the country to the west.

In entering upon the government of this large territory, the British found themselves face to face with a race of a totally different sort from that of the purposeless Hottentot—a people styled Kaffirs, mainly of Arab descent, consisting of tall, athletic, finely formed men, of warlike dispositions, with an incurable propensity to steal from any one, provided he was not of their own tribe, and particularly so if he was a foreigner. The inevitable result was a succession of wars—those, namely, of 1812, 1819, 1828, 1835—1836, 1846—1847, 1851—1852. The consequence was, that the Kaffirs were driven back, and at present the colony, on its north-east corner, has reached as far as the mouth of the river Kei.

The colony is bounded N. and N.E. by the Orange River, which divides it in part of its course from the Free State Republic; E. and N.E. by the Tees, a small tributary of the Orange, the Stormbergen Mountains, and the Indwe and Great Kei, which two rivers separate the Cape Colony from Kaffir-land; on the S. the Indian Ocean bounds it; and on the W. the Atlantic. Lat. 28° 10'—34° 51' S., long. 16° 20'—28° 20' E. The breadth on the greatest meridian is about 450 miles, the length on the largest parallel about 600 miles, and the number of square miles is considerably more than 200,000.

The highest range of mountains within the colony is 9000 feet above the sea. The mountains keep

## CAPE OF GOOD HOPE.

at a distance from the coast-line of about 100 miles, and receive different names in their course, such as the Stormberg, Sneeuberg, Nieuwveld, Roggeveld, and Kamiesberg. Between this principal range and the sea on the east, there are two other ranges less continuous and regular, the intermediate one generally more distant from the first than they are from each other.

South Africa being not far from the region of the trades, south-east winds prevail, especially in the summer-time; the only other wind that may be said to blow is that from the north-west, which prevails during the colder months. But whichever of these two winds predominates—the one bearing a supply of rain from the Indian Ocean, the other, if less frequent, more richly laden from a part of the Atlantic nearer the line than the country which it fertilizes—it fails to deposit its stores on the opposite side of the principal water-shed which crosses its path. Hence the curious fact of the transposition of seasons in the same latitude. As the harvest in such latitudes depends more on the supply of rain than anything else, people are reaping on the one side of the country whilst they are sowing and planting on the other. Certain parts of the country are liable to long-continued droughts, because while very heavy rain-falls take place, the rain is confined to a particular part of the year. The country, however, is admirably adapted for the storage of water. In many places one meets with the successive beds of dried-up lakes, with a narrow outlet at the lower ends, through which a periodic stream flows. By closing up this outlet, artificial lakes or dams may be formed to almost any extent, and of unlimited number; and from the steepness of the slope, the lands lower down admit easily of being laid under water.

As regards minerals, the diamond fields are in Griqua-land (q. v.), till recently beyond the limits of the colony, and in the Free State. In 1874, the lieutenant of West Griqua-land issued an order for the better management of diggings and mines of precious stones and minerals, in which he requires that miners shall have a certificate, dealers a license, and the mines be under official inspection. This ordinance created a great outcry against it by a great body of dealers; but it seems necessary that such protection should shield the weak and the dealer who wishes to trade according to recognised law. Gold is confidently reported to have been found in the Trans-Vaal in payable quantities; but the only mineral within the colony which has greatly added to its wealth is the rich copper ore found in Namaqua-land.

There is in the colony almost a total want of navigable rivers, and railways have been little more than commenced. Already the copper mines are connected with Port Nolloth; the line which connected Cape Town with Wellington has been carried forward to Worcester. When completed, it will be a trunk line extending from one end of the colony to the other. Another line has been begun at Port Elizabeth, in order that it may pierce the gaps in the mountain regions, and open up the way to the country behind them. A line is projected from East London with a similar view. The shipping at Cape Town is now secure by a breakwater and docks. The same cannot be said of Port Elizabeth, East London, and the Kowie; but measures are being taken which, it is hoped, will result in making these also safe from the fierce south-east winds.

This splendid country is at present occupied by an assemblage of very varied races. The Portuguese were the first Europeans who landed here. The Dutch are probably still the most

numerous, notwithstanding the exodus prompted by the slave question, and the slower emigration which has peopled the Trans-Vaal. Next in number to the Dutch are the English, by whom some parts of the country, particularly in the east, are occupied almost exclusively. Of other Europeans, the French are also largely represented, many refugees having settled in it subsequently to the revocation of the Edict of Nantes. They were at first located principally in the west, where they introduced the culture of the vine, but their names are now found in almost every part of the land. There is also a considerable importation of Germans, who have been settled on the frontiers adjoining the Kaffirs for defensive purposes. As regards the coloured inhabitants, large numbers of Kaffirs have been retained in the districts which they formerly occupied, and others have come into the country as shepherds and servants. There is a large number of people of Malay origin in and around Cape Town, and in towns on the east coast, who gain a livelihood as fishermen, porters, and the more laborious sorts of skilled labour. There are a few Mozambiquees and Hottentots, besides a number of half-castes, to whom the name of Afriander properly belongs.

The constitution of the country, after several changes, was fixed in its present form, by an act passed by the colonial legislature in 1872, which provides for responsible government. There are two elective chambers, the Upper House, consisting of 21 members, 11 of whom represent the western province as one constituency, and 10 the eastern. They are presided over by the Lord Chief-justice. To the Lower House, or House of Assembly, two representatives are appointed by each division of the colony, with the exception of the Cape district, which, as being more populous, returns four. They amount in all to 64, and are presided over by a speaker of their own choice. The 16 electoral divisions into which the western and eastern provinces are each divided, are again subdivided for magisterial and fiscal purposes. The governor carries on the administration along with a ministry of 5 members—the Colonial Secretary, the Attorney-general, the Treasurer-general, the Commissioner of Crown Lands and Public Works, the Secretary for Native Affairs. The supreme court, which has its sittings in Cape Town, has two judges besides the Lord Chief-justice. Another court holds its sittings in Graham's Town, in which there are two judges only, but there lies an appeal to the supreme court. In other parts of the colony, justice is administered by the judges going on circuit. Smaller suits and misdemeanours are settled by a resident magistrate.

Wool is the staple product of the colony; ostrich farming and the culture of the vine are carried on. The following tables shew the exports and imports of the colony for four recent years:

	Exports in Tons.	In Value.
1869,	265,262	£3,139,689
1870,	182,935	2,453,768
1871,	173,002	2,408,635
1872,	228,614	4,757,494

	Imports in Tons.	In Value.
1869,	230,113	£1,963,091
1870,	186,304	2,352,043
1871,	176,625	2,585,298
1872,	245,517	4,388,728

The coasting trade has increased in a much higher proportion. The revenue shews steady increase:

	Annual Revenue.
1869,	£593,245
1870,	831,211
1871,	836,097
1872,	1,161,548

**CAPE RIVER**, properly *Vauks*, taking its popular name from the proximity of its mouth to Cape Gracias a Dios, on the east reach of the Mosquito shore in Central America. After a generally north-east course of nearly 300 miles, it enters the Caribbean Sea, about lat.  $14^{\circ} 59' N.$ , and long.  $83^{\circ} 11' W.$ , being navigable for a considerable distance upwards.

**CAPE ST VINCENT**, a headland forming the south-west extremity of Portugal, in lat.  $37^{\circ} 2' N.$ , long.  $9^{\circ} W.$ , is celebrated on account of two naval battles in which British ships were engaged, fought off it, one in 1693, the other in 1797. In the former, Admiral Rooke, who with some 20 English and Dutch men-of-war was convoying a fleet of some 400 merchantmen, was attacked off this point by the French Admiral De Tourville, and after a running fight lost several ships, and 80 merchantmen. In February 1797, Sir John Jervis, with a fleet of 15 sail, gave battle to a Spanish fleet of 27 sail of the line, and defeated them, capturing four ships and driving the rest into Cadiz Bay, where they were blockaded.

**CAPE TOWN**, the capital of Cape Colony, faces Table Bay to the north-east, is flanked by the mountain Lion's Head, with its continuation to Lion's Rump or Signal Hill, and has behind it the precipices of Table Mountain. Its latitude is  $33^{\circ} 56' S.$ , its longitude  $18^{\circ} 28' 7'' E.$  Its mean temperature  $53.3^{\circ} F.$  for winter,  $76.6^{\circ}$  for summer, and  $67.3^{\circ}$  for the whole year. Pop. 29,000. Two lines of passenger wagons connect it with the diamond fields, which are reached in about a week, a railway with Wellington, and electric telegraphs with the principal parts of the colony. It is the principal port for the coasting trade as well as foreign exports and imports; is well supplied with fish, as well as meat, dairy produce, and every sort of fruit and vegetables, at a moderate price. It has a supply of fresh water of excellent quality. C. T. is the seat of the government, the supreme court, and a college and university. All the churches are well represented—the English Episcopal, the Roman Catholic, and representatives of Presbyterians, Lutherans, Wesleyans, Congregationalists, a Free Church (chiefly an off-break from the Dutch Church), a Jewish synagogue, and a Mohammedan mosque, the Malay population being of that faith. There are also banks and insurance offices. The town is built upon a double slope, which subsides into a plain on the north-east side. Its streets, at right angles to each other, are lined with houses, for the most part of an Eastern type, with heavy walls, flat roofs, and large public apartments, interspersed with increasing numbers of shops and warehouses, of the sort to be met with in England.

The most remarkable structures are the break-water, with the docks and patent slip; the castle, with its outworks and bastions; the barracks for the military, the Roman Catholic Cathedral, with a few other places of worship; the museum and library, with the Botanic Gardens in front; and between it and Government House, a park, with its avenues shaded by stately oaks. Out of town, a little distance to the north-west, is Somerset Hospital, and the Royal Observatory, about two and a half miles to the north-east.

C. T. returns four members to the colonial assembly. The municipality is administered by a town-council of 18 members—three from each of six separate districts—and is presided over by a mayor elected annually by the council. In September 1872, it possessed 44 vessels, and their united tonnage was 4416. There are 5 newspapers in C. T., which are issued three times a week; 2 bi-week-

lies, 1 weekly, 1 fortnightly, and 3 monthly magazines.

**CAPE VERD**, the most westerly headland in Africa, jutting out into the Atlantic Ocean, between the rivers Gambia and Senegal, in lat.  $14^{\circ} 43' N.$ , long.  $17^{\circ} 34' W.$ . It was discovered by the Portuguese about 1445, and is said to have derived its name from a group of gigantic baobab-trees which adorns its summit.

**CAPE VERD ISLANDS** (*Ilhas Verdes*), a group of islands belonging to Portugal, lying in lat.  $14^{\circ} 45'$ — $17^{\circ} 19' N.$ , and long.  $22^{\circ} 45'$ — $25^{\circ} 25' W.$ , and distant about 320 miles west of the cape from which they take their name. The principal islands are ten—viz., Santiago, the largest and most important, Fogo, Brava, Maio, Boavista, San Nicolao, San Antonio, San Vicente, San Luzia, and Sal. There are besides four islets, barren and uninhabited. The total area is about 1700 square miles, with a population (1869) of 70,000. The islands are all very mountainous, and owe their origin to the action of submarine volcanoes. The highest elevation is reached in a volcanic peak, 915 feet above the sea, on the island of Fogo, and which is still active. The climate is unhealthy during the rainy season. Though water is deficient, vegetation is luxuriant, yielding African and Southern European products. Sugar, cotton, coffee, tobacco, and indigo are grown, and the trade in archil, monopolised by government, has in some seasons yielded as much as £24,000. Several of the European domestic animals thrive well. Turtles are abundant in the surrounding seas, and whales also are fished by British and American vessels. Amber is found on the coasts, and great quantities of salt formed by solar evaporation is obtained from the lagunes on the shores, especially on the island of Sal. The inhabitants, who are mostly negroes, indolent but harmless, speak a corrupted form of Portuguese, called Lingua Creoula. The revenue for 1857—1858 was estimated at about £24,000, and the expenditure for the same year at £31,000. The islands are under a governor-general, exercising both civil and military authority. The chief ports are Porto Praya, on the island of Santiago, and Porto Grande, the best harbour in the whole group, on the island of San Vicente. The islands were discovered about the middle of the 15th c. by the Portuguese, who shortly after colonised them.

**CAPE WRATH**, a pyramidal promontory of unrivalled wildness and grandeur, forming the north-west extremity of Scotland and of Sutherland, and running out into the Atlantic, in lat.  $58^{\circ} 38' N.$ , and long.  $4^{\circ} 58' 5'' W.$  It consists of gneiss, with beds of dark hornblende rock, is intersected by complex granite veins, and presents deep fissures and tall pinnacles. From it a reef of rocks, perforated with arches and caverns, juts out into the sea. Off the cape is Stag Rock, a pillar 200 feet high. C. W. is 600 feet high, and there is a light-house near it, 400 feet above the sea, and seen 25 miles off. From the Cape can be seen N. Rona, 50 miles off; Hoy Head, Orkney; the Butt of Lewis; and a grand panorama of mountains in Sutherland.

**CAPEFIGUE**, BAPTISTE HONORÉ RAYMOND, a French publicist and historian, was born, 1802, at Marseille. He studied law at Aix, and in 1821 proceeded to Paris, for the purpose of completing his juridical course, but soon betook himself to journalism and authorship. He held a post in the foreign office until 1848. This, however, did not interfere with his amazing activity. Besides contributing extensively to many of the Parisian journals, he has 'manufactured' not less than a hundred volumes of history—not indeed, intrinsically

## CAPELIN—CAPPERS.

valuable, but indicating wonderful facility in the use of the pen. The best is the *Histoire de la Restauration* (3d edit. 1842). He has published of late years many interesting biographical works.

**CAPELIN** (*Mallotus Greenlandicus*), a small fish of the family of *Salmonidae*, extremely abundant on the coasts of Newfoundland, and much used as bait in the cod-fishery. It is also, in a dried state, an article of commerce, and is imported, although not very largely, into Britain, where it sometimes appears on the breakfast or supper table. Its flavour, which is very agreeable, suggests to most persons the idea of its belonging to the herring rather than the salmon family. It is nearly allied to the smelt, but the teeth are smaller and more numerous. It is the only known species of its genus.—Shoals of capelins arrive periodically on the coast of Newfoundland, the vast numbers changing the very colour of the sea.

**CAPELLA**, a bright star of the first magnitude, on the left shoulder of Auriga. C. is also called Capra or the *She-goat*, a name also sometimes given to Capricorn.—The poets fable C. to be Amalthea's goat, which suckled Jupiter in his infancy.

**CAPELLA.** See A CAPELLA.

**CAPELLA, MARTIANUS MINEUS FELIX**, a learned author belonging to the second half of the 5th c., was born in Africa, but where is not definitely ascertained. Of his life nothing whatever is known. The work which has preserved his name to posterity is the *Satyricon*, a kind of encyclopaedia, highly esteemed during the middle ages as a work of reference. It is written in a medley of prose and verse, and is full of curious learning, but possesses no literary value; the style has all the bombastic pomp of the African school of later Latinists. It consists of nine books. The first two consist of an allegory, *The Nuptials of Philology and Mercury*, while the remaining seven are devoted to the 'liberal arts,' grammar, dialectics, rhetoric, geometry, arithmetic, astronomy, and music. The first edition of the *Satyricon* appeared in 1499, under the care of Franciscus Bodianus; the best in 1836, under the care of U. F. Kopp.

The book on astronomy is remarkable as containing a hint of the true theory of the solar system. Mercury and Venus are there declared to move round the sun, and not round the earth; and their relation to these bodies is properly explained. Now as Copernicus knew C., and quotes from him, it is not unlikely that he derived the first idea of his doctrine from this writer.

**CAPERCAILZIE, CAPERCAILLIE, WOOD-GROUSE, or COCK OF THE WOODS** (*Tetrao Urogallus*), the largest of the gallinaceous birds of Europe. It is a species of Grouse (q. v.), almost equal in size to the turkey; the male, which is the largest, sometimes weighing fifteen pounds or more. In figure and appearance, it much resembles the black-cock, but the tail of the male C. is rounded, and not forked, as in that species; and the male C. has the feathers of the head elongated. The general colour of the adult male is brownish black, minutely freckled with grayish white, and with lighter brown; the quill-feathers dark brown; the tail-feathers nearly black, some of the longer tail-coverts on the sides of the tail tipped with white; the chest is of a shining dark green; there is a small scarlet patch of naked skin above the eye, and the bill is whitish. The general colour of the female and of young males is dark brown, freckled with yellowish brown; the front of the neck and the chest are yellowish chestnut; and the feathers of the under parts are generally edged with white. The C. has the feet feathered to the toes, but the toes

are naked. It is an inhabitant of pine-woods; feeds on berries, seeds, worms, insects, &c., and on the young shoots of the pine, greatly preferring the Scotch fir to the spruce; occasionally also eating, at least in winter, the buds of the birch and other

Capercaillie.

trees. The female makes her nest on the ground, and lays from six to twelve eggs, of a pale reddish or yellowish brown, spotted with other shades of brown, and more than two inches long. Like the black-cock, the C. is polygamous.—The geographical distribution of the C. is very extensive: it is found on the pine-covered mountains of all parts of Europe, from Spain and Italy almost to the North Cape, and is abundant in the northern parts of Asia. It was at one time found both in Scotland and Ireland, but was completely extirpated about the end of the 18th or beginning of the 19th century. Through the exertions, however, of the Earl of Fife and other proprietors of great Highland estates, but particularly of the Marquis of Breadalbane, it has again been restored to the forests of the Highlands of Scotland. The C. is very capable of domestication, and breeds readily, if allowed the range of a space containing a few pine-trees. It is much esteemed for the table. The market of Stockholm is well supplied with it in winter; and since the establishment of steam communication, it has been regularly brought from Scandinavia to London.

**CAPERNAÜM**, meaning 'the field of repentance,' or 'city of comfort,' was in the time of our Saviour a favourite and exalted city, and one of the three which he upbraided 'because they repented not.' It was situated on the north-western coast of the Sea of Galilee, or Lake of Gennesareth. It is now a heap of ruins, extending more than a mile along the shore and back towards the mountains, so overgrown with grass and bushes, that it is difficult to move among them. C. is called by the natives of Syria Tell-hun.

**CAPPERS** are the pickled flower-buds of the caper-bush (*Capparis spinosa*). They have an agreeable pungency of taste, with a slight bitterness, and have long been in very general use as a condiment and ingredient of sauces, along with boiled mutton and other kinds of food. They possess medicinal properties, being antiscorbutic, stimulant, and laxative. They are of a grayish green colour, to improve which, however, copper is sometimes used, as in the case of gherkins and other pickles, rendering them poisonous. This can be detected by thrusting a polished iron rod into the vessel which contains the C.; the surface of the rod soon becoming coated with copper, if it is present.—The caper-bush is a native of the south of

## CAPERS—CAPETIAN DYNASTY.

Europe, and other countries near the Mediterranean. It is extensively cultivated in some parts of the south of France and in Italy, but most of all in Sicily. It succeeds in the open air even at Paris, but in Britain requires the aid of artificial heat. It is a trailing, rambling shrub, loving dry places, and often growing on rocks or walls, adding a fresh charm of beauty to many an ancient ruin. It begins to flower early in summer, and continues flowering till winter. The buds are gathered every morning, and are immediately put into vinegar and salt: at the end of the season, they are sorted according to their size and colour, the greenest and least expanded being the best, and are again put into vinegar, the finest being sent to the market in

Caper (*Capparis spinosa*). bottles, the coarser in small barrels. The fruit,

which is a small berry, is also pickled in the south of Italy. The flower-buds of the caper of Mount Sinai (*Capparis Sinica*) are pickled like those of the common species; the seeds are also pickled, and are called by a name signifying Mountain Pepper. The fruit of *Capparis aphylla* is made into a pickle in India. Species of *Capparis* are numerous in India, the warm parts of America, &c. See CAPPARIDÆ.—Various substitutes for C. are sometimes used, as the flower-buds of the Marsh Marigold (*Caltha palustris*), those of the Indian Cress (*Tropaeolum majus*), and those of the Bean Caper (*Zygophyllum Fabago*).

CAPETIAN DYNASTY, the third Frankish dynasty, founded about the close of the 10th c., when Hugo Capet ascended the throne. The surname CAPET has been derived from *cappetus*, 'a monk's hood,' because, though duke of France, Hugo was also abbot of St Martin de Tours. On the death of the last Carlovingian monarch (Louis V., surnamed *Le Fainéant*—i.e., the Slothful), Hugo, the most powerful of French vassals, seized the throne, and by moderation and prudent concessions made to the authorities of the church, as well as to his brother-nobles, who had made themselves independent, contrived to retain the power he had seized. He was crowned at Noyon, July 3, 987. In order to establish his dynasty, Hugo caused his eldest son Robert to be crowned as co-regent, 988. Capet first made Paris the capital of France. He died in 996; when his son Robert, a well-disposed but feeble ruler, ascended the throne, who died 1031, beloved by his domestics, but despised by his neighbours and vassals, forgotten by his people, and permitting all power to vanish from his hands. It was during his long lethargic reign that the towns and cities of France began to form themselves into corporations, to act in their own name, to contract obligations, and lay the foundations of middle-class freedom. In many other ways, also, the happy dissolution of royal power sowed the seeds of national prosperity. Robert's sons were Henry, who succeeded him, and Robert, ancestor of the older House of Burgundy.

Henry left two sons—Philippe I., who ascended the throne, and Hugo, who distinguished himself in the first crusade (1096), and died 1102. Philippe,

under the regency of Baldwin, Count of Flanders, came to the throne when only eight years old, and first really began to reign after the death of the regent (1066). He took hardly any part in the great movements and events of his times, but supported Robert, son of William the Conqueror, in his rebellion against his father. Consequently, William commenced an expedition against Paris, and would probably have dethroned Philippe, but died in 1089. By his dissolute course of life, Philippe fell under a sentence of excommunication issued by Pope Gregory VII. in 1094, and, after doing penance, died in 1108.

His successor, Louis VI., surnamed *Le Gros*, had, during Philippe's lifetime, been active in the support of the crown, and now extended the royal power which had been almost entirely confined within the duchy of Paris. By bold and vigorous measures he brought everywhere his vassals into real subjection to his authority, liberated the towns from baronial oppression, partly abolished feudal bondage, and extended considerably the jurisdiction of the crown. His life was an almost incessant contest with the small and turbulent vassals who had rioted in the license afforded them by the weakness of his predecessors. He died 1137, leaving a numerous family.

As his eldest son and co-regent, Philippe, had died during the reign of Louis, his second son, Louis VII., *le Jeune*, now came to the throne, and by his marriage with Eleanor of Guienne, heiress of the Duke of Aquitaine, gained a considerable accession to the power of the crown. He engaged in the second crusade, and led 100,000 men to the East; but was unsuccessful, and returned to France after an absence of two years. In 1152 he divorced his unfaithful wife Eleanor, who subsequently married Henry Plantagenet, afterwards Henry II. of England. This marriage made Henry far more powerful than the king of France, and Louis would probably have lost his crown had not the disturbances in England—the quarrels with Becket and with his own sons—proved sufficient to occupy Henry's attention. Louis *le Jeune* died 1180.

Philippe Auguste (q. v.), his son by a third marriage, ascended the throne ten months before his father's death, and proved himself the most able ruler of the Capetian dynasty. Against the wishes of his family, he married Isabelle of Hainault, great-granddaughter of the last of the Carlovingians, and thus finally united the two houses. His successor, Louis VIII., who died 1226, was said to have been poisoned by the Count of Champagne, paramour of the queen, Blanca of Castile. Louis VIII. was followed by his son Louis IX. (SAINT LOUIS, q. v.), who died at Tunis, 1270. Of the eleven children of St Louis, the eldest, Louis, died aged 16 years, while the youngest, Robert, became the founder of the Bourbon dynasty (see BOURBON). The second son, Philippe III., *le Hardi*, succeeded his father, and, by the decease of two brothers and two uncles, acquired possession of Poitou, Auvergne, and Toulouse. His son (Philippe IV., *le Bel*) acquired by marriage Champagne with Navarre. These acquisitions, and his attempt to secure for his uncle, Charles of Anjou, the throne of Naples, involved Philippe III. in contentions with Italy and Spain. He subjugated Navarre, 1276, and died of the plague in 1285. Philippe IV., *le Bel*, succeeded to the throne when seventeen years old. He soon gave signs of a despotic character, plundered the estates of the church, defied papal authority, persecuted the order of Templars (q. v.), and removed the residence of the pope to Avignon. The atrocious act of burning the grand-master, with sixty knights, of the order of Templars, after they had recalled all

## CAPIAS—CAPILLARY ACTION.

the confessions drawn from them by torture, has left an ineffaceable blot on the name of Philippe le Bel. He died 1314, and left three sons and a daughter.

The eldest son, Louis X., *le Hutin*, who ascended the throne, displayed remarkable weakness of character, and died 1316. He was succeeded by Philippe V., *le Long*, second son of Philippe le Bel, who died without issue. By his death (1322) the crown came to Charles IV., *le Bel*, third son of Philippe le Bel, and the last of the direct line of the Capetian kings. He died 1328, leaving by his third marriage a daughter, named Blanche, who married Philippe, Duke of Orleans, and died (1392) leaving no issue. Isabelle (daughter of Philippe le Bel) married Edward II. of England, and was mother of Edward III., who consequently took the title of king of France, which was retained by the kings of England until the reign of George III.; but Philippe of Valois, cousin of the last Capetian king, and grandson of Philippe III., *le Hardi*, claimed the crown of France by virtue of the Salic law, and so founded the dynasty of Valois (q. v.).

**CAPIAS**, in the practice of the English common law, is a writ directed against the person, and so called from the commencement of the process in the old Latin form. It has various applications, the principal of which are the following :

**CAPIAS AD RESPONDENDUM** is a writ which a plaintiff, after action, may sue out upon affidavit against a defendant who, there is reason to believe, is about to quit England, and against whom there is a cause of action to the amount of £50 or upwards, whether as matter of contract or of damage. The writ directs the sheriff to arrest the defendant, who remains in custody on such arrest until he shall have either given a bail-bond with reasonable sureties. This arrest is only when the defendant's absence will prejudice plaintiff.

**CAPIAS AD SATISFACTIONDUM, or CA. SA.** This is one of the writs by which a plaintiff can put a judgment recovered by him in execution. The object of it is to imprison the debtor till satisfaction, when imprisonment is still permitted. See on the subject of Capias generally, APPREHEND, ARREST, ATTACHMENT, EXECUTION, and BAIL.

**CAPILLAIRE**, a medicinal syrup, used as a pectoral in chronic catarrhs, is prepared by adding sugar and orange-flower water to an infusion of the fern called MAIDENHAIR (q. v.), or by pouring boiling syrup on the fern.

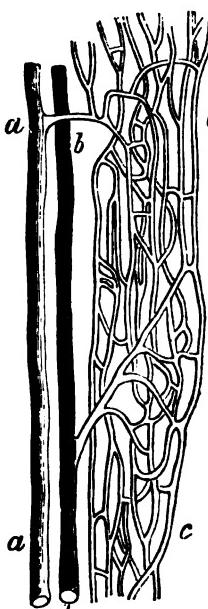

**CAPILLARIES.** The tubes which convey the blood from the left side of the heart to the various parts of the body are termed arteries, while those which return it to the right side of the heart, after it has discharged its various functions in the body, are known as veins. The name of capillary (from *capilla*, a hair) is given to the minute vessels which form the connection between the

terminal branches of the arteries and the commencements of the trunks of the veins. These little vessels are of various sizes, some admitting only one blood-corpuscle at once, while others are large enough to allow of the simultaneous passage of two, three, or more corpuscles. In the muscular tissue their average diameter is 0.003 of a line; they are smallest in the brain, and largest in bone. Their arrangement varies in different parts. In the accompanying figure, which represents their distribution in muscular tissue, they run for the most part parallel to one another; in other cases (as around fat-cells) they have a spherical arrangement, and in the skin and in parts of the intestines they form loops; and many other forms of distribution might be mentioned. These various arrangements have been discovered by the microscopic examination of tissues that have been successfully injected with coloured fluids.

The circulation of the blood through the C. may be readily seen in the web between the toes of the hind-foot of the frog, in the tongue of that animal, in the tail or gills of the tadpole, in the wing of the bat, &c.

The principal uses of the capillary system of vessels will be noticed in the articles on DIGESTION, NUTRITION, RESPIRATION, and SECRETION.

**CAPILLARY ACTION.** When a clean glass tube with a fine bore, open at both ends, is plunged into a liquid capable of wetting it, such as water, the liquid is found (1) to rise in the tube above the level of its surface in the vessel containing it; (2) to rise the higher in the tube above that level the finer its bore is; (3) to stand above the general level in the tube where it approaches the sides (as in fig. 1, which is drawn on a greatly exaggerated scale), so that its upper surface in the tube is curved and concave. When a similar tube is plunged into a liquid incapable of wetting it, such as mercury, phenomena of a precisely opposite nature are presented. The liquid stands in the tube below the level of its surface in the vessel; and where it

Capillaries :  
a, the artery; b, the vein;  
c, the intervening capillaries.

lary (from *capilla*, a hair) is given to the minute vessels which form the connection between the

Fig. 1.

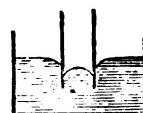

Fig. 2.

approaches the sides of the tube, it stands below its general level in the tube, so that its upper surface is curved and convex as in fig. 2, the convexity and depression in the tube increasing with the fineness of its bore. While such is the case with the two classes of liquids described, there are others on which fine tubes have no action, so that they stand in such tubes at the same level as in the vessel, and with plane upper surfaces. These are the leading phenomena to be explained by what is called C. A., the tubes with fine hair-like bores being called capillary tubes, from Lat.

*capillus*, a hair. The phenomena, however, though connected by name with such tubes, are not dependent on them, but may be produced without their intervention by any contrivance which gives room for the so-called capillary action. For instance, if two plates of glass with parallel faces be placed

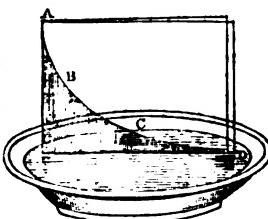

Fig. 3.

## CAPILLARY ACTION.

together with two of their edges in contact, and the two opposite be separated a very little by a fine wedge; and then if they be put standing with their common edge vertical in a trough (fig. 3), containing a little coloured fluid capable of wetting the glass, the fluid will rise between the plates, the height attained at any point being inversely as the distance between the plates at that point, so that its upper surface will be a curve of the kind known as the hyperbola—being highest near the common edge, and lowest near the edges separated by the wedge. If the same apparatus be placed in a trough containing mercury, the mercury will be depressed between the plates till its upper surface forms a hyperbola convex to the zenith.

To understand the peculiar action producing these phenomena, it must be kept in view that the surface of a fluid at rest under gravity is a horizontal plane (see HYDROSTATICS), and that this plane is maintained by gravity and the mutual attractions of the particles of the fluid mass. Suppose now a fluid at rest in a vessel to have a foreign body, such as a capillary tube, suddenly plunged into it, and separating, as by walls, a portion of the fluid from

the rest. By cohesion (q. v.), the fluid particles inside the tube will be held on—drawn downwards—to the mass of the fluid, while by adhesion (q. v.) they will be drawn upwards towards the sides of the tube. By the ordinary action of gravity, as in tubes of a large size, the fluid will at once tend to rise in the tube to its level in the vessel. Whether it will succeed in doing so, or whether it will rise still higher, must

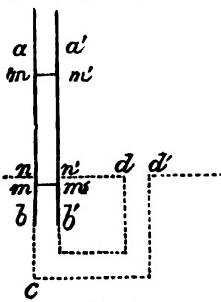

Fig. 4.

depend on the adjustment of the forces of cohesion between the fluid particles and their adhesion to the solid of the tube. The relation of these forces may be generally explained as follows: Let  $mm'$  (fig. 4) be the surface of the column,  $mn$ , of a liquid contained in a space,  $ab/a'$ , above or below the surface,  $nn'$ , of the external liquid. There being equilibrium between the liquid in the tube and in the vessel, any line of liquid particles may be taken and supposed to be detached from the rest and enclosed in a tube, without altering the forces exerted. Let the line included between the dotted lines be conceived so detached. The actions which the particles of the liquid in the tube exert on each other, or sustain from the sides of the tube, have no tendency to make the liquid move either up or down. But the column,  $mb$ , in the tube has some action exerted on it by the sides of the tube above the surface,  $mm'$ . Let  $A$ , depending on the force of adhesion, represent this upward action of the tube. The column is also attracted downwards by the detached column  $bc$ , i. e., by the liquid in the imaginary tube. Let  $C$ , depending on the force of cohesion, represent this downward action of the liquid. Also the part  $bc$  of the liquid is attracted upwards by the tube  $ab$  by the attraction which we have represented by  $A$ . Thus the liquid column is acted on by two upward actions =  $2A$ , and a downward action,  $C$ . The whole force acting on it, excluding gravity, is  $2A - C$ . Gravity would make the liquid rise to  $nn'$  at once, i. e., till it stood as high in the tube as in the vessel. Whether, then, it will rise above  $nn'$ , or be depressed below it, must depend on whether  $2A$  is greater than  $C$ , equal to it, or less than it. If  $2A = C$ , the liquid will stand in the

tube at the level  $nn'$ , as if these forces did not act at all. If  $2A > C$ , then  $2A - C$  will be an upward force, and the column will be raised above the level  $nn'$ . If  $2A < C$ , then  $2A - C$  will be a downward force, and the column be depressed.

Regarding the forms of the upper surfaces of columns of liquid in capillary tubes, it can be demonstrated mathematically that the same relations of the forces of attraction and cohesion, which determine the elevation or depression of the liquid column, determine also the form of its upper surface in the two cases of elevation and depression. In fact, the case of the elevated column resembles that of a cylinder of any very elastic substance (so elastic as to suffer change of form very readily under pressure), supported wholly by the rim at one of its ends; or, what is the same thing, by vertical forces acting in the lines composing its outer surface. Gravity draws down the concentric shells, of which the cylinder may be conceived to be composed, the further the more remote they are from the outermost, or that which is directly supported, the central rod being the most depressed. It would appear that the form of the surface has an important bearing on the cause of the production of the whole phenomena.

The third fact of observation—viz., that the liquid rises higher or is more depressed the finer the bore of the tube—is thus explained in the case of elevation: Since the action of adhesion is confined to the superficial layer of the fluid, and between the same substances is, *ceteris paribus*, constant in quantity for an equal extent of surface, the wider the tube the shorter must be the column sustained, as the contents of the column raised by cohesion increase more rapidly when the bore increases than the attracting surface. The column increases with the square of the diameter of the tube, while the attracting surface increases only with the diameter. The height, therefore, is inversely as the breadth of the tube. That the depression must increase as the bore of the tube diminishes, appears from reasoning similar to that employed in the case just discussed.

The degree of elevation varies with the nature of the fluid, the variation depending partly on the difference of cohesion between the particles of the fluid, and partly on the difference of adhesion between the fluid and glass. It is found that temperature affects these forces, so that the height diminishes as the temperature rises.

The depression of mercury in a fine glass tube makes it necessary to use a correction in reading off the height of the mercurial column in the barometer, which, owing to it, stands always a little lower than the height due to the atmospheric pressure. Experience, however, has shewn that the capillary depression is nearly one-half less in tubes which have had the mercury boiled within them than in unboiled tubes, as by the boiling a film of air, which in unboiled tubes adheres to the glass, is expelled. By widening the bore of the tube also, the error may be diminished so as to be neglected altogether. In a tube of  $\frac{1}{4}$  inch in diameter, in which the mercury has been boiled, the depression is 0.02 inch, while with a similar tube of  $\frac{1}{2}$  inch diameter it is only 0.003. The depression of mercury, it is found, is slightly increased by an elevation of temperature. It may be mentioned that in reading off the level of mercury in any instrument, such as the barometer, the height should be taken from the convexity of the curve. If the liquid used in the instrument, however, wets the tube, the height should be taken from the concavity.

As already stated, the phenomena are not dependent on the intervention of tubes; any capillary

cavity suffices to produce them. When two light bodies, such as two bits of cork, are left to float on water, near each other, they soon come together, moving at last with a rush. This is sometimes given as an example of the gravitation that draws the planets to the sun; but it is really owing to this capillary action that we are considering. When the liquid wets the floating bodies, it rises slightly all round them, and this sustained liquid hangs as a weight on them on all sides. So long as it rises equally, there is no motion; but when the bodies come near each other, the space between them becomes like part of the inside of a capillary tube, the water rises higher there than on the other sides, and the bodies move towards the sides that are most strongly pulled. When the floating bodies are not wetted by the liquid, the surface between the two bodies is depressed, as that of mercury is inside a glass tube, and the bodies descend, as it were, down the opposing slopes, and meet in the bottom of the hollow. If one of two bodies floating on water is smeared with oil so as to prevent the water from adhering, instead of coming together, the two will recede from each other, for reasons analogous to the above.

C. A. plays a most important part in nature in a great variety of ways. An instance of its employment by man is seen in the wicks of lamps and candles, which, being composed of fibrous materials, furnish hair-like channels by which the melted oil is elevated to the flame, and supplied as fast as it is consumed. C. A. influences the circulation of fluids in the porous tissues of animals, and it is the principal mode in which water, with the various substances which it holds in solution, is supplied to the roots of growing plants. It is through it that in summer droughts moisture is raised to the surface for the maintenance of vegetable life. C. A., too, affects many phenomena usually considered under the head DRYEVON (q. v.) of fluids and gases. The reader, on referring to the article OSMOTIC ACTION, will also see that it enters into the explanation of the phenomena known as exosmose and endosmose.

A familiar illustration of C. A. is furnished when one end of a towel happens to be left in a basin of water, while the other hangs over the side below the level of the water; the basin is soon emptied of its contents. It is important to observe that, although the towel will become wet, not a drop will flow from it, unless the outside end reach below the level of the water in the basin. In this respect C. A. resembles that of the syphon. And this shews the error of supposing that water may rise through the earth by C. A., and flow out as springs at a higher level than the source whence it is drawn.

Some very interesting experiments have been made by M. Poisenille (*Ann. de Chimie et de Phys.* III. xxi. 76) concerning the flow of liquids through capillary tubes, the results of which must here be stated. It appears that when the tube exceeds a certain length—which is greater as the bore increases—the following laws regulate the rate of efflux of the liquid, the efflux taking place under pressure: 1. The flow increases directly as the pressure, so that under double the pressure, double the amount is discharged in equal times. 2. In tubes of equal diameter, the quantities discharged vary inversely as the length of the tube. If a tube 2 inches long discharge 100 grains in 5 minutes, a tube 4 inches long will only discharge 50 grains. 3. In tubes of equal lengths, but different diameters, the flow is as the fourth power of the diameters. If one be  $\frac{1}{4}$  of an inch in bore, and the other  $\frac{1}{16}$ , the efflux from the larger will be 16 times as great

as from the smaller. It is further found that the efflux varies with the nature of the liquid, the material of the tube not appearing to affect the result in any great degree. No law of the rate of efflux has yet been discovered, depending on the density, capillarity, or fluidity of the fluids.

It may be mentioned, in conclusion, that the tubes to be used in the experiments on capillarity should be perfectly clean and dry. If wetted, the film of moisture on the tube forms a new tube, and the action will be the same as with a tube of the substance forming the film. The reader should consult Miller's *Elements of Chemistry*, and J. Clerk Maxwell's *Theory of Heat*, where the phenomena are treated from a different point of view; the phrases 'superficial energy' and 'superficial tension' being substituted for 'capillarity,' and the hypothesis of molecular attraction being avoided.

CAPITA, DISTRIBUTION PER—i. e., distribution by heads, or by numbers, equally—occurs in the case of several claimants to the property of a deceased person, all severally claiming in their own right, in equal degree of kindred, and not under any right of representation. See INHERITANCE, SUCCESSION.

CAPITAL (Lat. *capitulum*, from *caput*, the head), the head of a column, pilaster, &c. Till the period of the renaissance, the head of a column in English was called chapter (chapter), its diminutive being chapitrell. See COLUMN.

CAPITAL, in Fortification, is an imaginary line dividing a defence-work into two similar and equal parts. The C. of a bastion is a right line drawn from the point or salient angle to the middle of the gorge or entrance in the rear. The C. of a ravelin is a right line drawn from the re-entering angle of the counterscarp to the salient angle of the ravelin. See the wood-cut in CAPONNIER.

CAPITAL, in Geography, the principal city or town of a country, that in which the sovereign usually resides, and where the legislature meets, and the chief legal courts are held.

CAPITAL, in Trade and Political Economy, is in its restricted sense applied to the money, or the property convertible into money, with which a trader or producer carries on his business. In this sense, Adam Smith and many other writers call it stock; and there is a convenience in having a separate term for expressing this sense of the word C., since it is totally different from its wider sense as an element in political economy. Many attempts have been made to define C. in its general sense, but with very imperfect success, since no sooner is a restrictive definition laid down, than some one can point at things which are C., and yet are not included in the definition. It has, for instance, been called the produce of past labour stored up and applied to the facilitating of future labour; but, as we shall see, many things become C. which the hand of man has never touched. There is no doubt, however, that the existence of C. arises out of the fact of labour or industry having been exercised; and perhaps a good general understanding of its character may be derived from treating it as the *impulse* or *impetus* which past industry gives to facilitate future industry. Wherever something is reserved from immediate consumption, and made to serve in future production, there is capital. We cannot have a better illustration than in the first bow and arrow made by the savage. He has expended on this machine for securing his food a portion of the time and labour which he might have given to the tedious task of catching his food with his own hands, and at

## CAPITAL—CAPITAL ACCOUNT.

this sacrifice he has obtained the means of more easily and economically obtaining it in future. All C. is not, however, *directly* made by the industry of the owner, or, indeed, by industry at all. The accidental finder of a diamond, or a pearl, worth £100, possesses so much capital. His acquisition, however, would have no value but for those productions of industry which it is permitted to represent, and if pearls and diamonds were often found, they would cease to be valuable; the trade of finding them is as laborious and as ill remunerated in the long-run as most others. The owner of a barren heath, which was intrinsically worth nothing, finds it become suddenly valuable by the progress of a large town; but it is the industry of that town which has given the value, and the owner having the good-fortune to have a hold on a portion of the produce of that industry, becomes a capitalist. It is impossible to enumerate all the elements of which C. in the general sense consists, or all the ways in which it can be made. Whatever thing done enables some other thing to be done which supplies any of the necessities or wishes of the human race becomes capital. Thus, the education and skill of the barrister, the physician, and the artist—the agility, acquired through long and toilsome practice, of the rope-dancer and the juggler—all are capital. It makes C. to shift the place of a thing, bringing it from where it is not, to where it is, wanted. So, also, the changing of a person's place may become C. to him, as where he leaves a district in which his trade is not required, or exceeds the demand, for one where he can pursue it to advantage. Successful emigration thus creates C., bringing into human use districts of land which previously lay useless. The total C. at any time in existence consists of an aggregate of the several capitals at the command of individuals or communities. But it is essential to any unit of C. that it should be sufficient for the purpose it is intended for, otherwise it may seem to be, but will not in reality be, a part of the general aggregate—it will, in fact, be lost. If an expenditure of £1000 be necessary to raise a sunk ship, and only £900 are expended, that sum which might have been available for some other purpose is lost. C., as distinguished from property or wealth, is a *moving force*; and if it be not sufficiently strong for accomplishing its purpose, it is lost. This is one of the most important truths in all political economy, since most of the great losses suffered by communities and individuals arise from undertakings for which they have not adequate C., or for which that which seems to be C. does not really turn out to be so. Perhaps the most memorable mistake of this kind ever made was when the French revolutionary government issued assignats (q. v.). These were ostensibly issued on a good security—namely, the security of the forfeited land. But however valuable that land might be in the long-run, it was not available to pay the assignats; there was no purchaser for it; and the assignate consequently fell in value. Gold to a far less amount than the money value of the land—that is to say, than the price which would be paid for it when sold in the natural course of things—would have been a sufficient C. for the issue of these assignats. The same mistake is often exhibited on a small scale when a landed proprietor keeps together a large estate which he cannot afford to improve and cultivate properly. It loses its power of C. in his hands; and he would be much better off if he sold a portion of it for money to be invested in improvements on the remainder. Probably 19 out of every 20 bankruptcies arise from the bankrupts having undertaken enterprises beyond the reach of their C.—

from over-trading, or over-speculating, as it is otherwise called. When speculation becomes epidemic, the whole community suffers from undertakings too great for its C., and a crisis occurs. Such was the great railway crisis of 1847. Parliament had, in the previous year, passed bills for the construction of railways, which, if they had all been made, would have cost upwards of £130,000,000—a sum which the country, rich as it was, could not afford to advance. Though it is an axiom that people cannot trade beyond their C., yet what can be accomplished by any given amount of C. must depend on the skill and sagacity of the person employing it. Competition no doubt tends to equalise profits, but competition is itself a contest in which each tries to drive a more profitable trade than his neighbours, and some are more successful than others. A frequent element of success is the rapid circulation of C., by which it is made to return many profits, though perhaps small ones, in the course of the year. The trader who turns over his C. ten times at a profit of 3 per cent., makes more than he who draws a single profit of 10.

If the nature of C., as the produce of past, and the promoter of future industry, were better understood by the working-classes, they would be saved from much unhappiness and mischief. Whatever C. may be to the rich man, it is bread itself to the working family. The withdrawal of the C. embarked in the cotton trade alone would starve millions; and yet many educated men have endeavoured to teach working-people that C. is their natural enemy. Its strength may no doubt be sometimes used for evil purposes, but none save evil results can arise from destroying it. The only way in which any man can effectually protect himself from such mischief as he supposes it may do, is to save, and become a participant in it. Itself the result of industry, it is a more powerful instrument in the hands of him who has made it than in any other's. The savings of working-men are the best laid out C. in the world. The first pound laid out is the most profitable of all—it represents freedom from debt, and the capacity of its owner to purchase what he wants with ready money—a privilege probably bringing him a profit of many pounds, or many hundreds per cent. upon his capital.

**CAPITAL ACCOUNT**; such is the name given to what concerns the capital stock of a railway or other public company. In authorising a railway company—which we take as an example—parliament gives power to raise so much money by shares, and so much by borrowing. The amount that may be borrowed is equal to a third of the share stock, but it cannot be legally borrowed until at least one-half of the share stock has been paid up. The form of borrowing is that of giving a mortgage on the whole property of the railway; the deed of mortgage, which is called a debenture, expresses the sum lent, the rate of interest that is to be paid, and the period for which the loan is given. See DEBENTURE. Unitedly, the money got for shares and by debentures forms the capital of the company; and, deposited in a bank, constitutes the *Capital Account*. On this fund the directors of the company make draughts to pay for the land, and all the works connected with the line, as also rails, locomotives, carriages, and, in short, everything involved in perfecting the railway up to the point of working. From the first, the holders of debentures receive interest, which must be paid in all circumstances, and the principal must be returned at the conclusion of the period for which it has been borrowed; at least, such are the ordinary obligations towards debenture holders. For the share part of the capital no return is made till the

## CAPITAL FELONIES—CAPITAL PUNISHMENT.

railway has been in operation, and drawings come in from the traffic.

As soon as traffic commences, there begins a new account called the *Revenue Account*, and which, kept in the same or a different bank, has no connection with the Capital Account. This, it may be judged, at once introduces a great complexity into the financial affairs of railways. In ordinary businesses, the profits of a concern are the free proceeds after deducting interest on capital and all expenses; and no attempt is made to keep two accounts, or to detach one part of the revenue from the other. As shareholders in a railway occupy the position of partners in a business, it might be expected that they would receive a divisible part of the proceeds equal to their respective claims after all expenses whatsoever had been paid. This is not the plan usually adopted. In general, the shareholders are only temporary partners; they buy shares in order to sell them at an advance. What they mainly look to is the rise on shares in the market, and therefore any process of management which can promote this important object meets their approval. Hence, the keeping of two accounts, two bank pass-books, and two books of cheques. From the revenue account are drawn all payments for wages, rates, and taxes, coke, oil, and other petty furnishings, also repairs on carriages and locomotives, maintenance of way, and general management. What remains in the fund, whence is paid, first, the interest on debentures, and, second, the dividend of the shareholders. From the C. A. are drawn all other outlays: first, the repayment of principal to debenture holders, and, second, the expenditure for new carriages and locomotives, new rails, and other substantial repairs upon and additions to the plant. As all railway traffic exceeds the expectations formed respecting it, the demands on the C. A. for fresh additions of one kind or other, become exceedingly onerous. Were the shareholders to look to ultimate advantages, they would sanction the payment for permanent improvements out of the current revenue; but, as has been stated, shareholders for the most part care nothing for the remote and contingent prosperity of the undertaking, and will not, or cannot make a corresponding sacrifice. Greatly diminished by primary outlay, and now operated upon for all sorts of additions and improvements, the C. A. is at length exhausted, and new powers have to be got from parliament to create new shares and new debentures, and which shares are only taken up by being guaranteed a preferable claim on the funds of the company. Where a large extension of traffic must be provided for, the creation of fresh capital is indispensable and legitimate; but it is equally open to remark that the C. A., as usually conducted, affords the means of enormously increasing the company's obligations, and is, in fact, an expedient to give good dividends to present holders of stock at the cost of their successors. Perceiving what must be the consequences, those among the proprietary of the small and more prudently managed railways who look to permanent investment, lose no opportunity to urge 'that the capital account shall be closed, and the whole expenditure of the company, including the payment of dividends and interests, be taken from revenue.' Objections are raised to these remonstrances, sometimes on plausible, sometimes on sufficiently valid, grounds; and it may be said that in remarkably few cases have railway companies been able, or been disposed, to close their Capital Account. See RAILWAYS (Legislation and Management).

W. C.

**CAPITAL FELONIES.** See **FELON.**

**CAPITAL PUNISHMENT** in criminal juris-

prudence is the punishment of death. It is called *capital* punishment because the head (*Lat. caput*), from being the most vital, is usually that part of the body which is acted on. This applies especially to beheading and hanging; but almost all modes of depriving a criminal of life appear to have in view the peculiar vulnerability, and, at the same time, vitality of the head. This extreme penalty, notwithstanding the practice of the world from the remotest times down to the present day, has frequently been reprobated by philosophers and philanthropists, who have even gone so far as to deny the right so to punish to any earthly power. The weight of authority, however, appears in favour of capital punishment. Mr Bentham, one of the most reasonable and discriminating authorities on the subject, in his well-known and valuable treatise, says, that the idea of C. P. would naturally suggest itself in the infancy of a state. When any one had committed an offence, and disturbed the peace of society, the question would then first arise: 'How shall we prevent these things?' and, the answer most likely to occur to a set of barbarians would be: 'Extirpate the offender, and give yourself no further trouble about him.' And in conformity with this view of the matter, he alludes in a note to the case of the Hottentots, who have no fixed laws to direct them in the distribution of justice, and consequently, when an offence has been committed, there is no form of trial, or proportion of punishments to offences; but the kraal (village) is called together, the delinquent is placed in the midst, and without further ceremony, demolished with their clubs, the chief striking the first blow. The Marquis Beccaria, in his remarkable *Essay on Crimes and Punishments*, strongly argues against the capital sentence being carried out in any case, denying the right, in fact, of government so to punish, and maintaining, besides, that it is a less efficacious method of deterring others, than the continued example of a living culprit condemned, by labouring as a slave, to repair the injury he has done to society. Bentham, on the contrary, holds that death is regarded by most men as the greatest of all evils; and that especially among those who are attached to life by the ties of reputation, affection, enjoyment, hope, or fear, it appears to be a more efficacious punishment than any other. On the question of right, Beccaria is still more pointedly refuted by Sir Samuel Romilly, who observed: 'Beccaria and his disciples confess that it is not the greatest of evils, and recommend other punishments as being more severe and effectual, forgetting, undoubtedly, that if human tribunals have a right to inflict a severer punishment than death, they must have a right to inflict death itself' (*Memoirs*, vol. iii. p. 278). It is not a little interesting to know, that such was the opinion of one who did so much as a statesman to mitigate the severity of the criminal law.

Against C. P. arguments are often urged from Scripture, based on the general principle of Christian charity. To these it is replied that they proceed on a misapprehension and misapplication of the principle; and reference is confidently made to the Old Testament as sufficiently exhibiting the mind of the great Lawgiver in regard to this matter.

Death was, in former times in England, the ordinary punishment for all felonies, and the certain doom of those who could not avail themselves of *benefit of clergy* (q. v.), i. e., the common law inflicted death on every felon who could not read, and the law implied that punishment, where a statute made any new offence felony. On the other hand, the numerous acts of parliament creating felonies without benefit of clergy, shew that the statute law

## CAPITAL PUNISHMENT.

was still more sanguinary, so that of the 160 offences referred to by Blackstone as punishable with death, four-fifths had been made so during the reigns of the first three Georges. That some idea may be formed of such Draconian justice as was then established, we may mention the following as among the offences which involved sentence of death—stealing in a dwelling-house to the amount of 40s.; stealing privately in a shop goods of the value of 5s.; counterfeiting the stamps that were used for the sale of *perfumery*<sup>1</sup> and doing the same with the stamps used for the certificates for *hair-powder*. Thanks, however, to the exertions of Sir Samuel Romilly, the inhumanity and impolicy of such a state of the criminal code gave way, towards the end of the reign of George III., to a course of legislation which has reduced the application of death as a punishment within its present humane limits. Practically, indeed, it is only in the case of treason and murder that the capital sentence is ever pronounced; and even then, it is not always carried out, for the crown reserves to itself and exercises a right of review which frequently leads to such a change in the convict's fate as at least spares his life. This discretionary control on the part of the executive is essential in the present state of the law, which affords no means for a judicial appeal on the merits; for the very nature of the punishment, when finally executed, precludes the idea of all benefit to the sufferer, should the verdict of the jury afterwards turn out erroneous, and the innocence, instead of the guilt, of the accused be established. The law as it stands, indeed, allows a capital sentence to be reversed if technical error can be shewn on the face of the judgment or other matter of record—but what avails that, after the sentence has been executed?

In Scotland, the administration of the criminal law has perhaps been, on the whole, as severe as in England. Mr Erskine says, that 'those crimes that are in their consequences *most hurtful to society*, are punished capitally or by death,' a category that is certainly sufficiently indefinite; and anciently, it might be shewn that the executions in Scotland for offences corresponding to those which were capitally punished in England, were, in proportion to the population, quite as numerous as those in the latter country. But in the more modern practice of Scotland, capital sentence was only pronounced in the four pleas of the crown—viz., murder, rape, robbery, and wilful fire-raising, to which may be added housebreaking. At present the penal system in Scotland may be said to be identical with that in England, death, as a punishment, being only inflicted in the case of convictions for murder.

With respect to the mode of executing C. P., we need not detain the reader by any account of the obsolete cruelties and tortures of former times. It may suffice to state that *hanging* and *beheading* are the two methods which now, for the most part, are practised in the different European states, indeed, with the exception of Spain, by all. In the last country, the death of the culprit is instantaneously caused by the *Garrotte* (q. v.). In England, Scotland, and Ireland, and in all the dependencies of the crown, the convict is hanged; while in France he is decapitated by the *Guillotine* (q. v.), an instrument which an old Scotch machine called the *Maiden* (q. v.), and used for the same purpose, very much resembled. In most of the German states, beheading is the mode of execution adopted; but in Austria, criminals convicted of capital offences are hanged, as in England. See EXECUTION.

The following works may be consulted on the subject of this article: Basil Montagu *On the Punishment of Death*, 3 vols. (1809, 1812, 1813), in which

he collects the opinions of different eminent authorities; *Memoirs of Sir Samuel Romilly*, 3 vols. (1840), and his miscellaneous law-pamphlets; Jeremy Bentham's *Rationale of Punishment* (1830); Beccaria's *Essay on Crimes and Punishments* (1770); Edward Gibbon Wakefield's *Facts Relating to the Punishment of Death in the Metropolis* (1831); and Frederic Hill's *Crime, its Amount, Causes, and Remedies* (1853).

### CAPITAL PUNISHMENTS IN THE ARMY AND NAVY.—

1. *In the army*.—The law on this subject is contained in the 19th of the Articles of War now in force, which prescribes death as the punishment of the following offences, or such other punishment as by a court-martial shall be awarded. (1.) Any officer or soldier who shall excite or join in any mutiny or sedition in any forces belonging to her Majesty's army, or Royal Marines, or who shall not use his utmost endeavours to suppress it, and knowing of it, shall not give immediate information of it to his commanding officer; or (2) who shall hold correspondence with, or give advice or intelligence to, any rebel or enemy of her Majesty; or (3) who shall treat with any rebel or enemy without her Majesty's licence, or licence of the chief commander; or (4) shall misbehave himself before the enemy; or (5) shall shamefully abandon or deliver up any garrison, fortress, post, or guard committed to his charge; or (6) shall compel the governor or commanding officer to deliver up or abandon such place; or (7) shall induce others to misbehave before the enemy, or abandon or deliver up their posts; or (8) shall desert her Majesty's service; or (9) shall leave his post before being regularly relieved, or shall sleep on his post; or (10) shall strike or offer any violence to his superior officer, being in the execution of his office, or shall disobey any lawful command of his superior officer; or (11) who, being confined in a military prison, shall offer any violence against a visitor or other his superior military officer, being in the execution of his office.

By article 20, it is declared that no judgment of death by a court-martial shall pass, unless two-thirds at least of the officers present shall concur therein; and by article 21, it is provided that judgment of death may be commuted for penal servitude for any term not less than four years, or for imprisonment for such term as shall seem meet.

It would appear that the employment of a soldier in the service subsequent to his arrest on a capital charge, may operate as a remission of the sentence of death. This is illustrated by the following case, mentioned by Mr Prendergast in his *Law Relating to Officers in the Army* (2d ed., 1806, p. 245): In 1811, private John Webbin of the 3d Buffs was sentenced to be shot. The commander-in-chief, the Duke of Wellington, in his 'Remarks' upon the proceedings, took notice that, through some extraordinary inattention, the prisoner had actually been permitted to serve in an engagement with the enemy, after he had been put into arrest for his crime. On this ground, the duke pronounced that he was under the necessity of *pardoning* the prisoner.

In the army, C. P. is inflicted by the offender being either shot or hanged—the latter being the more disgraceful mode of execution.

2. *In the navy*.—These are regulated by the 22 Geo. II. c. 33, amended by the 10 and 11 Vict. c. 59. By the first of these acts, certain offences in the navy, whether on board ship or on shore, were punished with death absolutely, without any discretion in the court to alter or mitigate the sentence. But, by the 10 and 11 Vict., this severity is removed (excepting in the cases of murder and other unnatural offences mentioned in the act), and courts-martial are authorised to abstain from pronouncing judgment

## CAPITALS—CAPITOL.

of death, if they shall think fit, and to impose such other punishment instead as the nature and degree of the offence may deserve. In this discretionary sense, the following offences are punishable, in the navy, with death: (1) The holding illegal correspondence with an enemy; (2) the not acquainting, within 12 hours after the opportunity to do so, the commander-in-chief, or other superior officer of the squadron, with any message from an enemy or rebel; (3) all spies bringing seducing letters from an enemy or rebel, or endeavouring to corrupt any one in the fleet to betray his trust; (4) the relieving an enemy or rebel in any way, directly or indirectly; (5) not preparing for fight when duty commands, or not making due preparations on likelihood of engagement, and not encouraging the inferior officers and men to fight courageously; (6) the treacherously or cowardly yielding or crying for quarter; (7) disobeying orders in time of action, or not using all possible endeavours to put the same effectually in execution; (8) being guilty of cowardice or neglect of duty in time of action; (9) through cowardice, negligence, or disaffection, forbearing to pursue the chase of any enemy, pirate, or rebel, beaten or flying, or not relieving or assisting a known friend in view to the utmost; (10) deserting to the enemy, or running away with any of her Majesty's ships or their belongings, or any pieces to the weakening of the service, or cowardly or treacherously yielding up the same; (11) deserting simply, or enticing others so to do; (12) making, or endeavouring to make, any mutinous assembly on any pretence whatsoever; (13) uttering words of sedition or mutiny; (14) concealing traitorous or mutinous practices or designs; (15) striking a superior officer, or offering any violence to him, being in execution of his office, on any pretence whatsoever; (16) unlawfully burning or setting fire to any ship property or furniture, not then appertaining to an enemy, pirate, or rebel; (17) neglect in steering any of her Majesty's ships, so that the same be stranded, split, or hazarded; (18) sleeping on watch, or negligently performing duty, or forsaking station; and (19) robbery.

It is stated by Mr Prendergast, in the work to which we have referred (p. 244), that a sentence of death pronounced by a court-martial does not operate as an absolute dismissal from the service; for if the offender should be pardoned, he is restored to his former position.

But though a pardon operates as a restoration to the service, the greater question still remains to be judicially decided, whether a restoration to the service operates as a pardon. This question is inseparably connected with the fate of the gallant but unfortunate Sir Walter Raleigh. He had been condemned to death for alleged participation in a treasonable plot to raise Arabella Stuart to the throne; and, after undergoing 13 years' imprisonment, he received from James I., by a commission under the Great Seal, the command of a fleet and army fitted out against the Spanish possessions in South America, with power of life and death over the king's subjects serving in the expedition. The enterprise failed; and on Sir Walter's return to England, James caused his head to be struck off, according to the sentence originally pronounced. On shewing cause against his execution, Sir Walter pleaded that his commission was tantamount to a pardon, and quoted a case of a man who had been condemned for felony, having been pardoned on account of his subsequent service in the wars of Gascony. Lord Chief-Judge Montague, however, held that though an implied pardon of the kind cited might hold good in felony, that treason could only be pardoned by express words. There is the high legal authority of the late Lord Chancellor

Campbell\* for saying that the chief-justice declared and expounded the law soundly; and that in strictness Sir Walter's attainder, under the former judgment, could only be done away with by letters-patent under the Great Seal, expressly reciting the treason, and granting a free pardon. See, on the subject of these two articles, ARTICLES OF WAR, and MUTINY ACT.

As to the mode of C. P. in the navy, the culprit, where he is an officer, is shot; where he is a common seaman, he is usually hanged at the yard-arm.

CAPITALS (*majuscula*), in contradistinction to small letters (*minuscula*), are the large letters employed in writing and printing to help the eye, to relieve the uniformity of the page, to increase the facility of keeping and finding the place, to mark the beginnings of sentences, proper names, &c.—Among the ancients, and during the earlier part of the middle ages, no distinction of C. and small letters was known; and after the practice had been introduced of beginning books and chapters with great letters often adorned or illustrated with much artistic ability, it was long before C. were employed in such a way as could afford much real advantage to the reader. At the present day, they are universally employed, even in the printing of Greek and Latin books. Considerable diversity has existed at different times with regard to the employment of them, the books of the 17th and 18th c. exhibiting a much greater proportion of them than those of the present day. In German books, all substantives usually begin with a capital letter; in English and French books of the present day, they in general appear only at the beginnings of sentences and of proper names. Adjectives formed from proper names, as *English*, *French*, &c., are generally begun with a capital in English books, but not in French nor in German ones.

CAPITANATA, a province of Italy, corresponding to the *Dawnia* of the ancients, is bounded N. and E. by the Adriatic, and on the S. W. by the Apennines. It stretches along the Adriatic about 70 miles in a straight line, and its average breadth is about 45 miles; but its coast-line, measuring round the great promontory of Monte Gargano, which has been called 'the spur of Italy,' is fully 100 miles, and its breadth between the extremity of that projection and the Apennines, 75 miles. Pop. (1871), 319,164. The greater part of the surface is a sandy plain sloping from the Apennines to the Adriatic, and watered only by some inconsiderable streams. The rearing and feeding of cattle form the chief occupations of the inhabitants. Wheat, wine, and fruits of various kinds are produced in quantities sufficient to admit of exportation. There are important salt-works, quarries of alabaster, and potters' clay. Foggia is the chief town.

CAPITATION, from the Latin *caput*, a head, means something applicable to all persons, or to the people by the head. A tax levied on all persons, without reference to property or other incidents, is called a C. tax, and sometimes a poll tax. The former term was often used in France for the tax better known as the *taille*, although this offensive impost was not imposed on all alike, the nobility enjoying many exemptions from it.

CAPITOL, the fortress of ancient Rome, and site of the national sanctuary the temple of Jupiter, was situated on the *Mons Capitolineus*, the smallest but most famous of the seven hills on which Rome was built. The hill itself was first termed *Mons Sacerdosinus*, afterwards *Mons Tarpeius* and *Rupes Tarpeia*, and after the foundation of the Capitol, *Mons*

\* *Lives of the Chief-Judges*, vol. i. pp. 357, 358.

and abrupt in almost every part, formed a natural fortress, and was strengthened here and there by towers. The C. was founded by Tarquinius Priscus, and completed by Tarquinius Superbus, who tasked the people to work at it. The whole mount had a circumference of about 800 paces. During the civil wars under Sulla, the temple was burned (according to Tacitus, by design), and after its restoration, destroyed during the Vitellian riots. It was rebuilt by Vespasian, after whose death it was again destroyed by fire, but was once more restored by Domitian, who instituted here the Capitoline Games. Domitian's structure lasted to a late period of the empire. Regarding the site of the C., there has been great dispute; the German scholars, for the most part, maintaining that it occupied the south-west summit of the hill, and the Italians, the north-east. The latter situation has the weight of probabilities in its favour. From that portion of the mount named the Tarpeian Rock, state criminals were thrown down. According to the description given by Dionysius of Halicarnassus, the temple of Jupiter, with its peristyle of columns, was 200 feet long by 185 feet wide, and was divided into three cells, separated from each other by walls, and respectively dedicated to Jupiter, Juno, and Minerva. In the spacious portico, the people feasted on triumphal occasions. The scanty ruins remaining in the present day consist of a substructure of peperino or volcanic tufa, a wall of the same materials, and some remains of the south front, together with a portion of the great flight of steps leading to the temple.

The modern C. (*Campidoglio*), built on the site, and partly on the foundation of the ancient C., was designed by Michael Angelo, but is one of his inferior works. The main entrance, however, presents a splendid view. It is used as a kind of hotel-de-ville and museum.

Besides the great temple of Jupiter, the most important structures on the Capitoline Mount were the temple of Jupiter Tonans, built by the Emperor Augustus; and the magnificent *Tabularium*, containing archives, and, in connection with the *Araarium* ('Treasury'), serving as a library and place for lectures, &c. The remains of this structure, built by Quintus Catulus, 73 B.C., have still an imposing aspect.

**CAPITULARIES** (Lat. *capitularia*). *Capitularium* is literally a book divided into chapters; and the plural of the word was the name given to the laws issued by the kings of the first and second of the Frankish races, from Charles Martel downwards. These laws proceeded from the great assemblies of the king, nobles, and bishops, which formed the states of the kingdom, and, from their general character, were opposed to the laws issued for the separate states, which were called *legea*. They were divided into general and special C., according to the more or less general nature of the interests which they embraced, and the mode of their publication. They have by no means been all preserved. The most famous are those of Charlemagne and of St Louis. In 827, Abbot Angesius, of Fontenelles, made a collection of the C. of Charlemagne, and of his son, Louis le Débonnaire. Other collections were made by private persons, and, in 847, one by authority of the king, but they are all very imperfect and ill arranged. After Charles the Simple, in 922, no more C. were issued, and no similar laws or statutes exist from that period till the time of Louis le Gros, in 1100. The best collections are those of Baluze (Paris, 1677 and 1780), and of Pertz, in the *Monumenta Germaniae*.

592

In the military sense of the word, a C. is a treaty of surrender to an enemy. When a place can no longer be defended, on account of failure of ammunition or provisions, or the progress made by the besieging-party, a white flag is commonly put up, as a sign that the besieged are willing to capitulate. According to the kind and degree of peril in which the fortress is placed, so are the terms which the governor may reasonably expect from his successful opponent. Sometimes the arms and military stores are left to the besieged, but more frequently they are taken by the besiegers, except articles of private property belonging to the officers and men. The 'honours of war,' the marching out with drums beating and colours flying, are usually stipulated for, unless the conqueror exacts very severe terms. The mildest form of a C. is a convention, agreed to when the conqueror is not strong enough to insist on stringent conditions.

**CAPIZ**, a town on the island of Panay, in the Philippine Archipelago. It is situated on a plain on the north coast, near the rivers Panay, Panitan, and Ivisan, by which it is sometimes inundated during the rainy season. It is defended by a small fort, and is the residence of a Spanish alcalde. Pop. 11,000.

**CAPNOMANCY**, a word formed from the Greek *capnoe*, smoke, and *manteia*, divination. The ancients practised it in two different ways—either they threw grains of jasmine or poppy on the burning coals, and watched the motions and the density of the smoke that rose from them, or they watched the smoke of sacrifice. This latter kind of C. was most generally employed, and that to which the greatest importance was attached. If the smoke was thin, and ascended in a right line, instead of being blown back by the breeze, or spreading over the altar, the augury was good. It was also believed that the inhalation of the smoke rising from the victims or from the fire which consumed them, gifted the priests with prophetic inspiration.

**CAPO D'ISTRIA**, a fortified seaport town of Austria, situated on a rocky island in the Gulf of Trieste, 8 miles south-west of the city of Trieste. It is capital of the circle of Istria, with the peninsula of which it is connected by a stone causeway, nearly half a mile long. Its old buildings, ruinous walls, and narrow streets, give the town a gloomy aspect. It has a cathedral, manufactures of leather and soap, and a trade in wine, oil, and salt. Pop. 6870. In ancient times, this place was known as *Higida*, and afterwards as *Justinopolis*, in honour of Justin II, who restored it.

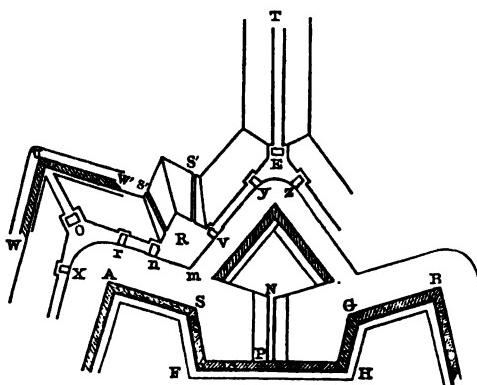

**CAPO D'ISTRIA, or CAPO D'ISTRIAS, JOHN ANTHONY**, COUNT, president of the Greek republic from 1827 to 1831, was born in Corfu, 1780. His family had been settled in that island since the 14th c., but originally came from the Illyrian town of Capo d'Istria (q.v.), near Trieste. He devoted himself to political life, and after having held a high position in the Ionian Islands, he entered the diplomatic service of Russia. Here his diplomacy tended to the separation of Greece from Turkey. In 1827, he was elected president of Greece; and in January 1828, he landed in Greece, and entered upon the duties of his office. He was a patriot, a philanthropist, and an able diplomatist, but by no means equal to the task which he now undertook. Everything was in disorder; the people had been long enslaved, and knew not how to use their freedom; and the president had been so much imbued with the centralising principles prevalent at the courts

## CAPONIERE—CAPRI.

which he had frequented, that some of his measures, especially that restricting the liberty of the press, gave offence to the most temperate of the enlightened lovers of civil liberty. His career was cut short by his assassination in a church at Nauplia on October 9, 1831. The assassins were relatives of Peter Mauroichali, against whom he was urging on a prosecution, for alleged offences against the state.

**CAPONIERE**, or **CAPONNIÈRE**, in Fortification, is a parapet 8 or 10 feet high, with a superior slope, terminating in a small glacis. It is placed in the ditch of a fortified place, to cover or screen the defenders while passing from one defence-work to another. Generally, it has a banquette, on which musketeers may stand to fire over the crest. If there is a passage between two such parapets, it is a *full caponnière*; if on one side only, a *half caponnière*. Generally, the parapets are of earth, and the passage open overhead; but sometimes caponnières are vaulted galleries of brickwork, loopholed at the sides for musketry; while in field-works, palisade caponnières are occasionally thrown across the ditches of redoubts.

Reserving to the article **FORTIFICATION** a notice of the connecting-links between various defence-works, we give, in the annexed cut, a plan of what is called a *front* of fortification, illustrating many parts already described in the *Encyclopædia*, and

Front of Fortification.

many others still remaining to be described. *ASF* is one half of a *bastion*; *BGH*, one half of another bastion; *AS, BG* are *faces* of the bastions; *SF, GH* are *flanks*; *A* and *B* are *salient angles*; *S* and *G* are *shoulders*; *F* and *H* are *re-entering angles*; *FH* is the *curtain* between two bastions; *PN* is the *caponnière*, stretching across the main ditch from the curtain to the ravelin *N*; the white space on which the letters *XAmSVyzGB* stand is the *ditch*; *ORE* is the *covert* or *covered-way*; *R* is the *place of arms*; *S', S* are *sally-ports* cut through the *glacis*; *X, r, n, V, y, z*, are *traverses*; *WUW* is a *fleche*, outside a salient angle of the *glacis*; *OU* is a second *caponnière*, leading to the *fleche*, with a *traverse* at *O*; *E, T* are a *traverse* and a *caponnière* leading to a *redoubt* supposed to be beyond the *glacis*; a line in the direction *UA* would describe the *capital* of one of the bastions.

**CAPPADOCIA**, anciently, a province, and subsequently a kingdom in the west of Asia (in part the present Caramania). It was bounded by Lycaonia on the *W.*, by Cilicia and Syria on the *S.*, by Armenia on the *E.*, and by Pontus on the *N.* During the time that it belonged to the Persian

empire, however, it included Pontus, which was called Lesser Cappadocia. In 17 A.D., C. was erected into a separate province of the Roman empire, by Tiberius.

**CAPPAGH BROWN**, a bituminous earth, which yields pigments of various shades of brown, the two most strongly marked being known as Light and Dark Cappagh Brown. The colouring matters are oxide of manganese and iron. The C. Browns are transparent and permanent; and when not applied too thickly, they dry well in oil. The name is derived from Cappagh, near Cork, in Ireland. C. B. is also called Encrume Mineral, and more frequently, Manganese Brown.

**CAPPARIDÆ**, or **CAPPARIDACEÆ**, a natural order of exogenous plants, allied to *Cruciferae*, and including about 350 known species, herbaceous plants, shrubs, and trees, mostly natives of tropical and sub-tropical countries. The leaves are generally alternate, stalked, undivided, or palmate; the flowers solitary or clustered; the calyx of four sepals, sometimes cohering in a tube; the corolla of four, or sometimes eight petals, sometimes wanting, the stamens generally a multiple of four, or indefinitely numerous, placed on a hemispherical or elongated disk; the ovary one-celled, the style thread-like or wanting; the ovules curved; the fruit either dry and pod-like (tribe *Cleomes*), or a berry (tribe *Capparaceæ*).—To this order belongs the well-known *caper-bush*. See *CAPER*. Many of the species possess stimulant properties; some are poisonous. One of the most interesting plants of the order is the *Siyâk* (*Capparis sordata*), a bush or small tree, one of the most characteristic features of the vegetation of Africa, from the Great Desert to the Niger, the small berries of which have a pungent taste like pepper, and when dried, constitute an important ingredient in the food of the inhabitants of those regions; whilst the roots when burned yield no small quantity of salt.—*Burk's Travels*.

**CAPPEL**, a village of Switzerland, in the canton of Zurich, and ten miles south-south-west of the city of that name. It is interesting as the place where the great reformer Zwinglius was killed in a conflict with troops of the Roman Catholic cantons, October 1531. A monument has been erected here to his memory.

**CAPRI** (the ancient *Caprea*), a charming island in the Mediterranean, at the entrance of the Bay of Naples, about three miles from Cape Campanella, and twenty miles south of the city of Naples. On its small area of about eleven miles in circumference, it displays a rich variety of beautiful scenery, ruins of antiquity, and points of historical interest, and contains a population of about 6000 souls. The island is composed of two mountain masses, separated from each other by a depression like the seat of a saddle. That on the west, called Monte Solaro, which is the highest and largest, has an elevation of about 1900 feet. The eastern part does not attain a height of more than 860 feet above the sea. At the base of the eastern mountain is situated the town of C., built on a shelving rock, and guarded by walls, gates, and draw-bridges, with a cathedral, and a population, including the district, of about 4000. It commands a beautiful prospect, and communicates with the little town of Anacapri, on the western table-land, by a flight of 535 rude steps, cut in the face of the rock. There are only two safe landing-places on the island, and these are at C. and near it. C. was a celebrated place, in the times of Augustus and Tiberius. Ruins are still found of Roman baths and aqueducts, and of the twelve grand villas or palaces

built in honour of the twelve chief deities by the Emperor Tiberius, who passed the last ten years of his life here in the practice of the grossest licentiousness and cruelty. The inhabitants now consist of fishermen, sailors, and a few traders, with vine-dressers and cultivators of olives in Anacapri. Wherever a tree can be planted, the hopeful and industrious people have prepared for it a soil by persevering toil in terrace-culture. Delicious quails, which in vast numbers alight on the island during their migrations to and from Africa, in spring and autumn, are taken in nets, and form an important item in the resources of Capri. To the west of the town of C. is situated the *Grotta Azzurra* (Blue Grotto), a remarkable cavern, entered from the sea by a narrow opening not more than three feet high. Inside, however, it is found to be of magnificent proportions, and of marvellous beauty, the gorgeous colouring being said to be produced by the reflection and refraction of the sun's rays through the water. Elliptical in form, it has a length of 165 feet, a breadth of 100 in the widest part, and a height of 40 in the loftiest, with 48 feet of water beneath.

CAPRICCIO (Ital.), in Art, is applied to a picture or other work which designedly violated the ordinary rules of composition. Foliated ornaments, with Cupids or other figures appearing in them in situations not strictly natural, are capriccios.

CAPRICCIO, in Music, is a species of free composition, without being subject to rule as to form or figure. Locatelli, at the beginning of the 18th c., composed capriccios for the violin. The most celebrated C. of modern times is Mendelssohn's B minor C. for pianoforte and orchestra.

CAPRICORNUS, the Goat, a southern constellation, and the tenth sign of the zodiac (q. v.); denoted by the sign ♑, representing the crooked horns of a goat. It is usually represented on the globe as having the forepart of a goat, but the hinder part of a fish (see fig.). It is one of the least striking of the zodiacal constellations. It was, however,

Capricornus.

celebrated among the ancients, who regarded it as the harbinger of good fortune, and as marking the southern tropic or winter solstice, wherefore they called it the 'Southern Gate of the Sun.' It contains no large stars, the two largest, which are situated in the horns, being only of the third magnitude. Neither of these rises above the horizon in our latitude. See TROPICS.

CAPRIDÆ, a family of ruminant quadrupeds, which, as defined by some naturalists, may be described as the Sheep and Goat family, including

594

the Linnaean genera *Ovis* (Sheep, q. v.) and *Capra* (Goat, q. v.); but which is extended by others to include Antelopes, their persistent horns being regarded as the great distinction between them and the *Cervidae* or Deer family. In the more restricted sense, the name designates a very natural family, yet differing from the *Bovidae* or Ox family more in general appearance than in other characters; whilst links of connection with the Antelopes are not wanting, a very remarkable one being found in the Prong-horn of America.

CAPRIFICATION, a method which has long been employed in the Levant for securing and hastening the maturation of figs, and which consists in suspending fruit-bearing branches of the wild fig above or beside those of the cultivated tree. The notion once entertained, that this practice is analogous to that by which the fecundation of the female palm-tree is secured, is inconsistent with the now well-known fact, that the fig has both male and female flowers within its own receptacle; and it is therefore supposed that the effects of C. may result from the agency of a species of insect, of which the eggs have been deposited in the early wild figs, and which may promote fecundation by entering the receptacle of the cultivated fig, or perhaps by puncturing it may cause it to ripen sooner. In hope of a similar advantage, some French and English cultivators have inserted into figs straws dipped in olive-oil. But C. is scarcely practised in the western parts of Europe, and has even been discontinued as unnecessary in some parts of the east where it once prevailed.

CAPRIFOLIA'CÆ, a natural order of exogenous plants, consisting of shrubs and herbaceous plants, which have opposite leaves without stipules, and flowers disposed in corymbs, in heads, or in whorls. The calyx is 4—5-cleft; the corolla monopetalous, tubular, or wheel-shaped, sometimes irregular. The stamens are adherent to the corolla at its base, and alternate with its lobes. The ovary is free, 1—5-celled. The fruit is generally a berry, sometimes dry, but not splitting open when ripe. The order is very nearly related to *Cinchonaceæ*, differing chiefly in the want of stipules. More than 200 species are known, chiefly natives of the temperate and colder parts of the northern hemisphere. To this order belong the Honeysuckle, Elder, Viburnum, and Snowberry. Emetic and cathartic properties are prevalent in it.

CAPRIMULGIDÆ, a family of birds, of the order *Insecessores*, and tribe *Fissirostræ*, nearly allied to the *Hirundinidae* or Swallow tribe, but differing from them in the still greater width of gape, and in having long stiff bristles at the base of the bill. They are insectivorous birds. They have very long wings, short legs, and toes united at the base by a membrane. The European goatsucker may be said to be the type of the family, which includes also the Whip-poor-will and Night-hawk of America, with many other species widely distributed over the globe, and now arranged by naturalists in a number of genera.

CAPSALI, a seaport town of the Ionian Islands, capital of Cerigo, or Cythera, is built upon a narrow ridge, terminating in a precipitous rock near the south end of the island. It has an old castle and a good harbour. Pop. 5000.

CAPSICINE, an alkaloid, is the active principle in capsicum or Cayenne pepper, and can be obtained from it. It is a thick liquid, of a reddish colour, and possessing such acrid properties, that half a grain diffused through a large room causes every one therein to sneeze violently.

## CAPSICUM—CAPTAIN.

CAPSICUM, a genus of plants of the natural order Solanaceæ, having a wheel-shaped corolla, projecting and converging stamens, and a dry berry. The species are all of a shrubby, bushy appearance, and have more or less woody stems, although they are annual or biennial plants. The number of species is very uncertain, some botanists distinguishing many, whilst others regard them as mere varieties of a few. They are natives of the warm parts of America and of Asia, have simple leaves, and rather inconspicuous flowers, and some of them are in very general cultivation in tropical and sub-tropical countries for their fruit, which is extremely pungent and stimulant, and is employed in sauces, mixed pickles, &c., often under its Mexican name of *Chillies*; and when dried and ground, forms the spice called *Cayenne Pepper*. As a condiment, it improves the flavour of food, aids digestion, and prevents flatulence. In tropical countries, it counteracts the enervating influence of external heat. In medicine, it is used as a stimulant, rubefacient, and vesicant; is often administered in combination with cinchona; and is particularly valuable both internally administered and as a gargle, not only in relaxed conditions of the throat, but in some of those diseases in which the throat is most dangerously affected. As a medicine, C. is administered in pills mixed with bread; in the form of tincture, obtained by digesting the bruised C. in alcohol; or of an infusion, procured by digestion in water, with varying proportions of salt and vinegar. A gargle of C. is prepared by infusing it in water, along with candy-sugar and vinegar, and thereafter adding a little infusion of roses. It has no narcotic properties. It owes its power chiefly to *Capsicine* (q. v.). The fruits of the different species of C. differ in form, being round, oval, conical, heart-shaped, &c.; they vary from half an inch to four inches in length, and are sometimes of a bright red, sometimes of a yellow colour. In all, the dry berry has an inflated appearance, and contains numerous whitish flattened seeds, which are even more pungent than the leathery epidermis, or the spongy pulp. Cayenne pepper consists chiefly of the ground seeds. *C. annuum*, sometimes called Common C., or Chilly Pepper, is perhaps the most common species in cultivation; and in the southern parts of Britain, if raised on a hotbed as a tender annual, it produces fruit in the open border. There are several varieties of it. *C. frutescens*, sometimes called Goat Pepper, and *C. baccatum*, sometimes called Bird Pepper, have greater pungency, and the former is generally described as the true Cayenne Pepper. *C. cerasiforme*, with a small cherry-like fruit, and therefore called Cherry Pepper, and *C. grossum*, with a large, oblong, or ovate fruit, known as Bell Pepper, are frequently cultivated.—The fruit is used either ripe or unripe, except for making Cayenne Pepper, for which ripe fruit is employed. The fruit brought from South America is sometimes sold by druggists under the name *Guinea Pepper*.

CAPSTAN, on shipboard, is a ponderous mass of timber, whose uses are to heave the anchor, hoist up masts and guns, take in and discharge cargo, &c. It has very firm supports on the deck underneath it. It comprises a barrel, round which a rope or a chain coils; whelps, or pieces of timber, which enlarge the diameter without greatly increasing the weight; the drum-head, a polygonal flat piece of timber at the top, pierced laterally with holes; the step, or lowest part, which rests upon and is bolted to the beams; the saucer, an iron socket let into the top of the step; the pivot or spindle, which resting on the saucer, forms the axis around which the C. turns; the pawls, short bars of iron, to prevent the re-action of the C.; bars, which enter the

holes, and are the levers for enabling the sailors to work the C.; pins, placed vertically through the drum-head, for temporarily retaining the bars in their places; and the shifter, a rope connecting the outer ends of the bars. Many improvements have recently been made in the arrangement and action of capstans; among which is Wardill's, for increasing the bite or holding of a chain-cable around the circumference.

CAPSULE, in Botany, a dry fruit, syncarpous (or formed of several carpels united together into one), and opening either by valves, as in the fox-glove, primrose, and rhododendron, or by pores near the summit, which some regard as a sort of valves, and of which beautiful examples may be seen in the poppy and snapdragon. Capsules are either one-celled or many-celled. The *Pyxidium* is a variety of C., which opens as if cut around near the summit, presenting the appearance of a cup with a lid, of which a very beautiful example may be seen in the *Anagallis*, or Pimpernel; and another in the great woody fruit of the different species of *Lecythis* and other *Lecythidaceæ*.

CAPTAIN, MILITARY, is perhaps the most general designation given to an officer of land forces; something equivalent to it being found in most European languages. As a word, it simply means a head or leader, and may be applied to a chief over any number of men. Captain-general is in some countries a very high command. In the time of Queen Elizabeth, there was, among other high military officers, a Captain-general of footmen. In the organisation of the British army at the present day, there is one C. to every company of infantry, and every troop of cavalry. Formerly every battery of artillery had two captains—a first and a second, the latter being called C.-lieutenant. Now, the first in command has the title of major, and the second that of C. The first in command of a battery of artillery, even when styled C., was considered higher than a C. of infantry or cavalry, and was privileged to be mentioned by name in military despatches, like colonels and majors.

The duty of the C. is to see to the men of his company in everything that relates to discipline, exercises, billeting, pay, settlement of accounts, mess, kit, clothing, arms, ammunition, accoutrements, stores, barracks, cooking, &c.; to receive orders concerning these matters from the major, and to enforce these orders among the men. He is responsible to the major, and is assisted in his duties by the lieutenant and sub-lieutenant. The Army Estimates for 1873—1874 provide for 239 captains of cavalry, 1236 of infantry, 243 of artillery, 115 for engineers, and 28 for colonial corps—1866 in all, in full commission. The former value of a C.'s commission, and the circumstances of purchase connected with it, are noticed under COMMISSIONS, ARMY.

CAPTAIN, NAVAL, is the general designation for the commander of a ship. It is not universal, for some vessels of war are commanded by officers lower in rank than C.; while the chief officer of a merchant-vessel is often called master. The commanders of all rated ships are captains. The captains rise to the command of larger and larger ships, with increase of pay, according to length of service. The C. is responsible for everything on shipboard, in discipline, navigation, equipment—all, in short, that concerns the personnel or the material of the ship. If his ship belongs to a particular fleet or naval station, he is responsible to some admiral or commodore; if not, he is directly responsible to the Admiralty. The C. of that particular ship in a fleet which carries the admirals

CAPTION—CAPUCHIN MONKEY.

is called *Flag-C.*, and is for the moment higher in rank than others. A naval officer is always on half-pay, except when attached to a ship in actual commission; and thus in times of peace there have been always more naval captains on half than on full pay; but recent measures have been adopted to assuage this evil. The Navy Estimates for 1873–1874 provide for about 83 captains in commission on full-pay. About 142 are provided for on half-pay, under the designation of the *active* list: these are eligible for re-employment; while on the *reserved* list and the *retired* list are 426 more. They rank in dignity with lieutenants-colonels in the army, and with colonels after three years' service.

The word C. is used in other ways also in the navy. The *C. of the Fleet* is a temporary officer in large fleets; he promulgates the admiral's orders, and receives all the reports and returns, filling, in short, a post equivalent to that of *Chief of the Staff* in an army. Among the seamen on board a ship, the chief of each gang is called C.; such as the C. of the after-guard, of the forecastle, of the hold, of the main-top, of each gun, &c.

**CAPTION**, in the practice of the law of England, may be defined as that part of a legal instrument which shews the authority under which it is executed, or taken, as the word implies. It also states the time and place of the execution. The word C. is also improperly used in England to signify an arrest—a meaning which it strictly and technically bears in Scotland, where, until the passing of the 1 and 2 Vict. c. 114, called the Personal Diligence Act, which authorised more simple forms of legal process, it was the only recognised civil warrant for the apprehension of a debtor or obligee. This word is also used in Scotland to denote a summary warrant of imprisonment, granted on the application of the clerk of court, for the purpose of forcing back the pleadings and other papers in a lawsuit, which had been borrowed by the party against whom the C. has issued, and by whom they are unduly and illegally retained. See on the subject of this article **INDICTMENT, COMMISSION, DILIGENCE, WARRANT, HORNING**.

**CAPTIVES.** It is laid down by Blackstone, that, as in the goods of an enemy, so also in his person, a man may acquire a sort of qualified property in him as a captive or prisoner of war—at least till the ransom of the captive is paid. In Scotland, all legal proceedings against a captive are stopped till his liberation, although, in some cases, execution against his estate may proceed.

**CAPTURE** may be simply defined as prize taken in time of war. The law on this subject is stated with precision in a paper addressed on behalf of the British government to the American ambassador at London in September 1794: ‘When two powers are at war, they have a right to make prizes of the ships, goods, and effects of each other, upon the high seas. Whatever is the property of the enemy, may be acquired by capture at sea; but the property of a friend cannot be taken, provided he observes his neutrality. Hence the law of nations has established—that the goods of an enemy on board the ship of a friend may be taken—that the lawful goods of a friend on board the ship of an enemy ought to be restored—that contraband goods going to the enemy, though the property of a friend, may be taken as prize; because supplying the enemy with what enables him better to carry on the war, is a departure from neutrality.’ The procedure to be adopted for determining whether the C. be or be not lawful prize, is now regulated by the 3 and 4 Vict. c. 65.

During the Russian war in 1854, there appeared in the *London Gazette*, under date the 28th March of that year, a declaration stating, *inter alia*, that her Majesty would waive the right of seizing enemy's property laden on board a neutral vessel, unless it be contraband of war, and that it was not her Majesty's intention to issue letters of marque for the commissioning of privateers. The right of seizing enemy's property on board a neutral vessel, whether contraband of war or not, had always before been maintained by England. On the re-establishment of peace with Russia, a treaty was signed, and the following declarations adopted: 1. Privateering is and remains abolished; 2. A neutral flag covers an enemy's goods, with the exception of contraband of war; 3. Neutral goods, with the exception of contraband of war, are not liable to C. under an enemy's flag; 4. Blockades, in order to be binding, must be effectual—that is to say, maintained by force sufficient to prevent effectually access to the coast of the enemy.

As to the right to property captured from the enemy, and its distribution as prize or booty of war among the officers and men of the army and navy, see **BOOTY** and **PRIZE**.

**CAPUA**, a fortified city of Italy, in the province of Caserta, beautifully situated in a rich plain, on the left bank of the Volturno, about 18 miles north of the city of Naples, with which it is connected by railway. It is a military station of the first class, its defences having been greatly extended and improved by Vauban. As it is the only fortress which guards the approach to Naples from the north, it was regarded as one of the keys of the former kingdom of that name. The only objects of interest in the city are the cathedral, with some splendid granite columns from ancient *Casilinum*, upon whose site C. was built in the 9th c.; the church of the *Annunziata*, with some bas-reliefs; and the arch of the *Piazza dei Giudici*, under which many ancient inscriptions are preserved. Pop. 10,000.

The ancient *Capua*, which enjoyed a reputation for wealth and population second only to Rome and Carthage, was situated about two miles south-east of the present city, where its ruins are still to be seen, its site being occupied by the modern town of Santa Maria di Capua. C. was founded by the Etruscans, under the name of *Volturum*, as early, according to some authorities, as 800 B.C., and was the chief city of the twelve said to have been founded by them in this part of Italy. Its present name was derived from the Samnites, who captured it in 423 B.C. After the battle of Cannae, 216 B.C., the popular party opened the gates to Hannibal, whose army was greatly enervated by its luxurious winter-quarters here. The Romans obtained possession of the city in 211 B.C. In the 5th c. A.D., C. was devastated by the Vandals under Genseric. It recovered its prosperity again to some extent, but it was totally destroyed by the Saracens in 840. The citizens, who had fled to the mountains, were induced by their bishop to return some 16 years later, and found the modern Capua. From the remains of the ancient C., it has been estimated that it had a circumference of 5 or 6 miles, and a population of 300,000. It had seven gates. Among the Roman antiquities, one of the most remarkable is the amphitheatre, built of bricks, and faced with white marble. Well-preserved arches, corridors and seats for spectators, still remain. It is calculated to have been capable of holding 100,000 persons, and must have been altogether one of the most magnificent buildings of the kind in Italy.

**CAPUCHIN MONKEY**, or **CAPUCHIN SAPAJOU**, a name often given to *Cebus capuchinus*,

## CAPUCHINS—CARACAL.

and some other species of the genus *Cebus*, South American monkeys, which have the head covered with short hair, so disposed as to resemble the cowl of a capuchin, the face being almost naked, or only covered with a little down. See *Cebus*. *Pithecia chiropotes*, a South American monkey of a genus

Capuchin Monkey (*Pithecia chiropotes*).

allied to *Cebus*, is also sometimes called the C. M., or Capuchin of the Orinoco.

CAPUCHINS, a branch of the order of *Franccans* (q. v.), so designated from the *capuc* which is their head-dress.

CAPUDAN-PASHA', the High Admiral of Turkey. He has the entire command of the navy, and the management of all naval affairs. The port of Pera, contiguous to the arsenal, the Turkish islands in the Archipelago, and a number of seaports and maritime districts, are under him, even in their civil administration.

CAP'PUT MO'RTUÜM VITRI'OLI, or COL'COTHAR, is the name given by the alchemists to the red powder (mainly red oxide of iron) which remains in the retorts when green vitriol or the sulphate of iron is calcined.

CAPYBARA (*Hydrocharus Capybara*), a quadruped of the order *Glires* or *Rodentia*, and of the

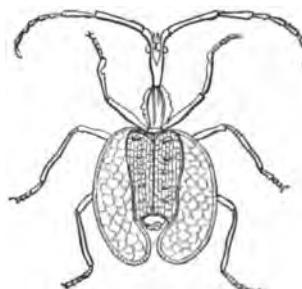

Capybara (*Hydrocharus Capybara*).

family *Cavidae*, strongly resembling the Cavy or Guinea-pig, although it is the largest existing rodent known, and aquatic in its habits. It is a native of South America, and abounds in many of the large

tropical rivers. It is equal in size to a small pig. The dentition resembles that of the cavy, except that the grinding teeth are composed of numerous transverse plates, the number of the plates increasing as the animal advances in age; an interesting point of resemblance to the dentition of the elephant, and a link of connection between the rodents and the pachydermata. The C. feeds exclusively on vegetable food, browsing on the grass near the rivers, and often committing great ravages in plantations of sugar-cane. It runs badly, but swims and dives well, and has the power of remaining under water for seven or eight minutes. It is very inoffensive, and easily tamed. The flesh, except that of old males, is good, and is eaten by all classes of persons. The C. is sometimes called Water-hog, of which *Hydrocherus* is a Greek translation. In Demerara, it is called Water-horse, a corruption of the Dutch *Water Haas*—i. e., water-hare.

CARA'BIDÆ, a tribe of beetles, or coleopterous insects, of the section *Pentameria* (see COLEOPTERA), corresponding with the genus *Carabus* of Linnaeus, but of which the species are extremely numerous, those already known being numbered by thousands. They mostly feed on other insects, worms, &c., and are extremely voracious and active, habits which are fully shared by their larvae. Some of them burrow in the earth; most of them live under stones, under the bark of trees, among moss, &c.; and their bodies are adapted to this mode of life, being very firm and hard. Their legs are in general

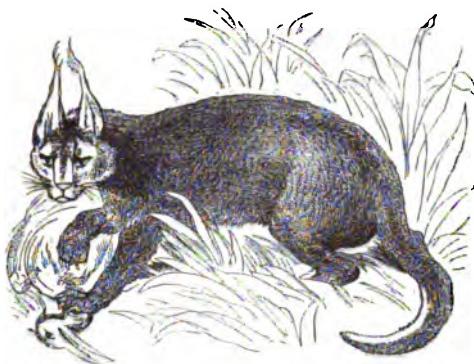

Mormolyce phyllodes.

pretty long, and most of them pursue their prey rather by the use of their legs than of their wings, some of them indeed being wingless, or having only rudimentary wings. Many of them exhibit much beauty of colours and metallic lustre. The largest British species is only about an inch long, but some foreign ones are much larger. Some of the species of the restricted genus *Carabus* are among the most common British insects. Their wings are not fitted for flight.—A very large and singular insect of the tribe C. is *Mormolyce phyllodes*, a native of Java, which, in consequence of the extremely depressed form of its body, resembles some of the *Mantidae* (q. v.), and the insects known as Leaf-insects (q. v.). To this tribe belong also the Bombardier Beetles (q. v.).

CA'RABOU. See REINDEER.

CA'RACAL (*Felis Caracal*), a species of *Lynx* (q. v.), found in the warmer parts of Asia, and throughout the whole of Africa; and more probably than any European species, the lynx of the ancients. It is larger than a fox, about the same height, but much more powerful; of a uniform deep brown or wine-red colour, except two spots near each eye, the under parts of the body, and inner

parts of the legs, which are white, and tufts of long black hair which terminate the ears. The C. is powerful enough to tear a hound to pieces. It is often represented as of a very savage disposition;

Caracal (*Felis Caracal*).

but it is capable of being tamed, and has been employed in hunting.

CARACALLA, properly named MARCUS AURELIUS ANTONINUS BASSIANUS, a Roman emperor, the son of the Emperor Septimius Severus, was born at Lyon, 188 A.D. He was playfully named by his father Caracalla, from his long hooded tunic, made in the fashion of the Gauls, and so called in their language. After his father's death, 211 A.D., he ascended the throne as co-regent with his brother Publius Septimius Geta, whom he afterwards caused to be murdered. Having bribed (at enormous cost) the Praetorians to overlook this foul deed, and to make him sole emperor, C. next directed his cruelty against all the friends and adherents of Geta, of whom twenty thousand of both sexes—including the great jurist Papinianus—were put to death. Innumerable acts of oppression and robbery were employed to raise supplies for the unbounded extravagance of the despot, and to pay his soldiers. In his famous constitution, he bestowed Roman citizenship on all his free subjects—not citizens—who formed the majority, especially in the provinces—but simply in order to levy a greater amount of taxes on releases and heritages, which were paid only by citizens. In his campaigns, he imitated, at one time, Alexander, at another time, Sulla; while his main object was to oppress and exhaust the provinces which had been in a great measure spared by the tyranny of former emperors. In 217 he was assassinated, at the instigation of Macrinus, prefect of the Praetorians, by one of his veterans named Martialis, on the 8th of April 217, on the way from Edessa to Carrhae. Historians paint the life of C. in the darkest colours. Among the buildings of C. in Rome, the baths—Thermae Caracallæ—near Porta Capena were most celebrated, and their ruins are still magnificent.

CARACARA, or CARACARA EAGLE (*Polyborus*), a genus of birds of prey peculiar to America, and regarded as a connecting-link between eagles and vultures; agreeing with the former in their strongly hooked bill and claws, but with the latter in their naked face and propensity to prey on carrion. The name C. is originally Brazilian, and is derived from the peculiar hoarse cry of a common Brazilian species (*P. Brasiliensis*), a bird of very fine plumage, and about 50 inches in expanse of wings, which is

of frequent occurrence over a large extent of the American continent, and is sometimes to be seen even in the southern parts of the United States.

Caracara (*Polyborus Brasiliensis*).

CARA'CAS the capital of the republic of Venezuela, the most northerly state in South America, with Guiana on the E., and New Granada on the W., is situated in lat. 10° 30' N., and long. 67° 5' W., 16 miles to the south of La Guayra, its port on the Caribbean Sea. It is 2880 feet above the tide-level, enjoying from this elevation a healthy air and a temperature so moderate as to average 68° and 72° F. in February and June respectively. Standing immediately above the confluence of four streams, it is well supplied with cool water, which is distributed by means of fountains, pipes, and reservoirs. The neighbourhood is subject to earthquakes—12,000 citizens having, in 1812, perished from this cause. The population in 1873 amounted to 48,897. The streets are straight and regular. The most splendid edifice in the city is the Church of Alta Gracia for the people of colour, excelling even the cathedral in the richness of its decorations.

CARA'CAS, the province of which the foregoing city is the capital, extends in N. lat. from 7° 38' to 10° 46', and in W. long. from 65° 30' to 68°, and contains 363,858 inhabitants. With a generally mountainous interior, the immediate coast is flat, presenting, besides La Guayra above mentioned, several harbours or roadsteads. The exports of the province are cocoa, coffee, dye-woods, hides, indigo, and sarsaparilla.

CARA'COI, a celebrated family of Italian painters, the founders of the Bolognese school of painting.

CARACCI, LUDOVICO, the son of a butcher, was born at Bologna, 1555. As a student, he was so inapt that his master recommended him to abandon the pursuit; but instead of that, he went to Venice and Parma, making acquaintance with the works of the great masters there, and returned to Bologna imbued with art principles quite opposed to the superficial mannerism then prevailing in his native city. In conjunction with two of his cousins, who, instructed by him, had imbibed the same ideas, he founded, in spite of great opposition, the school which afterwards became so famous in the history of painting. The first principle of this new school was, that 'observation of nature ought to be combined with imitation of the best masters.' The allied artists found numerous pupils, to whom they gave practical instructions in drawing from natural and artistic models, with theoretical lessons on perspective, anatomy, &c. So great was their success,

that, in the course of a short time, all other schools of painting were closed in Bologna. Some of the finest works of this master are preserved in the *Accademia delle Belle Arti*, Bologna—among others, the ‘Madonna and Child Throned,’ ‘Madonna and Child Standing,’ the ‘Transfiguration,’ and the ‘Nativity of St John the Baptist.’ Ludovico died in 1619.

CARACCI, AGOSTINO, cousin of Ludovico, was born (1558) in Bologna. He became a disciple of his cousin, but he was of too versatile a genius to devote himself closely to any subject, though his magnificent painting of the ‘Communion of St Jerome’ proves that he might have attained to very great eminence, had he devoted his undivided attention to the art; but he was in the habit of abandoning his easel for literature, poetry, and engraving on copper. As an engraver, indeed, he holds an important position in Italian art. He accompanied his younger brother, Annibale, to Rome, and there assisted in some of the paintings in the Farnese Gallery; but his brother, who was a slave to his art, soon quarrelled with him for his inattention, and he left Rome, and went to Parma. He died in 1602.

CARACCI, ANNIBALE, brother of Agostino, was born (1560) in Bologna, where he learned, under his father, the business of a tailor, from which he was called away by Ludovico Caracci. His progress in the study of painting was rapid, and at first he took principally for his models Correggio, Titian, and Paul Veronese. His picture of ‘St Roch distributing Alms’ first gained for Annibale C. a wide reputation. His fame reached Rome, and he was employed to paint the Farnese Gallery there, which is considered his greatest work, and the manner of which partakes somewhat of Raphael and Correggio. On this gallery he was employed some eight years, and he received for his work the incredibly paltry sum of 500 crowns. In disgust and vexation, the artist threw aside his pallet. He died in Rome in 1609, where his remains were interred, close to Raphael’s tomb, in the Pantheon. Annibale C. was one of the greatest followers of Correggio, and in composition approached most nearly to the style of Raphael. Ludovico had a greater talent in teaching, and Agostino had a more versatile invention, but Annibale was unquestionably the greatest artist of the three Caracci.

CARACCI, ANTONIO, natural son of Agostino, was born at Venice 1583, died in 1618. He was a pupil under Annibale, and painted some excellent pictures.

CARACCI, FRANCESCO (styled FRANCESCHINI), brother of Agostino and Annibale, was born in 1595, and distinguished himself as an eminent designer. He died 1622.—The best Italian masters of the 17th c.—Domenichino, Guido Reni, Albani, and others—proceeded from the school of the Caracci.

CARACCI’OLI. The name of a Neapolitan family unfortunately associated with the memory of Lord Nelson. Several members of this family were employed in political offices.—LOUIS ANTOINE DE C., born in Paris 1721, died 1803, was the author of a pseudograph, entitled *Lettres Intéressantes du Pape Clément XIV.*, which mystified many readers throughout Europe.—FRANCESCO C., a meritorious Neapolitan admiral, entered in early life the marine service, and distinguished himself at Toulon, 1793. In the year 1798, the offensive conduct of the court of Naples toward C. induced him to return from Palermo, where the court was then residing, to Naples, where he entered into the service of the republic established by the French invaders, and, with a few vessels, prevented the attempted landing of a Sicilian and British fleet. In 1799, when Ruffo took Naples, C. was arrested, contrary to the

terms of capitulation, sentenced to death by the junta, hanged on the mast of a frigate, and his corpse thrown into the sea. This affair, to which Lord Nelson was a consenting party, is a stain on the reputation of the English admiral.

CARA’CTACUS, a king of the Silures, who inhabited South Wales, was one of the most persistent enemies of the Romans in Britain. For nine years he warred gallantly against the invaders, but at length was completely overthrown. His wife and daughters fell into the hands of the victors, and his brothers surrendered. C. himself fled to Cartimandua, queen of the Brigantes, who delivered him up to the Romans. He was carried to Rome, 51 A.D., and exhibited to the people by the Emperor Claudius. When he approached the imperial seat, we are told, he addressed Claudius in so noble a manner, that he and his relatives were immediately pardoned. They appear, however, to have lived during the remainder of their lives in Italy.

CARADOC SANDSTONE AND BALA BEDS, a division of the Lower Silurian System, so named from their development at Caer Caradoc, in Shropshire. They consist of sandstones, grits, and slates, with occasional beds of limestone. Enormous masses of contemporaneous igneous rocks are interstratified with them. They attain a thickness of 9000 feet, not including the igneous rocks. Fossils are very abundant in some beds. They consist chiefly of Trilobites (q. v.), Brachiopoda (q. v.), and Graptolites (q. v.).

The Silurian rocks in the southern districts of Ayrshire belong to this division.

CARA’GLIO, a town of Northern Italy, in the province of Coni, six miles west of the city of that name. It is situated on the Grana, and has manufactures of silk. Pop. 6268.

CARAMANIA. See KARAMAN.

CARA’MBOLA, an East Indian fruit, of the size and shape of a duck’s egg, but with five acute angles, or longitudinal ribs. It has a yellow, thin, smooth rind, and a clear watery pulp, in some varieties sweet, in others acid, of very agreeable flavour. It is often used in making sherbets, and in tarts and preserves; and is known to the British in India as the *Coromandel Gooseberry*. It is one of the most universally cultivated and abundant of the fruits of India. It is produced by the *Avicchia Carambola*, a small evergreen tree, or bush, of the natural order *Oxalidaceæ*. The BILIMBI, or BLIMBING, is the very acid fruit of another species of the same genus, *A. Bilimbi*, also East Indian. Both species are now much cultivated in the tropical parts of America. Both exhibit an irritability of leaf resembling that of the sensitive plant; they also display in a remarkable degree the phenomena known to physiologists as those of Sleep (q. v.) in plants.

CARAMEL is the name applied to the dark brown and nearly tasteless substance produced on the application of heat to sugar (q. v.). It is likewise formed during the roasting of all materials containing sugar, such as coffee, chicory, and malt (see BREW), and is one cause of the dark colour of porter and infusions of coffee. It is also employed in the colouring of whisky, wines, vinegar, &c.

CARAMNA’SSA, a river in the presidency of Bengal, which rises in lat. 24° 34' N., and long. 83° 46' E., and, after a course of about 150 miles, enters the Ganges from the right in lat. 25° 28' N., and long. 83° 58' E. It is remarkable on several grounds. Though, on issuing from its

source, it is clear as crystal, it is yet said to be both nauseous and noxious—a peculiarity which the natives impute to various supernatural causes; about 50 miles from its mouth, it is crossed by a stone bridge of three wide arches, which forms part of the grand road from Calcutta to Delhi; and lastly, it is so exceptionally subject to floods, that it has been known to rise 25 feet in a night, when scarcely any rain had fallen in the adjacent plain of the Ganges itself.

CARANA RESIN, more commonly, but less correctly, called GUM CARANA, is a resinous substance imported from the tropical parts of America. Its properties and uses resemble those of taca-mahac. It is entirely soluble in alcohol, and melts in a slight heat. It is not well known what tree produces it.

CARANJA, an island on the east side of the ordinary entrance of the harbour of Bombay (q. v.), separated from the mainland by a narrow and unserviceable channel of four miles in length. It is itself two miles broad, being comparatively level and fertile, with the exception of two hills—the Little Hill in the north, and the Great in the south.

CARANX. See SCAD.

CARAPA, a genus of plants of the natural order Meliaceæ, natives of warm climates. *C. Guianensis*, or *guareoides*, sometimes called the Anderaba, also the C. tree, is a large tree with beautiful shining pinnate leaves, which have many leaflets, a native of Guiana and the adjacent countries, where its bark has a great reputation as a febrifuge, and the oil obtained from its seeds is much used for lamps. Masts of ships are made of its trunk. The oil, which is called Oil of Carapa, is thick and bitter, and is anthelmintic.—*C. Tououcouna*, or *Guineensis*, an African species, yields a similar oil, which is employed by the negroes for making soap, and for anointing their bodies, its bitterness protecting them from the bites of insects, a purpose to which the Oil of C. is also applied in South America.—These species are very similar, and are supposed by some botanists not to be essentially distinct.

CA'RAPACE, the dorsal shield or buckler of chelonian reptiles (Tortoises and Turtles), and of the Crustacea *Malacostraca* (Crabs, Lobsters, &c.). In animals so widely different, however, there is only a general similarity in the appearance of the C., and the purpose which it serves; its organic relations are very different. For notice of these, we refer to the articles CHILONTA and CRUSTACEA.

CA'RAT, originally, it would seem, the name given to the seeds of the Abyssinian Coral Flower (q. v.) or Coral-tree (*Erythrina Abyssinica*); but these, which are small, and very equal in size, having been used in weighing gold and precious stones, C. has become the designation of the weight commonly used for weighing precious stones, and particularly diamonds. The seeds of the Carob (q. v.) tree have also been said to be the original C. weights of jewellers, but with less probability.

Goldsmiths and assayers divide the troy pound, ounce, or any other weight, into 24 parts, and call each a C., as a means of stating the proportion of pure gold contained in any alloy of gold with other metals. Thus, the gold of our coinage and of wedding-rings, which contains  $\frac{1}{2}$  of pure gold, is called '22 carat fine,' or 22 C. gold. The lower standard used for watch-cases, &c., which contains  $\frac{1}{2}$  of pure gold, is called 18 C., and so on. The C. used in this sense has therefore no absolute weight; it merely denotes a ratio. This, however, is not the case with the C. used for weighing diamonds, which has a fixed weight, equal to  $\frac{1}{4}$  troy grains, and is

divided into quarters, or 'C. grains' eightths, sixteenths, thirty-second, and sixty-fourths. These C. grains are thus less than troy grains, and therefore the jeweller has to keep a separate set of diamond weights.

CARAVA'CA, a town of Spain, in the province of Murcia, about 39 miles north-west of the city of that name, is situated on the slope of a hill crowned with a fine old castle. Its principal streets are wide, clean, and well paved; it has a fine church, with a miraculous cross, that is annually taken down and bathed in the waters of the town, to which it is supposed to communicate sanitary properties. It has manufactures of linen and woollen fabrics, soap, paper, leather, &c. Pop. about 10,000.

CARAVA'GGIO, a town of Lombardy, Northern Italy, about 24 miles east of Milan. In the principal church are some esteemed paintings by Campi; and C. is also celebrated as the birthplace of the painters, Polidoro Caldara and Michael Angelo Merighi, both surnamed Caravaggio. In the neighbourhood is a sanctuary of the Madonna, built from designs of Pellegrini (1575). Pop. about 6000.

CARAVA'GGIO, MICHAEL ANGELO AMERIGHI or MERIGHI DA, a celebrated Italian painter, was born 1569, at Caravaggio in Lombardy, Northern Italy. His father, who was a mason, employed him in making paste for the fresco-painters, and in this way the artistic genius of the boy was stirred. After studying the works of the great masters in Milan and Venice, he went to Rome, where he lived for some time in very reduced circumstances. At length, a picture of his attracted the notice of Cardinal del Monte, who now patronised the young artist; but the ferocious and quarrelsome character of C. soon involved him in difficulties. Having fled from Rome to Malta, on account of manslaughter, he obtained the favour of the grand-master by painting an altar-piece in the church of St John, and other pictures. His quarrelsome nature soon forced him to flee from Malta; and in making his way back to Rome, he was wounded, lost all his baggage, caught a violent fever, and on reaching Porto Ercole lay down on a bank and died (1609), at the age of 40. Truth to nature was the object aimed at by C., who left all schools, and devoted himself to paint life as he found it in lanes, alleys, and other resorts of the lower classes. He studied no such matters as refined sentiment or elevation of realities, but gave in his paintings expression to his own wild and gloomy character. One of his best paintings, 'The Fraudulent Gamblers,' is preserved in the Sciarra Gallery, at Rome. His shadows are deep, his backgrounds very obscure; in consequence of which the whole picture seems to possess a kind of mysterious greatness, that is very imposing. Even Rubens confessed that C. was his superior in chiaro-oscuro. When he painted on sacred subjects, he remained falsely faithful to the low realities of Italian life; so that several of his pictures painted for churches, had to be removed from their places, because they could not be harmonised with sacred associations. Kugler, the German critic, has justly said of one of C.'s most celebrated works, a 'Burial of Christ,' that it appears 'like nothing better than the funeral of a gipsy-chieftain.'—An earlier Italian painter of less eminence, POLIDORO CALDARA DA CARAVAGGIO, was born in 1495, and murdered in 1543.

CA'RAVAN (from the Persian *kawan*, i. e., trader), the name given to the great assemblages of travellers which, at stated times, traverse the deserts of Asia and Africa. Many caravans are entirely for the purposes of trade, the merchants associating themselves for mutual help and protection. A C.

## CARAVANCES—CARBAZOTIC ACID.

sometimes has so many as 1000 camels, which follow each other in single file, so that it may be a mile or more in length. The most celebrated caravans are those formed by pilgrims going to Mecca, particularly those which annually assemble at Cairo and at Damascus. The latter consists of 30,000 to 50,000 pilgrims, and is under the special protection of the Turkish sultan. The caravan by which the Persians travel to Mecca starts from Bagdad, and is the vehicle of a very important trade. The great Indian caravan to Mecca, which started from Muscat, has been long given up. Mecca, upon the arrival of the caravans, bringing goods from so many different parts of the world, presents all the appearance of a vast fair. The trade between Tripoli and the interior of Africa is exclusively carried on by caravans, likewise that between Darfur and Egypt. The great trade between Russia and China is also a caravan trade. In the East, caravans in which the camels have a load of 500 to 600 pounds are called *heavy caravans*; *light caravans* are those in which the camels have only half that weight, so that the daily journeys may be longer. *Heavy* caravans travel from 17 to 18 miles a day; *light*, from 22 to 25. The caravans are generally conducted with great regularity, and assemble at and start from stated places on stated days. The leader of the Mecca-caravans is called Emir-el-Hadsch, i. e., Prince of the Pilgrims. In trade-caravans, a leader, who is called Karwan-Baschi, is elected by the merchants from their own number.

Among the knights of Malta, caravans meant the troops of knights appointed by the order to serve in garrisons, and also the cruises of their galleys against the Turks.

**CARAVANCES.** See CHICK PEAS.

**CARAVA'NSARAI**, or KHAN, an eastern institution, a sort of unfurnished inn to provide travellers with a shelter. Those in towns and cities, which are generally built for traders, and charged a small sum a day, are handsomer and more convenient—having doors to the apartments—than those met with on the roads or outside the walls of the cities. They commonly consist of a square building of four wings built round a courtyard, in which the beasts of burden may be enclosed, and where there is usually a well of water; the lodgings are small rooms, about 7 or 8 feet high, which run round the courtyard, and are bare of every article of furniture.

These caravanserais are an institution of very ancient date, being the ‘inns’ of Gen. xlvi. 27, xliii. 21; and it was in the stable of such a place, there being no room for his parents in the lodging apartments, that our Saviour was born (Luke ii. 7). They belong either to government, to some private individual, or are the property of the church (mosques); those situated in towns or cities are charged, but not more than two or three Turkish piastres a day; those situated on the road are usually free. There are some large and very handsome caravanserais at Cairo, Damascus, Beyroot, Aleppo, &c. The steward or keeper of a C. is called a *caravanserakier*.

**CA'RAWAY** (*Carum carvi*), a plant of the natural order *Umbellifera*, growing abundantly in meadows and rich pastures in the middle and south of Europe, and in some parts of Asia, naturalised in many places in Britain. In some parts of Holland and Germany, and also in the counties of Kent and Essex in England, it is extensively cultivated for its aromatic seeds—in more strict botanical language, carpels—which are used medicinally as a carminative and tonic, and are also very much used as an aromatic condiment, and by confectioners, distillers,

and perfumers, entering into the preparation of liqueurs, cakes, sweetmeats, scented soaps, &c. They depend for their aromatic properties on a volatile oil called Oil of C., which is obtained by bruising C. seeds, and distilling them with water, and is at first limpid and colourless, but becomes yellow, and subsequently brown by keeping. Oil of C. is used medicinally to relieve flatulence, and to correct the nauseating and gripping tendencies of some cathartic medicines; also in the preparation of *Spirit of C.*, and *C. Water*.—*Spirit of C.*, which may be prepared either by dissolving the oil of C. in proof-spirit, or by distilling bruised C. seeds along with proof-spirit, is much used in Russia and Germany as a liqueur (*Kümmel-branntwein*), sweetened with sugar.—C. has a branching stem 1—2 feet high, with finely divided leaves, and dense umbels of whitish flowers. The fruit is oblong, each carpel having five thread-like ribs, with a single *vitta* (see *UMBELLIFERAE*) in each of the interstices. The white carrot-shaped root of C. is sometimes used like carrots or parsnips, but has a very strong flavour.—C. has a great

Caraway.

enemy in the CARAWAY MOTH (*Hemylis daucella*), the larva of which destroys both its stem and flowers.’

**CARBAZO'TIC ACID**, or **PICRIC ACID**, is a substance of great importance in dyeing, which is obtained by the action of strong nitric acid and heat on many complex organic materials, such as silk, indigo, salicine, and a variety of resins. On a commercial scale, it is best obtained from the oil of tar, which distils over from crude tar between 300° and 400°, or from the resin of *Xanthorrhoea hastilis*. The hot nitric acid solution is strained from impurities, and on cooling, yellow crystals separate of C. A., which can be purified by washing with cold water. These crystals are readily soluble in alcohol and ether, and dissolve in 80 or 90 times their weight of cold water, yielding a yellow solution, which has a very bitter taste, and stains the skin yellow; and when silk which has been treated with a mordant of alum, or cream of tartar, is immersed in a solution of C. A., it is dyed of a beautiful permanent yellow colour. The bitter taste of C. A. has led to its being fraudulently employed,

## CARBINE—CARBON.

instead of hope, in communicating a bitter taste to beer.

**CARBINE** is a light kind of musket, named probably from the Carabina. See next article. It is now used by the cavalry, the yeomanry cavalry, the Irish constabulary, and other corps. The best carbines are now rifled. A considerable number of American carbines, rifled and breech-loading, were purchased at a high price by the English government in 1856. This American C. has a barrel only 22 inches in length, and a total weight of  $7\frac{1}{2}$  lbs. It is simple in construction, has a great range, hits a mark with accuracy, may be fired with rapidity, requires little cleaning, can be loaded without a ramrod, and supplies itself with caps from a reservoir in the hammer. Among English makers, Mr Prince has successfully applied the breech-loading principle to carbines. The Victoria Cavalry C. has a barrel 26 inches long, with 0·733 inch bore; its weight is  $7\frac{1}{2}$  lbs., and it is fired with 2½ drachms of powder.

**CARBINEERS**, or CARABINEERS, are said to have derived their designation from the Arabs, among whom the *Carabine* or *Karabine* were light horsemen, stationed at outposts to harass the enemy, defend narrow passes, &c.; in action, they took the place of skirmishers. A corps under the same name was raised in France in 1560; but the designation has not been much used in that country since the introduction of Hussars and Lancers. In the English army, C. was at one time a frequent designation for cavalry; but now there is only one regiment, the 6th Dragoon Guards, known by this title; and the distinction between them and other cavalry is little more than nominal.

**CARBOHYDROGENS**, or HYDROCARBONS, are a series of compounds belonging to organic chemistry, which are composed of carbon and hydrogen, in such proportions that the various members of the group differ from each other in definite and regular numbers of atoms of carbon and hydrogen. The best marked group of hydrocarbons commences with Methylene ( $C_2H_2$ ), which may be regarded as the first step in the ladder, and by the successive addition of other two atoms of carbon and hydrogen, we obtain Ethylene or Olefiant Gas ( $C_2H_4$ ), Propylene ( $C_3H_6$ ), Butylene or Oil Gas ( $C_4H_8$ ), Amylene ( $C_5H_{10}$ ), &c. There are also series beginning with Methyl ( $C_3H_4$ ), then Ethyl ( $C_3H_5$ ), and with Hydride of Methyl or Marsh Gas ( $C_2H_4$ ), then Hydride of Ethyl ( $C_3H_6$ ). The members of these groups are likewise characterised by a gradual ascending difference in their chemical and physical properties, especially the boiling-point, which rises by a given amount.

**CARBO' LIC ACID**, or PHENIC ACID, ( $C_6H_5O$ ), is the principal acid substance procured during the distillation of coal-tar. It is produced also by the distillation of gum benzoin and the resin of *Xanthorrhœa hastata*, and is present in the urine of the cow and some other animals. It crystallises at ordinary temperatures in colourless needles. It smells like tar or creasote, and has a hot taste. It is a powerful antiseptic, and quickly arrests all putrefactive and fermentive changes. Hence it is used, freely diluted in water, as a dressing in the antiseptic system of treating wounds, first practised by Mr Lister, Professor of Clinical Surgery in Edinburgh University. It is also used for purifying or rendering inoffensive the Sewerage (q. v.), &c.

**CARBON** is one of the elementary substances largely diffused in nature. It occurs uncombined in the mineral graphite or black-lead (q. v.), and in the diamond (q. v.), which is pure crystallised

carbon. It is much more abundant, however, in a state of combination. United with oxygen, it occurs as carbonic acid ( $CO_2$ ) (q. v.) in the atmosphere, in natural waters, in limestone, dolomite, and iron-stone. In coal, it is found combined with hydrogen and oxygen; and in plants and animals, it occurs as one of the elements building up wood, starch, gum, sugar, oil, bone (gelatine), and flesh (fibrine). Indeed, there is no other element which is so characteristic of plant and animal organisms, and it ranks as the only element never absent in substances obtained from the two kingdoms of organic nature. Wood-charcoal, coke, lampblack, and animal charcoal, are artificial varieties, more or less impure, of carbon.

The atomic weight or equivalent of C. is 6; the specific gravity greatly varies; that of the diamond is 3·330 to 3·550 (water being 1·000), and of graphite 1·800. C., in its ordinary forms, is a good conductor of electricity; in the form of diamond, it is a non-conductor. Of heat, the lighter varieties of C., such as wood-charcoal, are very bad conductors; graphite in mass has very considerable conducting powers. At ordinary temperatures, all the varieties of C. are extremely unalterable; so much so, that it is customary to char the ends of piles of wood which are to be driven into the ground, so as by this coating of non-decaying C. to preserve the interior wood; and with a similar object, the interior of casks and other wooden vessels intended to hold water during sea-voyages, are charred (coated with C.), to keep the wood from passing into decay, and thereby to preserve the water sweet. Its power of arresting odours and colours likewise varies much. See **BONE-BLACK**. In the simple property, even of combustion, there is a marked difference. Wood-charcoal takes fire with the greatest readiness, bone-black less so; then follow in order of difficulty of combustion—coke, anthracite, lampblack, black-lead, and the diamond. Indeed, black-lead is so non-combustible, that crucibles to withstand very high heats for prolonged periods without breakage or burning, are made of black-lead; and the diamond (q. v.) completely resists all ordinary modes of setting fire to it. In the property of hardness, how soft and velvet-like does lampblack feel to the touch, and yet how hard is that diamond which cuts glass, and is the hardest of all gems, and indeed of all things!

**Carbon for electrical purposes.**—When C. is obtained of sufficient density, it is found to be a good conductor of electricity, and to make an excellent electro-negative element in a galvanic pair. Graphite displays these qualities to advantage, and so does the hard incrustation of C. that is found sublimed in gas retorts. Coke and wood-charcoal are too porous to possess them to any great extent. The scarcity of graphite, and the precarious supply of retort-C., preclude the possibility of obtaining much practical advantage from the electrical properties of C. with these substances alone. We are indebted, however, to Professor Bunsen of Heidelberg for the discovery of a process whereby a C. of the requisite density can be manufactured with great ease and economy. The carbons thus obtained for galvanic batteries rival platinum in electric energy, and they have aided in no small degree, from their cheapness, in heightening the utility of galvanic electricity. The Bunsen carbons, as manufactured in Germany, are of the form of hollow cylinders, whereas those made in France and this country are solid rectangular prisms. The following are the more important details of the process. Two parts of coke, and one of baking coal—the proportion varying to some extent with the materials—are ground to a fine powder, and passed

## CARBONARI—CARBONIC ACID.

through a sieve. The powder so got is transferred to iron-plate moulds of the required shape, the seams of which are merely clasped together, and luted with clay. No pressure is employed in filling them, other than that of shaking. When the moulds are filled, they are placed in a furnace, and kept there till all carburetted hydrogen has escaped from them. They are then taken out, and allowed to cool before the mass within is removed, which is now found to have taken a solid form, and to be so hard that it may be turned or ground to the exact size wanted. At this stage, the carbons are destitute of electrical action, and they must consequently be rendered more dense by a subsequent process. This consists in soaking them thoroughly in thick sirup, or, better still, in gas-tar thickened by boiling, and laying them aside till dry, after which they are packed with charcoal-dust in fire-proof crucibles, and exposed for a considerable time to a high heat. If one soaking and charring is not enough, the same may be repeated until sufficient density is obtained. Throughout the process, it is essential that all flaming matters be driven off, so as to leave only the C. in the mould; and care must be taken that no air be admitted to the mould when under the action of heat, otherwise there would be a loss of C. from combustion. The manufacture of these carbons may be carried on contemporaneously with that of gas. The sticks of C. used for the electric light are obtained by sawing up either C. made by this process or the C. of the gas retorts.

**CARBONARI** (literally, 'colliers' or 'charcoal-burners'), the name of a secret political society, first, in some degree, made known in 1820. The constitution, like the precise objects of the C., still remains in a great measure secret; though they have printed instructions, catechisms, statutes, rituals, &c., for their associates. The statements respecting the high antiquity of this secret confederacy are quite fabulous. There is every reason to believe that it originated during the last French régime in Naples. Botta, in his *Storia d'Italia*, states that, under Murat's government, the Neapolitan republicans, equally hating the French and King Ferdinand, escaped into the wild defiles of the Abruzzi, and here, naming themselves 'C.', formed a secret society. It is said that their leader, Capobianco, had great powers of popular eloquence, and that their motto or war-cry was, 'Vengeance for the lamb torn by the wolf!'

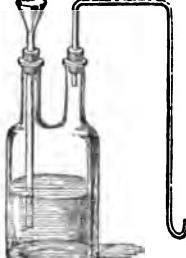

The peculiar phraseology of the C. is taken from the vocation of charcoal-burners. For instance, they are (or were) wont to speak of 'clearing the forest of wolves.' The 'wolves' probably meant at first foreign tyrants; but in the course of time, after the restoration of the Neapolitan Bourbons, such symbolical expressions had reference to their desppicable misrule. Among themselves, the initiated were styled 'good cousins.' The various societies do not seem to have possessed a common centre, or to have been properly organised for combined action. A place of meeting was styled 'a hut' (*baracca*), the external neighbourhood, 'the forest'; and the interior of the hut was the *rendita* or 'place for selling coal.' A union of several of these huts formed a 'republic.' The superior huts (*alte rendite*) at Naples and Salerno endeavoured, but without success, to effect a centralisation of the Carbonari. The society, soon after its institution, numbered 24,000—30,000 adherents, and increased so rapidly in Italy that, in March 1820, it is said as many as 650,000 new members were initiated, including considerable numbers of the military and the clergy. The religious and Protestant character of the order is expressed in its statutes, which include the article: 'That every Carbonaro has the natural

and unalterable right of worshipping God according to his own convictions.' Though Carbonarism did not arise from the lodges of freemasons (as several have supposed), it has borrowed many forms of masonry.

After the restoration of the Bourbons, several secret political unions were formed in France, and in 1820 were confederated with the Carbonari. Paris, after the prosecutions against the secret societies of Italy, was made the head-quarters of a Carbonarism which, adopting all the symbolic phraseology, rules, and regulations of the Italian societies, received from the rapidly systematising genius of the French, an organic character which it had never before possessed. The initiated styled themselves *bons cousins*, and spoke of the uninitiated as *paganis* (heathens). Written documents and communications were strictly prohibited by the heads of the union, and treachery was to be punished by assassination. After the close of the French and Spanish war, the C., whose activity in contriving plots had excited the terror of the French prefects, restricted its endeavours to the circulation of republican ideas, without direct attempts towards insurrection. After the July revolution, several of the leading French C. attached themselves to the new régime, and their society was gradually dissolved. In its place the new *Charbonnerie Démocratique* was founded, having for its object the establishment of a republican government, founded on the principles of Babeuf (q.v.). The endeavour of these new C. to make Paris the centre of all political movements, led to the secession of the Italian refugees, who associated themselves under the title 'Young Italy.' French Carbonarism is not known to exist at present, and it is possible that even in Italy the triumphs of constitutional patriotism during recent times have rendered its existence no longer necessary, but it certainly was alive at the commencement of the Franco-Sardinian war with Austria; and one of the rumours of the time was, that the French Emperor—who, in his young republican days, had been a member of this society—had entered on the war of liberation, to conciliate his old associates, who had menaced him with the fate of a traitor.

**CARBONATED** or **ACIDULOUS**. WATERS are those which contain a great excess of carbonic acid gas. The amount of gas in ordinary spring and well waters does not amount to more than 3—8 cubic inches in 100 cubic inches of the water; but in waters entitled to be called C., the proportion of gas to 100 cubic inches of water rises 30—60, when they are considered rich; 100—200, when they are very rich; and in the waters of St Nectaire it is said that the proportion of gas is as high as 400 volumes to 100 of the water. These waters sparkle much when poured from one vessel to another. The carbonic acid is free, but is generally accompanied (1) by bi-carbonate of soda, when the water is called *carbonated-alkaline* or *acidulo-alkaline*, as in the Seltzer, Pyrmont, Salzbrunn, Altwasser, and Reinerz acidulous mineral springs; or (2) by carbonate of iron, when the water is named *carbonated* or *acidulous chalybeate*. See **CHALYBEATE** WATERS. The mineral spring at Irkeston, near Nottingham, is the only water of this nature in Britain. The C. or A. W. are very refreshing and exhilarating, and are useful in certain disordered states of the stomach; they relieve nausea, and generally increase the discharge of liquid from the system. They are objectionable in the case of persons of a full and inflammatory state of body.

**CARBO/NIC ACID, FIXED AIR, or CHOKE-DAMP,** is a substance occurring free as a gas in

vescence, and may be conducted by a proper tube under the mouths of jars filled with water and placed on a pneumatic trough. Where C. A. is required in large quantities, it is prepared in a leaden vessel from chalk ( $\text{CaO}, \text{CO}_2$ ) and sulphuric acid ( $\text{SO}_4$ ) diluted with water, when sulphate of lime ( $\text{CaO}, \text{SO}_4$ ) is formed, and C. A. escapes as gas.

The atomic weight or equivalent of C. A. is 22; it is a clear, colourless gas, with a pleasant, acidulous smell and taste. Under great pressure and cold, it can be condensed into a liquid, and even a solid resembling snow in appearance. Under ordinary atmospheric pressure, C. A. dissolves in water to the extent of 2 volumes of gas in 3 of water; but under increased pressure, a very much larger amount of gas is taken up by the water, and in this way the various kinds of AERATED WATERS (q. v.) are prepared. The gas is more than half as heavy again as ordinary air, being 1529. It is incombustible, and a non-supporter of combustion, at once extinguishing a lighted candle, gas jet, or even a piece of burning phosphorus, when these are placed in a jar filled with the gas, or even in a mixture of C. A. and air. This power of putting out flame and fire has been turned to account in the extinguishing of burning coal-mines, where, all the openings to the mine being properly secured, C. A., in the form of the spent air from an ordinary coal-furnace, has been passed into the mine, with the result of successfully stopping the fire. It is irrespirable in a concentrated form, producing spasm of the glottis, which prevents the admission of the gas into the system; and when mixed with air, it can be breathed without suspicion, and then acts as a narcotic poison, even when present only to the extent of 4 or 5 per cent. of the air. The deadly effects of C. A. are observed, in the combustion of charcoal, coal, or coal-gas, in chauffers, furnaces, or in fireplaces with the dampers down, when the deadly fumes of C. A. steal more or less quickly over the inmates of the room, and they almost unconsciously become its victims—thus unknowingly following the course of the Parisian suicide, who purposely lights a charcoal fire in the centre of his room, and prepares for death; and in overcrowded rooms where the C. A., exhaled from the lungs of each inmate at every breath, poisons the air of the apartment, and day by day slowly but surely robs the robust of health, and ultimately of life. In such cases as the Black Hole of Calcutta (q. v.), where there was scarcely any outlet for the poisonous gas, only a few hours may be required to complete the catastrophe.

Though poisonous when inhaled by the lungs, C. A. is rather refreshing when taken into the stomach. Thus, aerated beverages of all kinds—beer, champagne, and carbonated mineral waters—owe their refreshing and invigorating qualities to the presence of C. A.; and if the gas be allowed to escape, they become almost tasteless, stale, and mawkish.

C. A. is largely evolved from fissures in the earth, especially in volcanic districts. In the *poison or Upas valley* of Java, which is a valley of an oval form, about  $\frac{1}{4}$  of a mile in circumference, and 30 to 35 feet deep, the carbonic rises to a height of about 18 feet from the surface, and the whole bottom of the valley is devoid of vegetable and animal life, and is strewn here and there with the bleached bones of man and other animals that have unluckily stepped within the deadly circle. A dog thrown in, dies in 14 seconds; and birds attempting to fly across the valley, instantly drop down dead. In the neighbourhood of the lake of Laach, in Rhemish Prussia, the amount of C. A. evolved every day has been estimated at 600,000 lbs. weight. In a state of combination, C. A. forms an ingredient in a great number of minerals called carbonates, such as chalk, limestone of various kinds ( $\text{CaO}, \text{CO}_3$ ), black-band iron-stone (carbonate of iron,  $\text{FeO}, \text{CO}_3$ ), malachite (carbonate of copper,  $\text{CuO}, \text{HO}, + \text{CuO}, \text{CO}_3$ ), &c. C. A. is the principal product of combustion; the carbon of the burning substance (coal, candle, coal-gas, wood, paper, &c.) uniting with the oxygen of the atmosphere, and forming C. A. ( $\text{CO}_2$ ). It is also a product of respiration (q. v.), and is evolved more or less largely by all animals, not only by the mouth, but in exhalations from the skin, and is present in blood, urine, &c. It is evolved during the fermentation (q. v.) of beer, wine, &c., and often remains in brewers' vats when the liquor has been drawn off. During the decay of vegetable and animal matters, C. A. is produced, and in explosions of fire-damp in coal mines, it is formed in large quantity, and fills the underground passagae.

C. A. forms the largest ingredient in the food of vegetables, and is therefore abstracted in large quantity from the air by planta. It enters into combination with the majority of the oxides of the metals and other compounds, to form a class of salts called carbonates, several of which have been referred to. C. A. when present in a vessel in quantity may be recognised by the power of extinguishing a lighted candle, or by not burning itself. C. A. in the form of gas may be readily recognised in the atmosphere by exposing a little lime-water in a saucer, or other shallow vessel, when the lime ( $\text{CaO}$ ) abstracting the C. A. ( $\text{CO}_2$ ) from the air, a white film of carbonate of lime or chalk ( $\text{CaO}, \text{CO}_3$ ) is formed on the surface of the liquid. A solution of Baryta (q. v.) in water is more delicate in its action on the C. A. of the air, and more readily indicates its presence.

**CARBONIC OXIDE** is a compound of one atom of carbon and one atom of oxygen, is represented by the symbol CO, and has the atomic weight 16. It does not occur naturally, but may be observed burning with a pale-blue flame in fireplaces and stoves, especially in frosty weather. During the combustion of the fuel at the lower part of the grate, the oxygen of the air unites with the carbon of the fuel to form carbonic acid ( $\text{CO}_2$ ); and this gas rising up through red-hot coal or carbon (C), has part of its oxygen abstracted by the carbon, and two atoms of carbonic oxide (CO) are produced, which taking fire on the top of the coals, burn with the characteristic blue flame, abstracting more oxygen from the air, and re-forming carbonic acid ( $\text{CO}_2$ ). C. O. can be prepared for experimental purposes by heating a mixture of oxalic acid ( $\text{H}_2\text{C}_2\text{O}_4$ ) and sulphuric acid ( $\text{SO}_4$ ) in a retort, when the latter abstracts the water from the oxalic acid, and the other elements ( $\text{C}_2\text{O}_4$ ) escape as carbonic acid ( $\text{CO}_2$ ), and C. O. (CO). On passing the mixed gases through a solution of potash ( $\text{KO}$ ), the carbonic acid is retained as carbonate of potash ( $\text{KOCO}_3$ ), whilst

## CARBONIC OXIDE—CARBONIFEROUS SYSTEM.

the C. O. remains as gas. C. O. is a transparent, colourless gas, a little lighter than air, being 967, and has never been liquefied nor solidified. It burns with a blue flame, but is a non-supporter of combustion, and at once extinguishes a lighted candle introduced into it. It is very poisonous, and even when largely diluted with air, if inhaled, it produces a sensation of oppression and tightness of the head, and ultimately acts as a narcotic poison. It does not take part in any natural phenomena, nor is it put to any use in the arts and manufactures, and in these respects, affords a striking contrast to carbonic acid, which has so many duties to perform in nature and in the arts.

**CARBONIFEROUS SYSTEM**, the name given to the strata which, in geological order, rest upon the Devonian measures, and are capped by the Permian series. They derive their designation from the amount of carbon contained in them, for to them the great coal-fields of the world belong. In an economic sense, they are the most valuable series of rocks in the earth's crust, forming the great storehouse from which is obtained the chief supply of coal, iron, and lime.

The rocks of the system are composed of a vast series of beds of sandstone, limestone, shale, and coal. In some coal-fields, these are so interstratified, that it is impossible to subdivide the strata in the order of time. In the Edinburgh district, there are nearly 100 coal-seams, omitting all under six inches in thickness. Out of the whole depth of the strata, amounting to about 6300 feet, these seams occupy only 204 feet. The remainder consists of sandstone and shale in the upper half; towards the middle, limestones appear, and these increase downwards in the number and thickness of the

beds, but are still intermixed with seams of coal. The same arrangement exists in the other coal-fields of Scotland, as well as in those of the north of England. In other districts, the limestone is confined to the lower portion of the measures, and separated from the coal-bearing strata, so as to form a natural subdivision of the system into—1. *The Coal Measures*, consisting of shale, sandstone, and grit, with occasional seams of coal; and 2. *The Mountain or Carboniferous Limestone*, a calcareous rock, containing marine shells and corals, and devoid of coal. A coarse quartzose sandstone, passing into conglomerate, is occasionally developed to a considerable extent between these two divisions. This is a local deposit, being almost confined to England, and may be considered as one of the coal sandstones, of coarser texture than usual. Being occasionally used for millstones, it is called *Millstone grit*. It is accompanied with shales containing the usual coal plants, but generally without any true coal seams. Another locally developed series of beds, consisting of indurated shales, sandstones, and grits, occurs below the carboniferous limestone in South Wales and Ireland, and is known as the *Lower Limestone Shales*. These rest conformably on a series of yellow sandstones, which have been generally referred to the Devonian Measures, but which, from their organic contents, as well as from their stratigraphical position, seem to be basement beds of the carboniferous series. The existence and development of these various beds in the United Kingdom will be better understood by an examination of the following table. The maximum thickness of the beds is given in feet when known; the blanks shew the absence of the division from the particular coal-field:

	Edinburgh.	Glasgow.	N. York.	Derby.	S. Wales.	Kerry.	Clare.	N. Ireland.
COAL MEASURES,	.	6300	2800	2000	2700	12,000	2000	2200
MILLSTONE GRIFF,	.			400	1800	1,000		1800
MOUNTAIN LIMESTONE,	.			1659	1000	1,800	1500	6400
LOWER LIMESTONE SHALES,						500	4650	150
YELLOW SANDSTONE,	.						3000	unknown depth 2000

In the midland counties, the coal measures are the only portion of the carboniferous system present, and these rest on the Silurian or older rocks. In Devonshire, there occurs an extensive series of shales and sandstones, with a few beds of earthy anthracite or culm, associated with argillaceous rocks, probably belonging to the lower limestone shales, much indurated, and traversed by slaty cleavage.

From the great economic value of the contents of the C. S., we are better acquainted with its fossils than with any fauna or flora that flourished before the tertiary epoch. As coal is the result of the mineralisation of vegetable matter, the coal measures must necessarily abound in the remains of plants. No less than 294 species have been described as found in Britain alone. Numerous impressions of plants, as well as traces of structure, are found in the seams of coal themselves; but the more distinct forms are preserved in the interstratified beds of mud and ironstone, often in great number and exquisite beauty. Such remains consist chiefly of imitations of leaves separated from their branches; of casts of trunks, more or less in a broken state; and of roots much compressed, yet occupying their original position in the clay soil now indurated into shale; with these occur pieces of wood, or remains of trees, in which the vegetable texture is to some extent preserved. The great proportion of the plants seem to have flourished in marshy swamps, and to have accumulated where they grew, like peat, the material afterwards converted into coal. Hence a stratum of shale in which are imbedded the roots of *Sigillaria*, *Calamites*, &c., is the invariable

floor on which the coal seam rests. The chief coal plants are *Lepidodendron* (q. v.), *Sigillaria* (q. v.), *Calamites* (q. v.), *Trigonocarpus* (q. v.), and Ferns (q. v.). The existence of cone-bearing trees during this epoch, has been proved from the microscopic examination of prepared sections of fossil woods in which the small discs occur that are characteristic of and peculiar to the conifers.

The animal remains are as numerous and as well preserved as the vegetable. They are found chiefly in the limestone; the greater part, indeed, of this rock, is made up bodily of corals and crinoids. No other such accumulation for extent and variety is known; but it has its nearest parallel in the somewhat similar formation now going on in the Southern Archipelago. The corals and crinoids were specifically as well as individually numerous. The terebratulae and other allied forms of bivalve shells, though belonging to a comparatively limited number of genera, were very abundant. The more highly developed molusca were also numerous; they belonged to a great number of generic types. But the most remarkable group was the fishes. At no time were they more abundant. They belonged to the Ganoid and Placoid groups of Agassiz. The Ganoids, having their entire surface covered with scales, were numerous; some of them inhabited shallow water near the shore, and fed on crustaceans and shell-fish, for crushing which they had a formidable apparatus of conical teeth of a very complicated structure. Others were inhabitants of deep water, and were more powerful and predaceous, and more rapid in their movements. Their jaws were produced into a long snout, like

CARBUNCLE—CARDAMOMS.

the crocodile of the Ganges, and armed with a double series of enormous teeth, which were sometimes as much as four inches long by two inches broad, as in *Megalichthys* (q. v.), dimensions rarely attained even by the largest known reptiles. Associated with these were a great number of sharks belonging to the *Cestraciontidae* (q. v.), a family of which we have only a single living representative. They were furnished with a long bony spine to strengthen the dorsal fin, and thus enable them to turn speedily in the water, as they required to do in seizing their prey. These spines are often found fossil. The only remains referred to a higher division of the animal kingdom yet found belong to the saurian *Archegosaurus* (q. v.), found in the coal-fields of Germany.

**CARBUNCLE**, a name given by lapidaries to the beautiful mineral called *Pyrope* (q. v.), by mineralogists. The C. of the ancients appears to have been either pyrope, or the deep-red variety of noble garnet (see *GARNET*), which is in every respect very similar to it, or probably included both.

**CARBUNCLE** (Lat. *carbunculus*, a little coal) derives its name from the two prominent symptoms—a glowing fiery redness, and a burning pain. It consists of an inflammation, caused by some vitiated condition of the blood, or some atmospheric influence, attacking a patch of skin on the shoulders, nape of the neck, or indeed on any part of the body. The part swells slightly, feels hard, and this hardness extends deeply into the tissues; the pain is very severe, and the patient much depressed with loss of appetite, and general derangement of the secretions. As the disease advances, the redness assumes a dark purple or livid hue, the cuticle rises in blisters, and many small specks of matter appear on its surface, which discharge, and leave apertures like those in the rose of a watering-pot; through this a thin viscid fluid escapes, and occasionally a small slough or core of the true skin which has been killed by the disease. Sometimes these apertures meet, forming large openings, and in others the whole patch of skin sloughs and comes away.

The treatment of C. consists in restoring the secreting organs to a healthy condition, the agents for which must depend on the individual case; in supporting the patient's strength by easily digested food, wine, brandy and bark, with nitric acid; relieving pain by opiates, and encouraging suppuration with warm poultices; carrot, turnip, and yeast poultices being favourite applications in this disease. To prevent excessive loss of skin, the C. must be divided freely with a knife from one margin of the inflamed patch to the opposite one.

**CARBURETTED HYDROGEN** is a term in chemistry applied to several compounds of carbon and hydrogen. Thus, light carburetted or mono-carburetted hydrogen ( $\text{CH}_2$ ) is the gaseous compound popularly known as marsh gas and fire-damp, and is the principal constituent of coal-gas. See *GAS*. Heavy carburetted or bi-carburetted hydrogen ( $\text{O}_2\text{H}_2$ ) is otherwise known as Olefiant Gas (q. v.).

**CARCAJENTÉ**, a town of Valencia, Spain, about 28 miles south-south-west of the city of Valencia, situated on a rich plain near the right bank of the Juncar. It is well built, with good streets, and has a palace belonging to the Marquis of Calzada. It has some manufactures of linen and woollen, and a trade in the agricultural produce of the district. Pop. about 7000.

**CARCANET**, a jewelled chain or necklace. Venice was famous for the manufacture of carcanets in the 15th century.

506

**CARCASS**, in military pyrotechny, is a hollow case of iron, sometimes globular, and sometimes ovate, filled with combustibles. It is fired from a mortar. Its chief use is to ignite buildings in the enemy's quarter, and to give sufficient light to aim the shot and shells. Carcasses are said to have been first used by one of the princely ecclesiastics of Germany, the Bishop of Munster, when he fought against the Duke of Luxembourg at Groll, in 1672. The oval carcasses, being uncertain in their flight, are now nearly abandoned. The round carcasses now made are chiefly those here indicated:

Diameter.	Composition.	Weight.
13 inch.	16 lbs.	212 lbs.
10 "	7 "	100 "
8 "	3 "	51 "
5 "	19 oz.	17 "
4½ "	7 "	9 "

Carcasses are not intended to burst, but to send out, through holes, a furious and inextinguishable fire, which lasts 8 or 10 minutes. The composition with which they are filled, consists of saltpetre, sulphur, mealed gunpowder, pitch, rosin, tallow, and Venice turpentine, about one-half being saltpetre. The composition is packed in tightly through one of the holes; and the holes are stopped with fuses adjusted to ignite the composition after a certain space of time. Sometimes old pistol barrels, loaded to the muzzle, are introduced with the composition. Compare those details with *CASE-AXE*, and *SERILLA*.

**CARCASSONE**, a town in the department of Aude, France, situated on the river Aude, and the *Canal du Midi*, about 55 miles south-east of Toulouse. It is divided into two parts, the old and new towns. The modern town is well built, with streets running at right angles to each other, squares adorned with trees, pleasant boulevards, and several marble fountains. The old town, built on a height, is much more picturesque, with its ramparts and towers, some parts of them dating from the time of the Visigoths, and the rest, with the castle, from the 11th or 12th century. This old town suffered greatly at the hands of the fierce bigot Simon de Montfort and his crusaders, who here burned 400 of the Albigenses. In the 14th c. it effectually resisted the Black Prince. The cloth manufactures are important, employing, it is said, upwards of 7000 people. C. has also manufactures of paper, leather, linen, and soap. Pop. (1872), exclusive of garrison, 18,396. The ancient name of the town was *Carcaso*, which was a place of some note in the time of Caesar.

**CARCHARIAS.** See *SHARK*.

**CA'R'DAMINE.** See *CRESS*, *BITTER*.

**CA'R'DAMOMS** are the capsules of certain species of plants of the natural order *Scitamineæ* (q. v.), and belonging to at least two genera, *Anomum* and *Elettaria*. They are three-celled, and contain numerous wrinkled seeds, which form an aromatic pungent spice, weaker than pepper, and with a peculiar but agreeable taste. On account of their cordial and stimulant properties, they are employed in medicine, very generally to qualify other medicines; they are also used in confectionary, although not to a great extent in Britain; but in Asia they are a favourite condiment; and in the north of Germany, they are used in almost every household to flavour pastry.—The C. recognised in the British pharmacopæia, and called *True* or *Officinal C.*, also known in commerce as *Malabar C.*, are the produce of *Elettaria Cardamomum*, a native of the mountains of Malabar and Canara. They depend for their qualities on a peculiar pungent essential oil, called *Oil of Cardamom*, which may be obtained from them by distilling them with water, and when fresh, is

colourless. Other kinds of C. occur in commerce, but none is equal to the true C. in commercial value. The different kinds of C. differ not only in strength, but in the character of their aroma. The plants producing them have much general similarity.

CARDAN, JEROME, a celebrated mathematician, naturalist, physician, and philosopher, born at Pavia, September 24, 1501, was the illegitimate son of a physician and jurisconsult at Milan. He received his early education at home, and completed his studies in Pavia and Padua. After some years, he became professor of mathematics at Milan. Here his reputation began to grow. After a few years, he began to lecture on medicine, to the practice of which he ultimately betook himself. By 1546, his reputation had so increased, that he was invited by the king of Denmark to accept a professorship at Copenhagen, which, however, he declined; and in 1552, we find him proceeding to Scotland, on an invitation from Hamilton, primate of that country. He managed to cure the primate of an inveterate asthma, which had defied the skill of the most celebrated physicians, and returned to Milan enriched by the bounty of his patient. Here he again settled for some time. In the autumn of 1553, however, he removed to Pavia as professor of medicine, whence, again, in the same capacity, he removed to Bologna, where he continued teaching till 1570, when we find him imprisoned for debt. Having regained his liberty in 1571, he went to Rome to avoid his creditors. Here he was speedily admitted a member of the medical college, and pensioned by Pope Gregory XII. The rest of his life he spent, without public employment, in Rome, where he died, September 2, 1576, a few weeks after finishing his autobiography. Some writers assert, but on no sufficient authority, that he starved himself to death, to fulfil a prediction which he had made as to the time when he should die. It is certain, however, that he was a devoted astrologer, and cast horoscopes for himself and others. The fancifulness necessary to support the faith of an astrologer imbued all his scientific writings. These were very voluminous. A summary of his notions on physics and metaphysics is given in his two works—*De Subtilitate*, in 21 books, and *De Rerum Varietate*, in 17 books. On the whole, he wrote 122 treatises on physics, mathematics, astronomy, astrology, rhetoric, history, ethics, dialectics, natural history, music, and medicine. These, it need scarcely be said, abound in incoherent paradoxes, contradictions, and capricious abstractions, more than enough to overwhelm the few profound ideas which he originated. A formula for the solution of certain kinds of cubic equations is called 'Cardan's formula,' and was published by him, as his own invention, in the *Ars Magna sive de Regulis Algebraicis* (1545); but it would appear that the formula was really the invention of one Tartalea or Tartaglia. In religion, C. was heterodox, and commonly reputed an atheist. His numerous writings were collected and edited by Charles Sphon (10 vols., Lyon, 1663).

CARDBOARD, or CARD, is made by pasting together several layers of paper, according to the thickness and quality required. *Bristol-board*, used by artists, is made entirely of white paper; ordinary C., of fine white paper outside, with one or more sheets of coarse cartridge-paper between. According to the number of layers, they are called *three, four, six, or eight sheet boards*. *Mill-board*, used by bookbinders as the basis of book-covers, is made of coarse brown paper, glued and strongly pressed.

The workman arranges the paper in the order required for pasting, and the pile, called a *head*, is

placed at his left hand, the paste-tub on his right. He lifts a sheet from the head with his left hand, brushes it over with paste with his right; then another is laid upon that and pasted, until he comes to the last required to complete the thickness of one board, when he removes two sheets, and only pastes the upper one, which thus forms the lower sheet of another board. This is repeated till the whole head is pasted, when it is removed to a press, and the water of the paste squeezed out at the edges. The boards are then separated, and dried by hanging them in a room artificially heated. The C., which is now rough and warped, is smoothed and flattened by making a pile consisting alternately of sheets of rough C. and copper plates, with a copper plate at top and bottom. This pile is passed between iron rollers, and the smooth surface of the copper impressed upon the C., which is thus flattened and beautifully polished.

The enamelling of address-cards is produced by brushing over the C. a mixture of *China* or *Kremnitz white* (a fine variety of white lead) and size. After drying, this surface is rubbed lightly over with a piece of flannel, previously dipped in finely powdered talc; it is then polished by rubbing vigorously with a hard close-set brush.

CARDIA, the upper orifice of the stomach, called, on account of its vicinity to the heart, by the same Greek name, *cardia*, and probably hardly distinguished from it in the earliest times of Greek medicine.

CARDIAC MEDICINES, stomachic and stimulating remedies—cordials, so called from their action on the heart through the stomach. See CARDIA.

CARDIALGIA, pain of the heart or stomach (CARDIA). The name is commonly applied to the particular variety of pain called *heartburn*, arising from a disordered stomach, and accompanied with acid eructations. See INDIGESTION.

CARDIFF (*Caer-Taff*, Fort of the Taff), a parliamentary and municipal borough and seaport, one of the county towns of Glamorgan, South Wales, situated on the river Taff, 170 miles west of London by railway. The population has risen from 2000 in 1801, to 56,911 in 1871, with a floating population of about 5000. C. with Cowbridge and Llantrisant, returns one member to parliament. The town extends about one mile in each direction from the town-hall. Among the public buildings are the Glamorganshire and Monmouthshire infirmary, town-hall, free library and museum, and county jail. There are also many private buildings of a superior character, and a public park. Of places of worship in C., 9 belong to the Church of England, 15 to the Independent and Baptist communities, 6 to the Wealeyan, and about 15 to other sects.

The port of C. is the outlet for the large mineral and manufactured produce of the central portion of the South Wales mineral-field, in which are the populous districts of Merthyr-Tydvil, Rhymney, Aberdare, and the Rhondda Valley, with which this port is connected by the Taff Vale, the Rhymney, and the Ely Valley Railways, and the Glamorganshire Canal. The town is also one of the chief stations on the Great Western line from London to Milford-Haven. The Bute docks, east and west, with an area of 76 acres, constructed at the expense of the Bute estate, have cost upwards of a million sterling, and belong entirely to the present marquis. There are about 40 staiths on the quays of the docks, with machinery of a peculiar construction for the purpose of loading vessels with coal, by which the breaking of the coal is almost entirely prevented. Each of these staiths is

capable of shipping 560 tons of coal in a day of 12 hours. There is also a tidal harbour, with 7 staiths, each capable of shipping 400 tons of coal per day, and a low-water pier 1400 feet in length. Height of water at spring-tide, 31 feet 8½ inches; at neap-tide, 21 feet 7½ inches. Width of sea-gates, 55 feet; length of quays, 11,100 feet; width of dock, 300 feet southern, and 500 feet northern part; depth, 25 feet. Exports during 1872—coal, 2,603,260 tons; iron, 250,221 tons; coke, 8401 tons; patent fuel, 63,244 tons. Coast-wise—coal, 933,328 tons; coke, 4123 tons. The quantity of coal exported has nearly doubled within ten years. The imports to C. include copper ore, live cattle, salted provisions, foreign fruit and vegetables, corn and flour, &c. The Penarth Docks, about 3 miles to the westward, form another outlet for the trade of the district. Steamers ply between the port of C. and New York, London, Liverpool, Bristol, Cork, Whitehaven, and Burnham.

The assizes (half-yearly, alternately with Swansea) and the quarter-sessions are held at the Town Hall. The ancient city of Llandaff, now a mere village, is almost connected with Cardiff. Cardiff Castle, built in the 11th c., is partly now in ruins, and partly occupied by the Marquis of Bute, to whom nearly the whole of the modern town belongs. Robert Duke of Normandy, brother of Henry I., died in the castle, after being a prisoner for 28 years. Cromwell (1648) got possession of the castle by treachery, after bombarding it three days; and he afterwards hanged the traitor, as an example to his own soldiery. This town was anciently an important one, successively under the British, Romans, and Normans.

CARDIGAN (anciently, *Aberteifi*, Mouth of the Teify), the county town of Cardiganshire, a parliamentary and municipal borough and seaport, in the south-west corner of the county, on the right bank of the Teify, 3 miles from its mouth, and 239 miles north by west of London. The vicinity exhibits romantic scenery on the Teify, and grand rocks on the coast. The streets, except the chief one, are narrow and steep, the houses built of slate-rock. Pop. of the municipal borough (1871), 3461; of the parliamentary borough, 4939. With Aberystwith, Lampeter, and Adpar, C. returns one member to parliament. In 1872, 503 vessels, of 15,643 tons, entered and cleared the port. The general trade is confined to vessels of 20 to 100 tons. Vessels of 400 tons reach the town by spring-tides. C. became an important town about the Norman Conquest. The Normans were frequently defeated before mastering it. There are the remains of a castle on a low cliff on the Teify, which is supposed to have been founded, in 1160, by a Norman baron. The town suffered much in the struggles between the Welsh and the Normans. The Teify is said to have been the last British resort of the beaver.

CARDIGAN BAY, a semicircular bend of St George's Channel, on the west coast of Wales, 45 miles wide from north to south, and 20 miles deep, with a sweep of coast of 110 miles. Its exterior points are Brach-y-Pwll, off which lies Bardsey Isle, in Caernarvon, and Sturm Head, in Pembroke. It receives the rivers Mawddach, Dovy, Ystwith, Yren, and Teify. It has 3 to 30 fathoms water, with three reefs. A strong current sweeps round the bay from south to north. Almost all the harbours on the coast are obstructed by bars. A great part of C. B. is said to have been once dry land, protected, as Holland now is, by dams and dikes, and containing 16 towns, and the land is said to have been submerged about 520 A.D.

CARDIGANSHIRE, a maritime county in

South Wales, on Cardigan Bay, with an area of 675 square miles, a half being waste. The surface is hilly, interspersed with fertile valleys. A rugged, bleak range of hills runs through the middle of the county, from the south-west to the north-east, between the coast and the Teify, ending abruptly in a shelving beach in the middle of the coast, but on other parts there are rich flat tracts. The county contains little wood. The chief rivers are the Teify, which rises in a small lake near the centre of the county, and runs 70 miles south-east and east along the south border of the county, the Claerwen, Ystwith, and Rheidol. C. contains some romantic waterfalls, especially the Rheidol Falls and the Devil's Bridge, and above 20 small lakes or llynns, noted for their wild beauty. C. reposes on Lower Silurian slates and shales, containing few or no organic remains. Rich veins of copper, lead, zinc, and silver occur. The climate is cold and wet, but mild though wet on the coast. Snow lies long on the hills in winter. Summer is delightful in the valleys. C. is an agricultural county, and its chief branch of industry is the rearing of live-stock. The chief crops are oats, barley, and potatoes on the poor clay and peat soils of the mountains, and wheat, barley, and potatoes on the flat loams of the coast and valleys. The cattle and horses are small. There are some manufactures of coarse woollens and gloves, stockings and hats. Oats, barley, cattle, sheep, pigs, butter, slates, and woollens are exported. Cardigan is the county town; the other chief towns being Aberystwith, Lampeter, Adpar, Aberayron, Tregaron. C. sends one member to parliament. Pop. (1871) 62,712; registered electors, 5554. In 834, the king of C. became king of all Wales, under the title of Roderick the Great. He divided Wales among his three sons. After this, the Danes and Normans overran Cardiganshire. The county has many remains of British and Roman camps and roads, Druidical circles, cairns, and castles. Many Welsh princes and bards were buried in the abbey of Strata Florida, 16 miles south-east of Aberystwith, and some of the records of the principality were kept here. In C. there is a curious practice of sending presents (*biddings*) to a new-married couple, which, when sold, often realise £50 or £60. C. was disturbed, 1843–1844, by the Rebecca riots.

CARDINAL (Lat. *cardinalis*, principal, from *cardo*, a hinge). Cardinals are the highest dignitaries in the Roman Church after the pope, whose electors and councillors they are. The title, however, had at first a more general application. The pope being the sovereign bishop over the whole Roman Church, and having, as such, many duties to fulfil inconsistent with those of a particular diocese, had, from very early times, a number of bishops, priests, and deacons whom he appointed his vicars and coadjutors for the management of the diocese of Rome. The bishops exercised the episcopal function in the pope's stead, each having a peculiar church within the diocese. The priests were titular parsons of the churches in the city of Rome, and had the cure of souls. The deacons had charge of some churches and chapels of devotion, which they held as deaneries, with the additional duty of assisting the pope when he officiated in public. These three classes of ecclesiastics were called *cardinati* or *cardinales*, to denote that they were the first or chief over the rest, and that all the affairs of the diocese of Rome were under their direction. At a subsequent period, the priests and deacons of other cities of importance assumed the title of C., to distinguish them from other priests and deacons over whom they claimed supremacy; but the popes subsequently ordained that none but those

## CARDINAL—CARDINAL BIRD.

whom they had chosen should be honoured with that title. Amongst those whom the popes thus appointed were the seven bishops *suburbicarii*, who took their titles from places in the neighbourhood of Rome. These bishops were called *hebdomadarii*, because they attended the pope for a week each in his turn. These cardinals took part with the Roman clergy in the election of the pope, who was generally chosen from their number. About the beginning of the 12th c., the popes having formed a regular court, began to bestow the rank of C. priest or C. deacon on any individual of the clergy, or even of the laity, whom they chose to select; and to each, whether Roman or foreign, they gave the title of some particular church in Rome, but without attaching to it any obligatory service. Thus the cardinals became a separate body elected for life, and the officiating priests of the Roman parishes were gradually deprived of the title. In 1159, Nicholas II. limited the right of election to the popedom to the cardinals thus appointed, leaving to the rest of the clergy and people of Rome merely the right of approving of the election of a new pope, and to the emperor that of confirming it. Even these prerogatives, in course of time, were withdrawn. Notwithstanding the great powers thus intrusted to them, the bishops in the great councils of the church continued to take precedence of the cardinals; and it was not till 1614 that Louis XIII. of France, in the sitting of the parliament of Paris, adjudged precedence to the cardinals over the ecclesiastical peers—bishops and abbots. The power of the pope to appoint cardinals has often been contested, and their right to precedence denied, by the other dignified ecclesiastics. In 1567, Pope Pius V. forbade any clergyman not appointed by the pope to assume the title of C.; and Sixtus V., in December 1586, fixed their number at 70—viz., the 6 bishops *suburbicarii*, 50 priests, and 14 deacons, and on this footing they have since remained, though the number is seldom complete, the pope generally leaving some vacancies for extraordinary cases. The number has frequently fallen greatly under 70. When Nicholas III. was chosen pope, there were but eight cardinals; and a little before the death of Alexander IV., there were but four. Sometimes before Sixtus V. the number was exceeded, as in the pontificate of Pius IV., when there were 74. The body of cardinals is styled the Sacred College. Most of the cardinals reside in Rome, and either enjoy ecclesiastical benefices, or are employed in the administration. When not so provided for, the cardinals receive an allowance of 100 dollars monthly from the papal treasury. Some cardinals belong to monastic orders, and reside in their convents even after their election. The jurisdiction of the C. bishop in the place in which they are established is truly episcopal, but they are not obliged to reside. That of the C. priests and deacons is almost episcopal, but extends no further than the church and sacristy. They have there an episcopal seat under a canopy, like bishops, and they there solemnly give the people their blessing. The creation of cardinals is wholly in the pope. If the new-created C. is at Rome, he goes the same day to visit the pope, who puts the red cap on his head. The red hat, which Innocent IV. ordained that cardinals should wear, to shew that they ought to expose themselves to the shedding of their blood in the cause of the church, is afterwards given in a public consistory. A number of symbolical ceremonies accompany this investiture. The cardinals that are absent, when chosen, have the cap sent them by a special messenger from the pope. The hat is given by the pope's own hands; and many cardinals who do not visit Rome, die

without ever having received it. The only exception is in favour of members of royal houses, to whom the hat is sent. Pope Urban VIII., in 1630, gave to the cardinals the title of Eminence,

Cardinal's Hat.

which they shared with the grand-master of the Order of Malta, and the ecclesiastical electors of the German or Roman Empire. The pope often employs cardinals as ambassadors, and the individual thus employed is styled Legate *a Latere*. A C. legate acts, or recently acted, as governor of the Northern Provinces of the Papal States, which thence received the name of Legations. The chief secretary of state, the *Camerlengo* or minister of finances, the Vicar of Rome, and other leading officials, are always chosen from among the cardinals. The Council of Cardinals, when assembled under the presidency of the pope to discuss matters of church and state, is called the Consistorium. There are public consistories, which are held on great occasions, and correspond to the levees of other sovereigns; and private and secret consistories, which are the privy council of the pope. Moreri's *Dictionary*, *voce Cardinal*, contains a list of cardinals from 1119 to 1724, with their names, countries, &c., and the dates of their election and death.

**CARDINAL BIRD**, or **RED BIRD** (*Guarica cardinalis*), also called cardinal finch, cardinal grosbeak, and Virginian nightingale, one of the

Cardinal Finch (*Guarica cardinalis*).

finest song-birds of America, belongs to the family of *Fringillidae*, and differs from the true grosbeaks (*Coccothraustes*) in having the beak slightly bulging. The general colour of the male is red, the head being vermillion, and only a small portion of the plumage around the base of the bill being black. The feathers of the crown are long, and erected into

## CARDINAL FLOWER—CARDINAL VIRTUES.

a conical crest, like a red cap. The C. B. abounds in Texas, Florida, and the Southern States of America generally, migrating northwards in spring, but never further than Massachusetts, where only a few stragglers are seen. Its loud, clear, sweet, and varied song is to be heard chiefly in the mornings and evenings. In size it exceeds any of the British *Fringillidae*, being about equal to the starling.

**CARDINAL FLOWER.** See LOBELIA.

**CARDINAL POINTS.** See COMPASS, MARINERS'.

**CARDINAL VIRTUES** (Lat. *cardinalis*, chief, from *cardo*, a hinge). The C. V. of the ancients were Justice, Prudence, Temperance, Fortitude. They were so called because the whole of human virtue was supposed to hinge or turn upon them. In other words, they were considered as a full and comprehensive classification of man's various duties.

This mode of dividing the virtues is to be found as far back as Socrates. The ancient moralists treated under Ethics the whole sum of human duty and virtue. Thus, Aristotle considers the great problem of the science to be the determination of man's highest good, together with the means of realising it. Hence, he includes both the social virtues and the prudential regard to the welfare of the individual in the same scheme. Of the four C. V., it will be seen that the first, Justice, is the social virtue; that Prudence (which, properly speaking, includes Temperance also) regards the wellbeing of the individual; while Fortitude is necessary to both. This last was a virtue greatly esteemed in the ancient world, each one's lot being much less secure than with us in the present day; it was impossible to say what sufferings might be in store for the most prosperously situated of men.

Dr Whewell has made an attempt to correct the more obvious defects of the classification, and has substituted one which he deems free from those defects. The most notable omission, in the ancient scheme, judged from the modern point of view, is the absence of all reference, either expressly or by implication, to the virtue of Goodness or Benevolence. This was characteristic of the pagan moralists; for although good deeds were abundantly practised among the ancients, they did not account it a part of human virtue to flow out spontaneously in every kind of active benevolence, including the most wicked and worthless among the objects of it. Aristotle, in discussing the various acts and outgoings of friendship, never loses sight of the reciprocal obligations on the other side; so that when a rich man befriends, with his wealth, one that is poor, the inequality must be made good by a greater amount of honour or respect on the part of him that is so befriended.

Accordingly, to adapt the classification to the altered point of view, Benevolence has to be added to the list. This is Dr Whewell's first virtue; the others are Justice, Truth, Purity, and Order. But the scheme, as thus amended, is scarcely less objectionable than before. The virtue named last, Order, which means obedience to authority, cannot but contain a very large portion of all the rest; seeing that Justice, Truth, &c., are enjoined by positive law. Then, what is understood by Purity, including the control of the two powerful appetites, Hunger and Sex, is partly prudential and partly social.

The ethical discussions of modern times may be very much aided, if we divide the totality of human virtue on the following plan. There are three distinct classes of human actions, which are all approved of or accounted virtuous, but on different grounds, and in a different manner.

610

1. There are actions which are forbidden by society under penalties; in other words, men are punished for committing them. Such are theft, breach of bargain, slander, violence to the person, and all the offences against our fellow-men that are prohibited by the law of the land. The avoiding of all these actions is signified to be a part of our duty, by the suffering inflicted on the doers of them. The law fines, imprisons, or puts to death those who will not conform to its regulations.

The law of the land is not the only power that prescribes conduct enforced by penalties. The public opinion of the country at large forbids certain actions, and punishes transgressors by excluding them from social intercourse; such, for example, are acts of unchastity, more especially when committed by women. There are also codes enacted by particular societies, as the code of honour among gentlemen, which constitutes some actions offences that are not so by law, or by universal opinion. Cowardice is one of the qualities most obnoxious to the code of honour.

The actions prohibited by law are obviously such as could not be allowed without the entire subversion of human society. If murder and theft were to go unpunished, the principal end for which men associate together in communities—that is, protection and security—would not be attained. It is impossible that we should not disapprove of all such actions, and approve of the contrary.

2. There are some actions that are accounted virtuous, while their opposites are not punished, as in the case of those now mentioned. Doing good to persons that have no claim upon us—in other words, benevolence or philanthropy—is considered highly praiseworthy; but the neglecting of this is not usually visited with any punishment or censure; so that if it be a duty to perform acts of benevolence, it is a duty generically different from paying our debts, and respecting the person and property of our neighbour. The motives brought to bear on the two cases are widely contrasted: in the one, we *punish* for doing the action forbidden; in the other, we *reward* for doing the thing enjoined, and inflict no punishment if that is neglected. Here lies the difference between *duty*, strictly so called, and *merit*. In the bare performance of duty there is no merit; a man would not even be commended for the punctual payment of his just debts, if it were not that many people are deficient in this respect, and in the comparison with these the correct person excites in our minds a feeling of satisfaction. *Disapprobation* is the sentiment properly concerned with duty, or rather, with breach of duty; *approbation* is bestowed on all who do something over and above their duty. This distinction is known in every department of practical life; while speculative moralists habitually lose sight of it.

3. The virtues included under Prudence are in a different position from either of the foregoing classes. Bearing the common names, virtue and duty, by which they are recognised as worthy of approbation or commendation, they are nevertheless unaccompanied with the sanctions either of punishment or of reward. The imprudent man is subject to no legal penalty, unless he clearly involves other persons in his imprudence; and the prudent man is not rewarded with the praise, esteem, or other benefits conferred upon the benevolent man. It is true that the young are punished by parents or teachers for imprudences; and some governments take such a paternal care of their subjects, as to punish them for sins against themselves. Men have been sent to prison, because of their endangering their own salvation by embracing heresy; but at the present day, such a proceeding is considered

beyond the function of government. Men and women, arrived at maturity, are expected to take care of their own interests; even if they do not, no one punishes them; if they do, no one rewards them. We have, it is true, a certain feeling of disesteem in the one case, and of esteem or commendation in the other; neither of which, however, attains any considerable strength until more than the individual's self is involved. In short, although we cannot divest ourselves of all sentiment as lookers on, when men behave prudently or imprudently, our rule is *non-interference*; and this constitutes a marked distinction between the self-regarding and the social vices and virtues.

Accordingly, when ethical writers are endeavouring to probe the foundations of the moral sense in man, they ought to consider separately those three different species of conduct, for the sentiment excited by each is marked by strong peculiarities. To class social duties enforced by punishment, social virtues stimulated by rewards, and prudence, which is accompanied by neither, under one common designation, and discuss them as if they were essentially the same, is to confuse, instead of clearing up, the first principles of morality.

In Roman Catholic systems of theology, there are declared to be four *cardinal virtues*—‘Prudence, Fortitude, Temperance, and Justice’—from which all other ‘moral’ virtues are represented as flowing. But there is a prior division of virtues into the two classes of *theological* and *moral*; the theological virtues being Faith, Hope, and Charity. The distinction between these two classes is represented as consisting in this, that the theological virtues ‘immediately regard God;’ and the moral virtues do not immediately regard God, but are commanded and rewarded by God, and are beneficial to ourselves.

**CARDING OF COTTON**, &c., the process of disentangling and arranging in parallel rows the fibres of cotton. This operation may be compared to the combing and brushing of one's hair, and the card combines the properties of the comb and brush, being a brush with wire teeth instead of hairs. These teeth are inserted in strips of leather, which are fixed upon the surface of a cylinder. Several such cylinders are arranged so that the ends of the teeth are nearly in contact; and the cotton being brought to them, is caught up, passed from one to the other, and combed out as the cylinders revolve in the form of beautiful films or fleeces, which are removed by a smaller drum-card, called the 'doffer,' and again from this by the 'doffing-knife.' These films, which are of the width of the drum, are next contracted to a narrow ribbon, by being passed through a funnel; and thus narrowed, are called the 'card ends' or 'alivers,' and are now ready for the next process of 'drawing' or 'doubling.' See SPINNING.

**CARDINIA**, a genus of fossil conchifers, containing 85 species, which extend from the Silurian to the inferior oolite. They have an oval or oblong shell, attenuated posteriorly, and marked with lines of growth, and an external ligament. They occur abundantly in the valuable layers of clay-ironstone called 'mussel-bands.' In Derbyshire, this material is wrought, like marble, into vases.

CARDITIS, or inflammation of the heart, a form of disease of very rare occurrence, if the term be limited in its application to cases of true acute inflammation of the muscular structure of the heart itself. C., however, was commonly understood in a wider sense, so as to include certain forms of disease of the external and internal lining membrane of the heart; and it is only since the beginning of the

present century the  
in medical pathology;

*Kew-ko-wan*—that is to say, the nine ten-thousands of *kwan*, strings of beads, shells, or money; and the titles of the other two suits are equally concise and significant. The Chinese C. have, however, a decided advantage over those of Hindustan in being oblong instead of circular.

C. do not appear to have been known in Europe until towards the end of the 14th century. ‘In the year 1379,’ writes Carelluyzo, ‘was brought into Viterbo the game at cards, which comes from the country of the Saracens, and is with them called *nabi*.’ ‘Whence afterwards,’ says Mr W. Chatto (*Origin and History of Playing Cards*, Lond. 1848), ‘perhaps Jackanapes, Jack of cards.’ This entry occurs in the accounts of the treasurer of Charles VI. of France, in 1393: ‘Given to Jacquequin Gringonneur, painter, for three packs of cards, gilt and coloured, and variously ornamented for the amusement of the king, fifty-six sols of Paris.’ From the date of this year being immediately subsequent to that in which the king lost his reason, the story goes that C. were invented to divert his royal melancholy; but they were certainly of earlier use in France. The French clergy took greatly to C. about this time; we are afraid, too, it was to the ungentle game of All-fours, since we find them specially forbidden that amusement by the synod of Langres, in 1404.

Card-making became a regular trade in Germany fourteen years after this, and it, as well as card-painting, seems to have been carried on for some time exclusively by females; the wood-engraving of C., however, did not begin until some time afterwards. The pipes were then very prettily imagined, the suits consisting of hearts, bells, acorns, and leaves. The place of her majesty the queen was filled by a knight in those days; and it is to Italy, and not to Germany or France, that the glory of giving *place aux dames* must be conceded. There was also no ace whatever! By 1420, gambling by means of C. had grown to such a pitch, as to provoke St Bernardin to preach against it at Bologna; and that so eloquently, as to cause his hearers to make a fire in the public Place, and throw all the C. in their possession into it—a proceeding which must have been hailed with joy by the Messrs De la Rue of that period. The signs upon Italian C., which seem to have been the first imported into England, were cups, swords, money, and clubs; but in the third year of Edward IV., their further importation was forbidden, and the home-trade of card-making protected. C. were played by that time, we read, ‘in all places of worship’ in this country, by which it was meant, not in the churches, but in the houses of all the gentry. Henry VII. was a cardplayer; and there are not a few entries in that mean monarch’s privy-purse account of his majesty’s little losings. His daughter Margaret, at the age of fourteen, was found by James IV. of Scotland—the first time he ever saw her—in the act of playing cards; and it was most probably *scarts*, for he at once ‘proposed’ to her, and she ‘accepted’ him. There was a sum regularly allotted to the Princess, afterwards Queen, Mary, as pocket-money for this especial purpose; the sums given her at a time for immediate disbursement ranging from 20s. to 40s., but one entry being so disgracefully low (for a princess) as ‘two and tuppence.’ James I. likewise played a good deal, but so sleepily, that he required somebody to hold his C. for him.

About the year 1660, heraldic C. were first introduced into England, the King of Clubs being represented by the arms of the pope; of Spades, by those of the king of France; of Diamonds, by those of the king of Spain; and of Hearts, by those of the king of England. From these heraldic

C., we suppose, Mr Chatto derives the word coat-card, instead of court-card, which is certainly in more general use. In 1679, a pack was published containing the history of all the popish plots, excellently engraved on copper-plates, with very large descriptions under each card. Aspersors of this pack, it is added by their disinterested publisher, ‘plainly shew themselves to be popishly affected.’

The French, from whom we derive our ordinary suits of diamond, heart, spade, and club—*carreau*, *cour*, *pique*, and *trèfle*—were continually changing their court-cards, and representing on them all sorts of historical characters. In the earlier periods, their kings were David, Alexander, Caesar, and Charlemagne, or Solomon, Augustus, Clovis, and Constantine; about all of whom, as well as their queens, Pére Daniel has the most ingenious theories. Troope, says he, however brave and numerous, require to have prudent and experienced generals. The *trèfle* or clover-plant, which abounds in the meadows of France, denotes that a chief ought always to encamp his army in a place where he may obtain forage for his cavalry; *piques* and *carreaux* signify magazines of arms, which ought ever to be well stored—the *carreau* being a sort of heavy arrow shot from a cross-bow, and which was so called from its head being squared (*carré*); *cœurs*, hearts, signified courage of both commanders and soldiers; the *ace* was the Latin *as*, and represented money, the sinews of war: and so on.

At the time of the French Revolution, the places of the card-kings were filled by four philosophers—Molière, Lafontaine, Voltaire, and Rousseau; and those of the queens by four virtues—Prudence, Justice, Temperance, and Fortitude.

Many attempts have been made to put down card-playing by the strong hand of the law; but the history of the Four Kings has, nevertheless, always retained its students. Not a few enthusiastic players have absolutely died in harness, with cards in their hands, such as the great Bath player Lookup, who expired at his favourite ‘Double Dumby,’ not even being permitted by inexorable Death to play out the game. The Four Kings, like their flesh-and-blood originals, are likely to lose all sway over the New World; for Mr Chatto informs us, that the court-cards, if they can be called so, of a republican pack manufactured in 1848 at New York, have neither kings nor queens; the President of Hearts being Washington; of Diamonds, John Adams; of Clubs, Franklin; and of Spades, Lafayette. One of the queens is Venus, modestly concealing her charms; and the others are respectively Fortune, Ceres, and Minerva: while the knaves are fitly represented by Indian chiefs.

The manufacture of playing-cards comprises many interesting processes. The cardboard employed for this purpose is formed of several thicknesses of paper pasted together; there are usually four such thicknesses; and the paper is so selected as to take paste, paint, and polish equally well. The sheets of paper are pasted with a brush, and are united by successive processes of cold-drying, hot-drying, and hydraulic pressure. Each sheet is large enough for forty cards. The outer surfaces of the outer sheets are prepared with a kind of flinty coating, which gives sharpness to the outline of the various coloured devices. Most packs of cards are now made with coloured backs. The ground-tint is laid on with a brush, and consists of distemper colour, or pigments mixed with warm melted size. The device impressed on this ground-tint is often very beautiful. Messrs De la Rue, the leading firm

in the manufacture, employ tasteful artists, and invest a large amount of capital, in the introduction of new patterns. On cards sold at moderate prices, the colours at the back are generally two—one for the ground, and one for the device; but some of the choicer specimens display several colours; and many of the designs are due to the pencil of Mr Owen Jones. The printing of the design is done on the sheets of paper, before the pasting to form cardboard. The pipes or spots on the faces of playing-cards are now *spades*, *clubs*, *hearts*, and *diamonds*; but at different times, and in different countries, there have been leaves, acorns, bells, cups, swords, fruit, heads, parasols, and other objects similarly represented. In English cards, the colours are red and black; Messrs De la Rue once introduced red, black, green, and blue for the four suits; but the novelty was not encouraged by card-players. The same makers have also endeavoured to supersede the clumsy devices of kings, queens, and knaves, by something more artistic; but this, too, failed commercially; for the old patterns, like the old willow-pattern dinner-plates, are still preferred—simply because the users have become accustomed to them. Until within the last few years, the printing of cards was generally done by *stencilling*, the colour being applied through perforated devices in a stencil-plate. The colour employed for this purpose is mixed up with a kind of paste. When there is a device at the back, the outline of the device is printed from an engraved wood-block, and the rest filled in by stencilling. The stencilling of the front and back can be done either before or after the pasting of the sheets into cardboard. One great improvement in the manufacture, has been the substitution of oil colour for paste or size colour; and another, the substitution of printing for stencilling. Messrs De la Rue have expended large sums of money on these novelties; for many experiments had to be made, to determine how best to employ oil colour so that the spots or pipes may be equal-tinted, the outline clear and sharp, the pigment well adherent to the surface, and the drying such as to admit of polishing without stickiness. The plates for printing are engraved on copper or brass, or are produced by electrolyte, or are built up with small pieces of metal or interlaced wire. The printing is done in the usual way of colour-printing, with as many plates as there are colours (usually five), and one for the outlines; it is executed on the sheets of paper, before being pasted into cardboard. When the printing, drying, and pasting are all completed, a careful polishing is effected by means of brush-wheels, pasteboard wheels, heated plates, and heated rollers; in such a way that the polish on the back may differ from that on the face—since it is found that two equally polished surfaces do not slide quite so readily over each other. Every pack of cards made in England for home-use pays a duty of threepence, which duty is levied on the ace of spades. The makers of cards pay £1 per annum for a licence, and formerly the venders had to pay 2s. 6d. per annum, but this latter tax was repealed on the 5th July 1870. The cardboard, when all the printing is finished, is cut up into cards; every card is minutely examined, and placed among the 'Moguls,' 'Harrys,' or 'Highlanders,' as they are technically called, according to the degree in which they may be faultless or slightly specked; and the cards are finally made up into packs. Persons wishing the best cards should ask for 'Moguls,' the usual retail price for a pack of which is 2/3 to 3/9.

A few years ago, it was estimated that about half a million packs of cards are made annually in England, by about seven or eight firms. Card-playing is not now so general in England as it

was early in the century, and the number made has consequently lessened, although the quality has greatly improved. All the cards used in Russia, with a few exceptions, are made at an imperial manufactory in St Petersburg, where the operations are conducted on a large scale, and where the number of packs made exceeds manifold the whole produce of England. The French cards are somewhat smaller and thinner than those of England.

CARDUELIS. See GOLDFINCH.

CAR'DUUS. See THISTLE.

CARE or CARLE SUNDAY, the Sunday before Palm Sunday, said to be so called because it was the practice in many parts of the country to eat gray peas, called carlings, fried in butter, pepper, and salt, on this day. This practice apparently had its more immediate origin in the custom of the Roman Catholic Church of eating hallowed beans fried at this time—these beans being described in some religious books as symbolical of confession, and their steeping before use, of meditation. It appears, however, to have been adopted by this church from a heathen custom. See Brand's *Popular Antiquities*.

CAREENING is the operation of heaving down a ship on one side, in order to expose the other side for cleaning by the process of *Breaming* (q. v.). C. is seldom now performed upon English ships, partly because the use of copper-sheathing lessens the fouling of the bottom, and partly because caissons and hydraulic lifts afford means for raising ships out of the water. The *Great Eastern*, in 1860, was placed upon an open scaffolding or frame, called a *gridiron*, in Milford Haven, and floated so as to render cleansing possible without the dangerous and difficult process of careening.

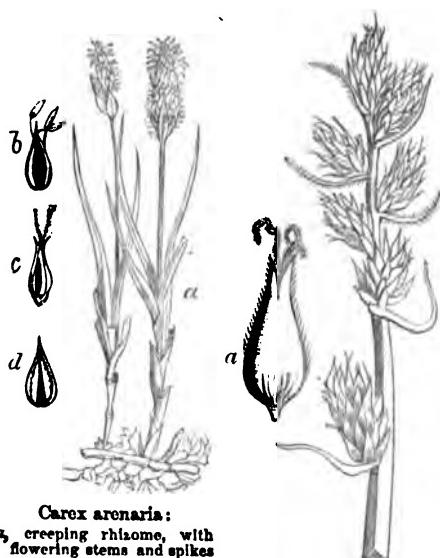

In sea-phrase, a vessel is said to 'careen' when she leans over very much through press of sail.

CA'RET (from the Latin *cereo*, I am wanting), a character of this form,  $\wedge$ , denoting that something has been omitted, and is interlined.

CAREW, THOMAS, a poet of the reign of Charles I., descended from an old family in Gloucestershire, was born 1589. Having been educated at Oxford, he travelled abroad for some time, and on his return was received at court, and patronised by Charles I. C. deserves mention chiefly as the precursor and representative of what may be called the courtier and conventional school of poetry, whose chief characteristic was scholarly ease and elegance, with a spice of indelicacy, and even indecency. C.'s poems, mostly lyrical, and treating of trifling subjects, are among the best of their kind, and exhibit much fancy and tenderness. He died 1639. Several editions of his poems, which first appeared in 1640, have been published.

CA'REX, a genus of plants of the natural order *Cyperaceæ*, of which the species are very numerous—more than 450—principally abounding in the temperate and colder parts of the world. More than 60 are natives of Britain. The English name SEDGE or SEC is sometimes employed as synonymous with C., but is popularly applied only to some of the species. This genus is distinguished by unisexual flowers, the male flowers with one glume, the female enclosed in a flask-shaped involucrum. Some of the species are plants of the very humblest growth, others are two or three feet in height; all are of unpretending, grassy, or rush-like appearance. Some grow in wet, and others in dry situations; some are of great value in the economy of nature, as forming the principal part of the vegetation of swamps, which they gradually convert into fertile ground. The

running roots, or rather *rhizomes*, of some help to bind the sands of sea-shores, particularly *C. arenaria*, which is carefully planted for this purpose on the

*Carex arenaria:*  
a, creeping rhizome, with  
flowering stems and spikes  
of flowers; b, a male flower,  
detached; c, a female flower,  
detached; d, a glume.

*Carex Vulpina:*  
a, a female flower.

dikes of Holland. None are valued by the agriculturist, as they are very deficient in nutritive quality, and in general they abound only in very inferior pastures, and good tillage and drainage lead to their speedy disappearance. The rhizomes of *C. arenaria*, *C. hirta*, and *C. disticha*, are sometimes used under the name of *German Sarsaparilla*, as a diaphoretic and demulcent medicine—a bad substitute for sarsaparilla. The two former are common in Britain. The dried leaves of *C. sylvatica* are used by the Laplanders to cover their legs and hands as a protection from frost-biting and chilblains, being worn in the inside of their shoes and gloves.

**CAREY,** WILLIAM, D.D., a distinguished minister and missionary belonging to the Baptist body, was born at Paulersbury, a village in Northamptonshire, August 1761. He served his time as a shoemaker, but began to preach about his 20th year. A pamphlet which he published about this time, attracted the attention of his co-workers in the ministry to the subject of Foreign Missions, and ultimately a missionary society, chiefly through C.'s exertions, was formed. C. and a Mr Thomas were chosen its first missionaries to India in 1793. From that time until his death in 1836, C. was indefatigable (under many difficulties, especially in his early years) in his efforts to spread the knowledge of the gospel among the heathen. Under his direction, the Serampore mission, of which he was the principal founder, had up to 1832 issued above 200,000 Bibles, or portions thereof, in about forty Oriental languages or dialects, besides a great number of tracts and other religious works in various languages. A great proportion of the actual literary labour involved in these undertakings was performed by C. himself, whose Sanscrit and other grammars have been highly spoken of by the late Mr Wilson Boden, professor of Sanscrit at Oxford. C. was professor of Oriental Languages at Fort William College, Calcutta, from 1800 to 1830.

614

**CAREY, HENRY C.**, a political economist of the United States, born at Philadelphia in 1793. In 1836, he published an essay on the *Rate of Wages*, which was expanded into the *Principles of Political Economy* (1837—1840). The value of this work may be estimated from the fact, that no less an authority than Frederic Bastiat copied its leading ideas. It was translated into Italian and Swedish, and favourably noticed in all the important politico-economic journals of Europe. In 1838, C. published *The Credit System of France, Great Britain, and the United States*; and in 1848, *The Past, the Present, and the Future*, a production marked by great vigour and originality of thought, and which endeavours to controvert the leading doctrine of Ricardo, Malthus, &c. In 1853 appeared the *Slave Trade*, and *Letters on the International Copyright*; and in 1858, the first and second volumes of his *Principles of Social Science*. As regards copyright, he opposes any international arrangement to check piracy, of which, for the special benefit of certain American publishers, he may be said to be the advocate.

**CA'RGO** is a general name for all the merchandise carried on board a trading-ship. Sometimes it is applied also to the invoice of the cargo. The term *deck-cargo*, is given to the commodities on deck, which are not usually included in the policy of insurance.

For the security of the Customs' revenue, the master of every coasting-vessel is bound to keep a *cargo-book*, recording the name of the vessel, the name of the owner, the port of departure, the port of destination, the goods taken, the names of the shippers and consignees, the time of departure, and other particulars. The Custom-house officers may demand to see this book at any time. The C. of passenger-ships is placed, in some degree, under the control of the emigration officers by an act passed in 1852.

**C'RIA**, in ancient geography, the southwesternmost country of Asia Minor, bounded N. by Lydia, E. by Phrygia, S.E. by Lycia, and W. and S.W. by the Mediterranean. A large portion of what was C. is mountainous. The chief ranges were called the Cadiamian and the Latmian. The most important river was the *Meander*, famous for its windings. C. was, at an early date, governed by petty princes or kings; it afterwards became a part of the Persian empire, the former princes continuing to rule as satraps; and it subsequently came into the hands of the early Macedonian kings of Egypt; and finally, with the rest of Asia, into those of the Romans. Among the chief towns were Cnidus, Halicarnassus, and Miletus.

**CARIA'CO**, a seaport of Venezuela, at the mouth of a river, and at the head of a gulf of the same name. It is 40 miles to the east of Cumana, in lat. 10° 30' N., and long. 63° 40' W. Pop. 7000. The gulf, long and narrow, with good anchorage, and well-wooded shores, is open only on the west, and that to a portion of the Caribbean Sea, which is itself breasted by a chain of islands.

**CARIACOU, CARJACOU, or VIRGINIAN DEER** (*Cervus Virginianus*), a species of deer found in all parts of North America, from Mexico to about N. lat. 43°, and from the Atlantic to the Pacific Ocean. It is the species commonly called Deer by the Anglo-Americans. It is smaller and more elegant than the common stag; of very variable colour—light reddish brown in spring, slate blue in autumn, and dull brown in winter; the belly, throat, chin, and inner parts of the limbs white. The horns of the adult male are of moderate size, bent strongly backward, and then suddenly

forward, so as to bring their tips nearly above the nose; they have several snags. The fawn is profusely decked with white spots, arranged in lines, and sometimes running into stripes. The name C. is extended generically to several nearly allied species, found in Mexico, California, &c.

**CARIA'MA** (*Microdactylus cristatus*), a bird of the order Gralla, allied to the cranes, but exhibiting also points of strong resemblance to gallinaceous birds, among which it has therefore been proposed to rank it, next to the guans. It is a native of Guiana, Brazil, and Paraguay, inhabiting open plains and the outskirts of forests, where it feeds chiefly on serpents, lizards, and insects. It is larger than the common heron; the plumage is brown, finely waved with darker brown, whitish on the lower parts. When pursued, the C. seeks safety by running, and does not readily attempt to use its wings. Its voice resembles that of a young turkey. It is much esteemed for the table, and it is sometimes reared in a domesticated state.

**CARIBBEAN SEA**, the grandest inlet of the western hemisphere—corresponding, in several respects, to the Mediterranean in the eastern—is separated from the Gulf of Mexico by Yucatan, and from the Atlantic Ocean by the great arch of the Antilles, between Cuba and Trinidad inclusive, stretching in N. lat. from about 8° to about 22°, and in W. long. from about 61° to about 89°. The C. S. forms the turning-point in the vast cycle of waters known as the GULF STREAM (q. v.), that wheels round, with the regularity of time itself, from Southern Africa to Northern Europe. It pours its waters into the Gulf of Mexico on the west, which shoots forth, on the east, the Florida Stream with the computed volume of 3000 Mississippi. To supply this enormous efflux, the C. S. draws on the Atlantic, laying under contribution nearly all the trade-wind regions of that ocean, so as literally to become the receptacle of the Amazon and the Orinoco. To the British Isles, it is, in this connection, an object of peculiar interest. Rendering still warmer the warm floods which it concentrates, it imparts to the Florida Stream that high temperature which tends, with the aid of the prevalent winds, to mitigate climate from Guernsey to Shetland. In common with the islands of its eastern boundary, the C. S. takes its name from their now extinct aborigines, the Caribs.

**CARIBBEE BARK**, or PITON BARK, is the bark of *Eccremoma Caribeum*, a small tree which grows in the West Indies and in Mexico, and belongs to the natural order *Cinchonaceæ*. The genus *Eccremoma* is very nearly allied to *Cinchona*, from which it differs in having the stamens exerted, whereas in *Cinchona* they are included within the corolla. *E. Caribeum* has ovate lanceolate leaves, and is known in the West Indies as the *Sea-side Beech*. C. B. has a very bitter taste, and a very faint smell. It contains none of the characteristic alkaloids of cinchona, yet very much resembles it in some of its properties, and is one of the barks sometimes substituted for the true cinchona barks.

**CARICA.** See PAPAW.

**CARICATU'RE** (Ital. *caricatura*, from *caricare*, to load or overcharge). The etymology of this word indicates its meaning very distinctly, which is that of a representation of a face, form, or character, in which the salient features are exaggerated or overloaded, to the extent of producing a ludicrous effect, without entirely, or even essentially destroying the resemblance. C. may be regarded as the opposite of idealisation; the former consisting in a disproportionate development of some, very frequently of one only, of the characteristics of the

subject treated, the latter in a proportionate elevation of them all. Nay, further, the destruction of harmony is essential to C., and where harmony is the prevailing quality of its subject, the required effect may frequently be produced by this means alone; whereas harmony belongs of necessity to idealisation, and where its absence was the characteristic defect of the object as a real existence, an ideal of a humble kind may frequently be produced by simply restoring it.

When used with reference to sensible representation, C. stands, to the genuine productions of the plastic and pictorial arts, in the same relation in which farce stands to the legitimate drama. Both C. and farce are thus degenerate forms of art; and though requiring much cleverness for their successful execution, and often affording lively satisfaction to the spectator, can scarcely be said in general to have an elevating object, or any other tendency than to amuse. When used as ancillary to well-directed and merited satire, C. assumes a nobler character, and it is to the credit of our nation that it is so frequently thus employed in our ephemeral literature. The best examples of C. which have ever appeared in the literature of any people, are to be found in the pages of *Punch*.

**CARIES** (*rotteness*) is a disease of bone analogous to the ulceration of soft tissues. It is characterised by a gradual loss of substance, from the particles of bone being absorbed, or being cast off and waahed away in a purulent discharge. It begins as an unhealthy inflammation, followed by exudation of new materials, and softening of the part affected. On examination, the bone-cells are found filled with a reddish glairy fluid, and in scrofulous patients, deposits of tubercle. After C. has existed for some time, an abscess forms, and bursts; its aperture remains open, discharging a thin fluid, which contains particles of the bone. If a probe be passed through this opening, it will be felt to sink into some soft gritty substance; this is the carious bone, which, if removed, and well washed, will be found to resemble in whiteness and fragility loaf-sugar softening in hot water.

C. may attack any bone, but it usually selects the vertebrae, those of the wrist and foot, and the soft ends of long bones forming joints. To this terrible disease most deformities, not congenital, are owing. The carious vertebrae yield under the weight of the trunk, and the spine curves forwards, or to one side. In the joint-ends of bones, the part enlarges, the cartilages become affected, matter forms, and amputation of the limb, or excision of the joint, is frequently necessary to save the patient's life. Too often the disease recurs with night-sweats, hectic, and death.

The causes of C. are constitutional, though it may be accidentally determined to some particular part of the body by any irritation, such as a blow, or exposure to atmospheric changes. Scrofulous persons, and those who have had syphilis or mercury in excess at any period of their lives, are more subject to it than others. If affecting a small bone, the latter may be entirely removed; and if the disease is strictly limited to the ends of bones forming a joint, these may be excised. Within the last thirty years, great advances have been made in this department of surgery, and C. of the joints is but seldom counted a sufficient reason for amputation; the knee, hip, shoulder, elbow, ankle, and wrist joints have all been repeatedly excised successfully in this country. In situations where the part cannot be reached by instruments, lotions of dilute acid may be injected, with the view of stimulating the carious surface to assume a healing action.

The treatment of C. consists in supporting the patient's strength by judicious change of air, and tonics, with the administration of medicines, such as cod-liver oil in scrofula, which appear to combat the constitutional predisposition to the disease. In those parts where the diseased bone can be reached, it should be gouged or scraped away, so as to leave a healthy surface of bone, which may granulate up, and heal.

**CARIES OF THE TEETH** depends, it is supposed, on an original faulty formation of their substance, when, after any depressing cause, especially in scrofulous and ill-nourished persons, they soften and crumble away, at last laying open the cavity which contains the nervous pulp of the tooth, and producing toothache. *Treatment.*—The carious surface should be removed, and, as a substitute for the lost substance, gold or some other substance should be stuffed into the cavity. If the pulp be exposed, the hole should be stuffed with some softer material, till the parts are somewhat hardened; for this, Mr Tomes of London recommends a plug of cotton-wool dipped in a mixture of mastic, a drachm, and rectified spirit or Eau-de-Cologne, an ounce and a half; or of gutta-percha dissolved in chloroform.

**CARIGNA'NO**, a town of Piedmont, in the province of Turin, about 11 miles south of the city of that name. It is situated near the left bank of the Po, in the midst of a most beautiful country; has some fine churches, manufactures of silk-twist, and a population of 7712. This town gives name to a branch of the House of Savoy.

**CARRILLON.** See **BELL**.

**CARIMA'TA**, a name applied to the passage between Borneo and Billiton; also to a cluster of islets in the same passage; and lastly, to the principal member of the group, whose highest point, a peak of 2000 feet, is in lat. 1° 36' S., and long. 108° 54' E.

**CARINA'RIA**, a remarkable and interesting genus of gasteropodous mollusks, of the order called *Heteropoda* or *Nucleobranchia*, having a thin shell, in form somewhat like that of a limpet, which, however, only covers the visceral sac (heart, gills, &c.), leaving the greater part of the animal exposed. The shells of some of the species have been sometimes denominated *Venus's Slipper* and *Glass Nautilus*. The body is gelatinous, and so transparent that much of its interior organization can be seen. Nearly opposite to the part of the back occupied by the shell is a sort of vertical fin, answering to the foot of the other gasteropods. The species of C. are all marine, are found only in the seas of the warmer latitudes, and generally swim with the back downward. Closely allied to C. is the genus *Fivola*, in which there is no shell at all.

**CARINI**, a town of Sicily, in the intendancy of Palermo, and 12 miles west-north-west of the city of that name. It has an old castle; and a population of 9300, chiefly engaged in fishing.

**CARINO'LA**, a town of South Italy, in the province of Caserta, 20 miles south-east of Gaeta. It has a cathedral, and a Franciscan convent. The district produces excellent wine. Pop. 6620.

**CARINTHIA** (Ger. *Kärnthen*), a crown-land of the Austrian empire, forming part of the old kingdom of Illyria, with an area of 3958 square miles, and a population, in 1869, of 337,694, which is rather less than what it was in 1854. The principal river is the Drave, which passes through the country from

west to east, in a course of almost 150 miles. The general aspect of the country is mountainous, with long deep valleys, that of the Drave widening at Villach and Klagenfurt into a great plain. The valley of the Drave divides the *Noric* from the *Carinthian Alps*. Agriculture is carried on to a limited extent, owing to the mountainous character of the country, great part of which is occupied in pasture, or covered with brush-wood. Many horses and cattle are reared and exported. The principal products are mineral. One of the principal branches of industry is the manufacture of hardware; the other manufactures include woollens, silk stuffs, and cottons. The capital is Klagenfurt.—The ancient inhabitants were the *Carni*, who derived their name from the Celtic word *carn* or *corn*, Lat. *cornu*, Eng. *horn*—an allusion to the craggy, horn-like pinnacles of their hills. Before the time of Augustus, it belonged to *Noricum*, afterwards to the Roman empire. By and by the *Carni* were swept away in the deluge of immigration from the east, and Slaves settled in the country. After some time the Slaves themselves were so heavily oppressed by the Avari, that they called to their assistance a Frank, named *Samo*, who founded the kingdom of *Carantanica*, which included much more than the present C., but fell to pieces after his death. Charlemagne added C. to the empire of the Franks, and made it a markgrafdom. Finally, it came into the possession of Austria (q. v.).

**CARISSA**, a genus of plants of the natural order *Apocynaceæ*. *C. Carandas* is a thorny shrub, much used for fences in India; and the fruit, called *carandas*—a berry about the size of a small plum—for tarts and preserves.

**CARLEN**, EMILIE, a well-known Swedish novelist, was born, 1810, in Stockholm, or, as some say, 1807, at Strömstad. Her maiden name was Schmidt or Smith. During childhood, her talent in imaginative fiction was remarked by her friends; but it was not till 1838 that her first novel, *Waldemar Klein*, was given to the world. She was then a widow, having been married, in 1827, to M. Flygare. In 1841, she was again married to J. G. Carlen, a lawyer, and known as a poet, in Stockholm. Her literary productiveness has been very remarkable, her fictions being chiefly founded on the characteristics of the lower orders in Sweden; and, although faulty in many respects, they are especially rich and striking in incident; and her characters, without exhibiting any very deep insight or subtle analytic power, are yet intelligible and consistent. Among her many works, which have been translated into English, are *The Rose of Thisteland*, *The Birthright*, *The Hermit*, *The Events of a Year*, *The Lover's Stratagem*, *Gustavus Lindurm*, *The Maiden's Tower*, *Woman's Life*, &c. Her works are largely circulated both in Europe and in America.

**CARLETON**, WILLIAM, one of the most popular writers of tales describing Irish life and manners, was born, 1798, at Prillisk, in the county of Tyrone, Ireland. Bred and educated among the peasantry, he passed through the common sufferings and privations of Irish poverty, and, after receiving some scanty instruction in a hedge-school, he, in his 17th year, went to an academy which a relative had opened at Glasalough, where he remained two years. Afterwards, a vague ambition led him to Dublin, where he arrived with only some three shillings in his pocket, and where, in 1830, he published his *Traits and Stories of the Irish Peasantry*. Their freshness of style pleased the public, and won the favour of critics. A second series, issued in 1832, was also well received; and, in 1839, he published

a powerful story, entitled *Fardorougha the Miser*, in several passages of which, however, his humour becomes extravagant. Subsequently, C. published a series of tales (3 vols., Dub. 1841), mostly of pathetic interest, but including a very genial and humorous sketch of the *Misfortunes of Barney Branagan*, which proved a great favourite. The story of *Valentine M'Clutchy* is half-political and half-religious in its tendency, defending the Irish Catholic priesthood, and advocating repeal of the Union; it appeared in 1845. Other narratives—*Rody the Rover*, 1846; *The Black Prophet*, 1847; and *The Tithe Proctor*, 1849—contain many proofs of the author's genius. *Wiley Reilly*, 3 vols., appeared in 1855, and *The Evil Eye* in 1860. C. is the true historian of the Irish people. Sharing in their qualities of mind and temperament, he has a true sympathy with all their joys and sorrows, and a graphic and picturesque pen with which to describe them. In consideration of his literary services, he enjoyed a government pension of £200 a year, and on his death in January 1869, the queen granted a pension of £100 to his widow.

CARLI, GIOVANNI RINALDO, a distinguished Italian economist and archeologist, was born at Capo d'Istria, April 1720. Educated at home and at Flambro in the Friuli, he was, in his 24th year, appointed professor of astronomy and navigation at Padua. In 1754, he published the first volume of his great work *On the History of the Coins and Currency, and on the Institution of the Mints of Italy*, the fourth and last volume of which appeared six years later. The book treats of the monetary history of Italy from the fall of the Western Empire until the 17th c., and is profusely illustrated with representations of coins, national and foreign, circulating in Italy during the various ages; and their value as compared with the price of provisions at different periods is also calculated. His merits as a financier were not overlooked. He was made President of the Council of Commerce and Public Economy at Milan, and afterwards President of the New Council of Finances, into which branch of administration he introduced many admirable reforms. The inhabitants were also indebted to his influence for the abolition of the Inquisitional Tribunal. He also wrote some valuable works on Istrian and other antiquities; dissertations on classical subjects; against sorcery; against Rousseau's theory of natural religion, &c. He died February 1795. His works, exclusive of his *Italian Antiquities*, were published in 19 vols. 8vo (Milan, 1784—1794).

CARLINE THISTLE (*Carlina*), a genus of plants of the natural order *Composita*, closely allied to the true Thistles, from which they are distinguished by the inner scales of the involucle spreading like rays, and being coloured and shining. These involucral scales are remarkably hygrometric, expanding in dry and closing together in wet weather, and this property they retain for a long time; the heads of flowers are therefore often nailed on cottage-doors in many parts of Europe, to indicate the weather. The name C. T. is derived from a legend, that an angel shewed the root of one of the species to Charlemagne as a remedy for a plague. This species, *C. acaulis*, grows on hills and mountains, especially in calcareous soils in the middle latitudes of Europe. It has a very short stem, and very large heads of flowers, and was formerly in high repute for the medicinal virtues of its root—which is in large doses a drastic purgative—but its use is now almost confined to veterinary practice.—The only British species is the common C. T. (*C. vulgaris*), not unfrequent in England and some parts of Scotland, and sometimes rather a troublesome weed, but always indicative of a

poor soil. It has a stem about a foot high; and many purplish heads of flowers set amidst straw-coloured rays.

Carline Thistle (*Carlina acaulis*).

CA'RLINGS, in Ship-building, are small beams laid fore and aft, and resting upon the main or deck beams. These, with other pieces called ledges, laid at right angles to them, form a framework by which the deck is supported.

CARLISLE, a parliamentary and municipal borough, episcopal city, and ancient town in North Cumberland, the capital of the county, 12 miles east of the Solway Firth, 300 miles north-west-by-north of London, 101 miles south of Edinburgh, and 60 west-south-west of Newcastle. It is a chief station on the west railway route from London to Edinburgh, and is the terminus of seven different lines of railway. It stands on an eminence in a wide plain at the confluence of, and nearly surrounded by, the Eden, Caldew, and Peteril. Many fine new streets and buildings have been lately added to the city. The chief branches of industry are cotton, gingham, and check manufactures; print, iron, and dye works; and salmon-fisheries. It has a small cathedral of red freestone, of which Paley was archdeacon. The castle was founded in 1092, and is now a barracks; the remains of the keep form a massive lofty tower, with a very deep well. Mary Queen of Scots was confined in the castle after the battle of Langside. A canal of 11 miles, from Bowness on the Solway Firth to C., formerly admitted vessels of 100 tons; but the bed of the canal has now been converted into a railway, from which a line also branches to the newly formed port of Silloth, where an extensive dock has been constructed on the Solway, at a distance of 20 miles from Carlisle. Pop. in 1763, 4000; 1801, 10,221; 1851, 26,310; 1861, 29,417; 1871, 31,049. C. returns two members to parliament. The total number of vessels that entered the port of C. in 1872 was 440, of 91,482 tons; cleared 735, of 114,826 tons. Roman remains have been found here—coins, altars, inscriptions, brass incense vases, &c. Being near the west end of Hadrian's Wall, C. was probably a Roman station. It was the seat of the ancient kings of Cumbria. The Picts and Scots ravaged it. About 900, it was destroyed by the Danes, after which it remained desolate for 200 years. Thence to the union of England and Scotland, it was closely connected with the border wars, and underwent many sieges. To its being long a fortified border town it owed much

## CARLISLE—CARLOS DE BOURBON.

of its importance and privileges, but it declined much after the union. The C. corporation, in 1745, proclaimed Prince Charles king of Great Britain. The Duke of Cumberland afterwards took the city, and punished the chief actors with death, and the inhabitants with other cruelties. In 1133, Henry I. made C. a bishopric.—The C. Tables of Mortality, based on the deaths which occurred in C. 1778—1787, were drawn up by Dr Heysham, and have been ever since much used by life-insurance offices, as being nearest the average.

CARLISLE CATHEDRAL was commenced about 1092 by Walter, a Norman. It was founded by William Rufus, and dedicated in 1101 by Henry I.; and in 1133, was made the cathedral church of the newly formed diocese. A great part of the original Norman building was destroyed by fire in 1292. The new edifice contains specimens of all the styles of early English—simple pointed, geometric, and flowing. Two-thirds of the fine Norman nave, originally 141 feet long, were destroyed by Cromwell; the portion that was left has long been used as a parish church. In 1853, the restoration was commenced. The choir is one of the finest in England, 138 feet long, and 72 high, and consists of 8 pointed arches. The east window, consisting of 9 lights, is considered the finest decorated window in England. The tower is very low, rising but one story above the choir. It formerly supported a timber spire, which was removed in 1661. This cathedral has four canons.

CARLISLE, GEORGE WILLIAM FREDERICK HOWARD, EARL OF, K.G., was born April 18, 1802. Educated at Eton and Oxford, he, in 1821, obtained the Chancellor and Newdegate prizes for his Latin and English poems. He entered the public service in 1826 as an attaché. In 1830, he (then Lord Morpeth), along with Henry (now Lord) Brougham, was elected one of the representatives of the important constituency of Yorkshire, and after the Reform Bill for the West Riding, a position which he held in the liberal interest for several years. Under the administration of Lord Melbourne, he held the office of chief secretary for Ireland (1835—1841), and his impartial distribution of patronage made him very popular in Dublin. Rejected in 1841 by the West Riding, he was again elected in 1846, and remained one of its representatives until the death of his father (1848) called him to the House of Lords. Under Lord John Russell's ministry (1846—1852), he was Chief Commissioner of Woods and Forests, and afterwards Chancellor of the Duchy of Lancaster. When Lord Palmerston was made prime minister in 1855, C. was appointed Lord Lieutenant of Ireland, a post which he held until the advent of the Earl of Derby's government in 1858; and he succeeded to the same office again when Lord Palmerston was reinstated in 1859. C. obtained some reputation as a literary man, chiefly by his lectures on his travels in the United States, on the life and writings of Pope, and his *Diary in Turkish and Greek Waters*. He died in 1864.

CARLOS, DON, Infante of Spain, born July 3, 1545, at Valladolid, was the son of Philip II. After his recognition as heir to the throne, in 1560, Don C. was sent to study at the university of Alcalá de Henares; where, however, he profited so little, that the king, regarding him as unqualified to reign, invited a nephew, the Archduke Rudolf, to Spain, intending to make him heir to the throne. Excluded from all participation in the government, Don C. conceived a strong aversion toward the king's confidants, and especially was unwilling that the Duke of Alva should have the government of Flanders. In confession to a priest, on Christmas

eve 1567, he betrayed his purpose to assassinate a certain person; and as the king was believed to be the intended victim, this confession was divulged. The papers of Don C. were seized, and being tried, he was found guilty of conspiring against the life of the king, and of traitorously endeavouring to raise an insurrection in Flanders. The sentence was left for the king to pronounce. Philip declared that he could make no exception in favour of such an unworthy son; but sentence of death was not formally recorded. Shortly afterwards, he died, July 24, 1568, and was interred in the Dominican monastery, El-Real, at Madrid. The suspicion that he was poisoned or strangled, has no valid evidence to support it. Schiller, in his tragedy *Don Carlos*, has widely departed from historical testimony.

CARLOS DE BOURBON, DON MARIA ISIDOR, born March 29, 1788, was the second son of Charles IV. of Spain, and was educated chiefly by priests. After the expulsion of the French from Spain, his brother, Ferdinand VII., reascended the throne; but having married thrice without issue, Don C. began to cherish the hope of succeeding his brother. An insurrection in his interest broke out in 1825, in Catalonia; but was put down, Don C. himself not participating in it. A fourth time, however, the indefatigable Ferdinand married, and the result was a daughter, the Infanta Maria Isabella (late queen of Spain), born October 10, 1830. Now, as the Salique Law, excluding females from succession to the throne, had been abrogated, the hopes of the Carlists, as the followers of Don C. were called, were destroyed. During the illness of the king, in September 1832, the Carlists succeeded so far as to win from him a re-institution of the Salique Law; but he revoked it again as soon as he had partially recovered, and thus Don C. was again disappointed. As he still continued his agitation, he was banished, in 1833, to Portugal, and, soon afterwards, was commanded to reside in the Papal States. But before C. had embarked for Italy, King Ferdinand VII. died, September 29, 1833. Don C. was now recognised as heir to the throne of Spain, not only by the Carlists but also by Dom Miguel in Portugal; and having refused to obey the queen-regent's order for his deportation to Italy, he was declared a rebel, October 16, 1833. By the quadruple alliance of Spain, Portugal, England, and France, both C. and Dom Miguel were banished from Portugal, and in June 1834, the former embarked for England. In the following month, he returned to the continent, passed in disguise through Paris, and travelled through Bordeaux and Bayonne, into Spain, where he excited an insurrection in the northern provinces, but was ultimately compelled to escape into France. In 1836, his claims to the throne were unanimously rejected by the Constituent Cortes. Subsequently, Don C. lived for some time at Bourges, in France, where he kept up the pompous etiquette of the Spanish court. In 1844, he abdicated in favour of his eldest son, also named Don Carlos; and in 1847 he was permitted to retire to Trieste, where he died, March 10, 1855.—DON CARLOS, his son, born 1818, was better known as the Count de Montemolin. This second pretender made an attempt, in 1849, to pass under a disguise through France into Spain, but failed, and was imprisoned for a few days in the citadel of Perpignan. In 1860, a Carlist insurrection was once more attempted, in consequence of which the Count de Montemolin and his brother were arrested, but liberated after the former had signed a renunciation of all his claims to the Spanish throne. He died in 1861. The representative of his pretensions (1874) is his nephew, Don Carlos, son of his brother Juan, born 1848.

**CARLOVINGIANS**, the second dynasty of Frankish kings. The origin of the family is traced to Arnulph, Bishop of Metz, who died in 631. His son, Anséglise, married a daughter of Pepin, of Landen, in Austrasia. His sons, Martin and Pepin d'Heristall (q. v.), as the greatest territorial lords in Austrasia, were called to the office of Mayor of the Palace. Martin was assassinated; Pepin, by force of arms, compelled the weak Merovingian king, Theodoric III., to invest him with the office of Mayor of the Palace in all the three Frankish states, Neustria, Austrasia, and Burgundy. Pepin allowed the Merovingian kings to remain upon the throne, but they were kings only in name. He died on 17th December 714, and left as his successor, his young grandson, Theodoald; but Charles Martel (q. v.), a natural son of Pepin, was made Mayor of the Palace by the Austrasians, and in this capacity subjected the three states to his power. He died in 741. His two sons, Carloman and Pepin le Bref, divided the kingdom, although for a time the nominal Merovingian dynasty still subsisted; but Pepin at last formally assumed the royal power, and was crowned King of the Franks on 3d May 752. This is the formal commencement of the Carlovian dynasty. Pepin began the conquest of Italy. His sons, Carloman and Charles the Great or Charlemagne (q. v.), succeeded him, of whom the latter soon reigned alone, and prodigiously extended his dominions. In 800, Pope Leo III. set upon his head the crown of the Western Roman Empire. He divided his dominions amongst his sons, of whom, however, only one, Louis le Débonnaire, survived him, who, in the list of the kings of France, appears as Louis I., but who was properly Emperor and King of the Franks. With Charlemagne, however, the high abilities of his family suddenly disappeared, and his successors shewed much weakness of character. Family feuds broke out during the life of Louis le Débonnaire, who had divided his dominions in part amongst his sons, and he terminated an inglorious reign in 840. By a treaty concluded in August 843, Lotharius I., the eldest son of Louis, obtained the imperial crown and the kingdom of Italy, with Lorraine, Franche Comté, Provence, and the Lyonnais; Louis, his brother, called Louis the German, obtained the German part of his father's dominions; and Charles the Bald, the son of a second marriage, obtained Neustria, Aquitania, and the Spanish March, and may almost be regarded as the founder of the French monarchy. The Emperor Lotharius I. died in 855, and his dominions were again divided—his eldest son, Louis II., being Emperor and King of Italy, and his two other sons kings of Lorraine and of Provence, but their kingdoms reverted to the emperor.—Charles the Fat, a son of Louis the German, having become emperor, was elected by the French nobles to be their king in 882; and being previously in possession of Italy and Germany, united under his sway great part of Charlemagne's empire. But he was a weak monarch, and was deposed in 887. The imperial dignity passed by the marriage of the daughter of the Emperor Arnulph with Fritzar, Count of Franconia, to another family. The French dynasty, of which Charles the Bald may be deemed the founder, continued in a succession of weak monarchs for about a century, till it terminated with the reign of Louis V., on whose death, Hugh Capet, the most powerful nobleman in France, seized the crown in 987. The Carlovian kings had for some time previous possessed no real power. A subsequent marriage, however, connected their family with that of the Capets, and enabled the kings of France to trace their descent from Charlemagne.

The Carlovian dynasty figures in the early history of France as the ally of the church. It aided the popes against the Lombards; made war on the Aquitanians, who pillaged and despoiled the churches; established the temporal power of the successors of St Peter; subdued and converted the still pagan Saxons; and fought the Mohammedans in Spain. Now, on the other hand, do we find the church ungrateful: it sanctioned, by benediction and prayer, the conquests of this powerful family; in various ways impressed its sacred stamp of approbation upon it; and for its sake resuscitated the imposing idea of an empire of the west. But this alliance, which was advantageous to the policy of kings like Pepin le Bref and his son Charlemagne, because they had genius, vigour, and design, became at a later period, under their feeble successors, a chief cause of the overthrow of the dynasty, for the clergy after 814 grew stronger and more exacting every day, and forced the monarchs to new concessions.

**CA'RLOVITZ**, or **KA'RLOVITZ**, a town of the Austrian empire, in the military frontier of Slavonia. It is situated on the right bank of the Danube, about 8 miles south-south-east of Peterwardein, and is noted for its excellent wine, and for the treaty concluded here in 1699. The wine—especially the red variety—ranks with the best and strongest obtained in Hungary, and in some years the product has amounted to about 1½ million of gallons. Pop. (1869) 4419. The important treaty or peace of C. was concluded, in 1699, between the allies Austria, Russia, Poland, and Venice on one side, and the Porte on the other, and included the following articles: 'That Austria should repossess the territories captured by the Turks during two centuries (which included Hungary and Slavonia, and she also acquired Transylvania); that Venice should hold the Morea as far as the isthmus; that Poland should take back Podolia and the lands in the Ukraine conquered by Mohammed IV., but should cede certain places in Moldavia; and that Russia should have the territory of Azof.'

**CARLOW**, the capital town of Carlow county, Ireland, situated at the confluence of the Burren and the Barrow, 56 miles south-west of Dublin by rail. It is a well-built town, with two principal streets, from which branch many smaller ones, and a suburb, Graigue, in Queen's County, on the opposite side of the river, with which it is connected by a bridge. It has a Roman Catholic cathedral and divinity college. C. has extensive flour-mills, and is the emporium for the agricultural produce of the district, which is largely exported from this place. Pop. 7778. It returns one member to parliament. There are here the remains of a castle, picturesquely situated on an eminence on the Barrow, founded in 1180 by Sir Hugh de Lacy. In 1361 the Duke of Clarence established the Exchequer of the kingdom in this place. It constituted one of the boundaries of the PALE, beyond which the king's writ was not recognised by the 'Irishry.' Its first charter was granted in the 13th c. by William Marshall, Earl of Pembroke. The town grew up around this castle, which was several times besieged by, and alternately in the possession of, the English and Irish. The castle (one of great extent) was in the possession of the insurgents in 1650, when it was closely invested by General Ireton and the republican army. The garrison surrendered on conditions to Sir Hardress Waller, whom Ireton had left to conduct the siege. It was then dismantled; and about one-half of this once stately castle now remains a picturesque ruin. In the Irish insurrection of 1798, the insurgents attacked the town, but were repulsed by the

garrison and yeomanry, and 600 of them killed. The Barrow is here navigable for small-craft to its junction with the Grand Canal at Athy.

CARLOW, a small inland county of Ireland, in Leinster province, with an area of about 346 square miles, of which  $\frac{1}{3}$ ths are arable. C., except in the southern extremity, where it is hilly, is a triangular fertile level, or gently undulating plain, between the Wicklow and Wexford range of hills on the east, and the highlands beyond the Barrow on the west. The chief rivers are the Barrow and Slaney. C. consists chiefly of granite, covered in the middle plain, or richer tracts, by limestone gravel, on which are fine loams and pasture. In the uplands, the soil is gravelly. Lower, carboniferous limestone crops out in the valley of the Barrow. On the west side of the county begins the great coal district of Leinster. In 1873, 79,416 acres were under crop, the chief crops being oats, potatoes, barley, and wheat. There are many dairies on the plains. The chief exports are corn, flour, meal, butter, &c. Along the Barrow, which falls above a foot per mile, are a great many extensive corn-mills. Pop. 1841, 86,228; 1851, 68,059; 1871, 51,472. It returns three members to parliament—two for the county at large, and one for the borough of Carlow. The chief towns are Carlow, Tullow, and Bagenalstown. At Old Leighlin a synod was held in 630, to settle the time of Easter. Several engagements occurred in the county during the Irish rebellion of 1798. The chief antiquities of C. are cromlechs, castles, and the cathedral church of Old Leighlin. A cromlech near Carlow town has a covering stone 23 feet long, and of nearly 90 tons.

CA'RLSBAD, or KAISER-KARLSBAD, a town in Bohemia, much celebrated for its hot mineral springs, and frequented in summer by visitors of the most aristocratic character from all parts of Europe. The permanent population does not amount to more than about 4000, who mostly live by services rendered to the visitors, or by making articles of various kinds, chiefly of Bohemian glass, to be sold to them. The visitors in a season, which usually lasts from 15th June to 15th August, amount to 5000 or 6000. The wells have been frequented from a very early period, but have been of great celebrity since the 14th century. The scenery is extremely beautiful. The town is well built, the accommodation for guests good, and the place free from some of the abuses too common at other German spas. No gaming-houses exist here. The temperature of the hot springs varies from 117° to 165° Fahrenheit. The principal spring, the Sprudel, has a very large volume, and is forced up to a height of 3 feet from the ground. Altogether, the daily flow of the springs of C. is estimated at 2,000,000 gallons. The principal ingredient in the water is sulphate of soda. The whole town of C. appears to stand on a vast caldron of boiling water, which is kept from bursting only by the safety-valves the springs provide. On one occasion, after an explosion, poles of 30 fathoms in length, thrust into the aperture, did not reach the bottom. A congress of German powers was held here in August 1819, in which various resolutions, denunciatory of a free press and liberal opinions, were arrived at, and measures of repression determined on.

CARLSBURG, or KARLSBURG, a town of Transylvania, situated on the right bank of the Maros, here crossed by a bridge some 200 yards in length, 48 miles south of Klausenburg. It is built partly on a hill, and partly in a valley, is fortified, and has a citadel surrounded by walls with bastions. Gold and silver, obtained from the mines of Transylvania, are purified and coined here. The only

manufacture of importance is saltpetre. Maros Porto, the chief shipping-place for Transylvanian rock-salt, is within half a mile of the town. C. occupies the site of the ancient *Apulum*, remains of which are still found. Pop. (1869) 7955.

CARLSCRONA, capital of the province of the same name in Sweden, is situated on the rocky island of Trotsö, and its adjoining islets in the Baltic, which are connected by bridges, in lat. 56° 9' N., long. 15° 35' E. The town was built in 1680 by Charles XI., who gave it his own name, and conferred upon it several important privileges, besides making it the great naval station and arsenal of Sweden, instead of Stockholm. It has a magnificent harbour, with a sufficient depth of water to float the largest vessels. The only practicable entrance for large ships is defended by two strong forts. The dry docks, blasted out of the granite rock at vast expense, are an attraction to strangers. The inhabitants are chiefly employed in connection with the arsenal. Pop. (1873) 16,392.

The province of C. or Bleking is situated in the south of Sweden, in lat. 56°—56° 30' N., long. 14° 30'—16° E. It has the Baltic on its south and east margins. It has an area of about 1130 square miles, with a population of 127,877. It is hilly without being mountainous, and generally fertile, yielding rye and potatoes abundantly, and also wheat, oats, and peas. The fisheries employ a considerable number of the inhabitants.

CARLSRUHE, the capital of the grand duchy of Baden, is situated a few miles eastward from the Rhine. It was founded by the Markgraf Charles William of Baden-Durlach, in 1715, and built on a curious and regular plan in connection with the palace, which constitutes the centre point from which the streets, so far as constructed, diverge in the shape of an extended fan. The streets are wide and well paved. There are a number of fine buildings; flourishing educational institutions; the Court Library contains 80,000 vols.; a public library, 90,000; and there are valuable collections of antiquities, objects of natural history, &c. An aqueduct from the Durlach supplies the town with water. In the market-place, which is the finest of the public squares, a stone pyramid encloses the remains of the founder of the city. The manufactures include jewellery, carpets, chemical products, cloth, carriages, tobacco, &c. C. is now one of the principal stations on the railway through the Grand Duchy of Baden. Pop. (1871) 36,622.

CA'RLSTAD, a town of Sweden, on the island of Tingvalla, in Lake Wenern, about 160 miles west of Stockholm. It is connected with the mainland by two bridges, one of which is a large and very handsome structure. The town is well built, has a cathedral, cabinet of natural history, &c., and commands extensive views of the most beautiful scenery. Its trade is large, consisting in exports of iron, copper, timber, and corn. Pop. between 4000 and 5000.

CARLSTADT, a town of Croatia, in Austria, situated in a rich plain between the rivers Kulpa and Korona, 33 miles south-west of Agram. It is fortified—the original fortress having been erected in the 16th c. to resist the Turks—has an old castle, and armoury of 30,000 stand of arms. It has a large garrison, the Austrian executive looking upon it as a place of considerable importance, on account of its position on a navigable river, and on the great road into the centre of Croatia from the coast. It has few manufactures, but an active transit trade. Pop. (1869) 5175.

CARLU'KE, a municipal burgh in the middle

of Lanarkshire, near the right bank of the Clyde, 6 miles north-west of Lanark. Pop. 3400. The neighbourhood is rich in coal, iron, and limestone, and mining is the chief industry of the place. The orchards around cover 130 acres. Not far off is Lee, the seat of the Lockharts, where is preserved the famous Lee Penny, noticed by Sir W. Scott in the *Talisman*. Roman coins have been found here. General Roy, the antiquary, author of the *Military Antiquities of the Romans in North Britain*, was a native of Carluke.

CARLYLE, THOMAS, was born 4th December 1795, in the town of Ecclefechan, parish of Hoddam, Dumfriesshire, Scotland. Educated first at the parochial school, and afterwards at Annan, he passed to Edinburgh University, with a view to entering the Scottish Church, in his 15th or 16th year. Here he studied irregularly, but with amazing avidity. The stories which are related of his immense reading are almost fabulous. About the middle of his theological curriculum, C. felt wholly disinclined to become a clergyman, and, after a short period spent in teaching at Dysart, in Fifeshire, he embraced literature as a profession. His first efforts were contributions to Brewster's *Encyclopædia*. In 1824, he published a translation of Legendre's *Geometry*, to which he prefixed an *Essay on Proportion*, mathematics having, during his college years, been a favourite study with him. In 1823—1824 had appeared in the *London Magazine* his *Life of Schiller*, and, during the same year, his translation of Goethe's *Wilhelm Meister*. In 1825, the *Life of Schiller* was recast, and published in a separate form. It was very highly praised; indeed, one can discern in the criticisms of the book certain indications of the genius of Carlyle. The translation of *Wilhelm Meister* met with a somewhat different fate. De Quincey, in one of his acrid and capricious moods, fell foul both of Goethe and his translator; while Lord Jeffrey, in the *Edinburgh Review*, admitting C. to be 'a person of talents' slashed in cavalier fashion at the book. In 1827, C. married Miss Welch, a lineal descendant of John Knox, and, during the same year, appeared his *Specimens of German Romance* (4 vols., Tait, Edinburgh). From 1827 to 1834, he resided chiefly at Craigenputtoch, a small property in Dumfriesshire, belonging to his wife—the 'loneliest nook in Britain,' as he says himself in a letter to Goethe, 'fifteen miles north-west of Dumfries, among the granite hills and the bleak morasses which stretch westward through Galloway almost to the Irish Sea.' Here C. revolved in his mind the great questions in philosophy, literature, social life, and politics, to the elucidation of which—after his own singular fashion—he has earnestly dedicated his whole life. Here, also, he commenced to write the splendid series of critical and biographical essays which first familiarised Englishmen with the riches of modern German thought. For this work, he was incomparably better fitted than any man then living in Great Britain. Possessing a knowledge of the German tongue such as no foreigner ever surpassed, he was also inspired by the conviction, that the literature of Germany in depth, truthfulness, sincerity, and earnestness of purpose, was greatly superior to what was admired and relished at home. Gifted, moreover, in a degree altogether unexampled, with a talent for portraiture, he soon painted in ineffaceable colour on the British memory, the images of Schiller, Fichte, Jean Paul Richter, and other foreign magnates, until then almost unheard of. Gradually, educated circles awoke to the fact, that a literary Columbus had appeared among them, who had discovered a 'New World' of letters, the freshness and grandeur of

which were sure to attract, sooner or later, multitudes of adventurous spirits. One of his most beautiful, eloquent, and solid essays written at Craigenputtoch, was that on *Burns* (*Edinburgh Review*, 1828). It has given the tone to all subsequent criticism on the Scottish poet. The article on *German Literature*, in the same periodical, is a masterly review of a subject, the importance of which C. at length succeeded in compelling his countrymen to acknowledge. But his *chef-d'œuvre*, written on his moorland farm, was *Sartor Resartus* ('The Tailor done over,' the title of an old Scottish song). This work, like all his after-productions, an indescribable mixture of the sublime and the grotesque, was offered to various London firms, and rejected on the advice of their sapient 'tasters,' and at length published in successive portions in *Fraser's Magazine* (1833—1834). It professed to be a history or biography of a certain Herr Teufelsdrückh ('Devil's Dirt'), professor in the university of Weismichtwo ('Kennaughair'), and contains the manifold opinions, speculations, inward agonies, and trials of that strange personage—or rather of C. himself. The whole book quivers with tragic pathos, solemn aspiration, or riotous humour. C. now removed to London, where he still resides. In 1837 appeared the first work which bore the author's name, *The French Revolution, a History*. Nothing can be more gorgeous than the style of this 'prose epic.' A fiery enthusiasm pervades it, now softened with tenderness, and again darkened with grim mockery, making it throughout the most wonderful image of that wild epoch. C. looks on the explosion of national wrath as a work of the divine Nemesis, who 'in the fulness of times' destroys, with sacred fury, the accumulated falsehoods of centuries. To him, therefore, the Revolution is a 'truth clad in hell-fire.' During the same year, he delivered in London a series of lectures on *German Literature*; in 1838, another series on *The History of Literature, or the Successive Periods of European Culture*; in 1839, another on *The Revolutions of Modern Europe*; and a fourth in 1840, on *Heroes, Hero-worship, and the Heroic in History*; of these only the last has been published. Meanwhile, the first edition of his *Miscellanies* (contributions to the reviews) had appeared in 1838, and his *Chartism* in 1839. In 1843 followed *Past and Present*, which, like its predecessor, shewed the deep anxious sorrowful interest C. was taking in the actual condition of his countrymen. In 1845, he published what is by many considered his master-piece—*Oliver Cromwell's Letters and Speeches, with Elucidations and a Connecting Narrative*. The research displayed in this book is something marvellous, but the author has been nobly rewarded for his toil, inasmuch as his vindication of the Protector's character is most triumphant. To C. has thus fallen the unspeakable honour of replacing in the Pantheon of English history the statue of England's greatest ruler. In 1850, the *Latter-day Pamphlets*, the fiercest, most sardonic, most furious of all his writings, came out. The violence of the language in these pamphlets offended many. Next year (1851) appeared the *Life of John Sterling*—a biography of intense fascination for the younger intellects of the age. The latest production of C. is *The History of Friedrich II. of Prussia—called Frederick the Great* (1858—1864), in 4 volumes. This work gives a graphic picture of Europe on the eve of, and during the Seven Years' War.

What position C. will ultimately occupy in the literature of his country, is not easy to determine. That his *genius* will never want ample recognition, is most certain; but his *writings* derive so much of their interest and power from what is peculiar to,

or at least characteristic of, the present time, that future ages may possibly wonder at their fiery splendours, and fail to sympathise with their prophetic enthusiasms.

CARMAGNOLA, a town of North Italy, situated near the left bank of the Po, about 16 miles south of Turin. It has a massive old tower, the remains of a very strong castle, which formerly served as a defence for the town. The *condottiere*, Francesco Busone, afterwards Conte di Carmagnola, was a native of this place. It has manufactures of jewellery, and a trade in silk, flax, linen, cattle, and agricultural produce. Pop. 12,512.

CARMAGNOLE, the name of a popular song and dance, which was notorious as the accompaniment of many excesses in the French Revolution. It first became popular in the south of France, where it was named after Carmagnole, in Piedmont, the home of many Savoyard boys who played the tune. The song began with :

Madame Véto avait promis,

and every verse ended with the refrain :

Dansons la Carmagnole—vive le son—du canon !

Fashion soon adopted the word, which was next applied to a sort of jacket, worn as a symbol of patriotism. Afterwards, it was applied to the bombastic and fanatical reports of the successes and glory of the French arms. With the Reign of Terror, the song and the jacket, associated with so many dismal recollections, together disappeared.

CARMEL is a mountain-ridge, 6 or 8 miles long, stretching nearly north and south from the plain of Esdraelon into the sea, the only great promontory on the low coast of Palestine. It is composed of a whitish stone, in which flints, sometimes curiously shaped, are imbedded. The height has been variously stated, but is probably about 1000 feet above the level of the plain. On the east is the river Kishon, and the Plain of Esdraelon; on the west, a small plain descending to the sea. Oaks, pines, olives, laurels, and other trees grow abundantly on the mountain; and various wild-fruits evince its ancient fertility and cultivation. The name C. means, *The garden of God*, or 'a very fruitful region.' Mount C. is renowned in Jewish history, and is often alluded to in the imagery of the prophets. On the summit of Mount C., there is a monastery called Elias, after the prophet Elijah, the monks of which take the name of 'Carmelites.' It is built on the supposed site of the grotto where Elijah lived, and the spot where he slew the priests of Baal. For an invalid in search of retirement, with every beauty that climate and natural scenery can offer, there can be no place superior to the convent on Carmel.

CARMEL, KNIGHTS OF THE ORDER OF OUR LADY OF MOUNT, were instituted by Henry IV. of France, and incorporated with the Order of the Knights of St Lazarus of Jerusalem. The Order of Mount C. consisted of 100 gentlemen, all French, who were to attend the king in his wars, and had considerable revenues assigned to them. The order was confirmed by bull by Pope Paul V. in 1607. The great master was created by the king putting about his neck a tawny ribbon, suspending a cross of gold, with the cloak of the order, and granting him power to raise 100 knights. None were admitted but those who had four descents of nobility both by father and mother.

622

CARMELITES, or ORDER OF OUR LADY OF MOUNT CARMEL, a monastic order probably founded as an association of hermits on Mount Carmel by Berthold, Count of Limoges, about 1156. A legend, however, ascribes the foundation of the order to the prophet Elijah; and another makes the Virgin Mary to have been a Carmelite nun. Driven out by the Saracens in the 13th c., the C. wandered over Europe; and Simon Stock, their general, changed them into a mendicant order in 1247. From that time, they shared in the usual vices of the mendicant orders. They subsequently divided into several branches, more or less rigid in their rules, one distinguished by walking barefooted. They exist at the present day in many Roman Catholic countries.—The order of *Carmelites*, or *Carmelite Nuns*, was instituted in 1452, and is very numerous in Italy.

CARMINATIVES (from Lat. *carmen*, a charm), medicines to relieve flatulence and pain in the bowels, such as cardamoms, peppermint, ginger, and other stimulating aromatics.

CARMINE, or CARMIN (Arabic, *kermes*), is a beautiful red pigment obtained from cochineal, and which is employed in the manufacture of the finer red inks, in the dyeing of silk, in colouring artificial flowers, and in miniature and water-colour painting. It was first prepared by a Franciscan monk at Pisa, who discovered it accidentally, while compounding some medicine containing cochineal; and in 1656, it began to be manufactured. It is the finest red colour known, and was more largely used formerly than now for imparting a healthy aspect to the cheek of beauty. One process for its preparation is to digest 1 lb. of cochineal in 3 gallons of water, for 15 minutes; then add 1 ounce of cream of tartar; heat gently for 10 minutes; add half an ounce of alum; boil for 2 or 3 minutes; and after allowing any impurities to settle, the clear liquid is placed in clean glass pans, when the C. is slowly deposited. After a time, the liquid is drained off, and the C. dried in the shade. In the preparation of C., much depends on a clear atmosphere and a bright sunny day, as the pretty colour of the C. is never nearly so good when it has been prepared in dull weather, and this accounts in great part for the superiority of French C. over that prepared in England. The great expense of pure C. has led to the fabrication and vending of substitutes. The *rouge* of the theatres is made from red sandal-wood, Brazil wood, benzoin, and alum, which are boiled in brandy or vinegar till a paint of an intense red colour remains. A more harmless material is obtained by evaporating the mixture till the liquid is driven off, and making up the red residue with balm of Mecca, spermaceti, or butter of cacao. The depth of the red tint may be lessened by the addition of chalk. The little colour-sanders called *rouge dishes*, obtained from Portugal, contain pure C.; but imitations are made in London, Spanish wool and Oriental wool, which are impregnated with red paint, intended for use on the cheek for improving the complexion, are seldom genuine.

CARMÖK, or KARMÖE, an island of Norway, at the entrance of the Bukke Fiord, in the North Sea, and 20 miles north-west of Stavanger, in lat. 59° 24' N., long. 5° 15' E. A strait 2 miles in width separates it from the mainland. With a length of 21 miles, and average breadth of 5, it has a population of 6400, who are principally engaged in the fisheries, and in cattle-rearing.

CARMONA, a town of Andalusia, Spain, 20 miles north-east of Seville. It is situated on an

## CARNAC—CARNELIAN.

elevated ridge, overlooking a rich and olive-clad plain, and its old massive Moorish walls and castle give it a very picturesque appearance. It has a fine old Gothic church, and the gate of Cordova is a most interesting piece of architecture. It has manufactures of woollen cloth, hats, leather; also flour and oil mills, and an important annual cattle-fair. Pop. 18,000.

CARNAC, a village in the department of Morbihan, France, 17 miles south-east of Lorient. It is remarkable on account of the great Celtic monument situated about three-quarters of a mile from the village, on a wide desolate plain near the sea-shore. The monument consists of 10,000—12,000 rude broken obelisks of granite, resting with their smaller ends in the ground, rising, many of them, to a height of 18 feet, though a large proportion does not exceed 3 feet, and arranged in 11 parallel rows, forming 10 avenues, extending from east to west, and having at one end a curved row of 18 stones, the extremities of which touch the outer horizontal rows. The origin and object of the monument remain a mystery. Similar but smaller structures are found to the west of C., at Erdeven and St Barbe. Pop. (1872) 603.

CARNAHUBA PALM, or CARANAIBA PALM (*Copernicia cerifera*), a very beautiful species of palm, which abounds in the northern parts of Brazil, in some places forming vast forests. It attains a height of only 20 to 40 feet; but its timber is valuable, is used in Brazil for a great variety of purposes, and is imported into Britain for veneering. The fruit is black, and about the size of an olive; it is sweet, and is eaten both raw and prepared in various ways. Scales of wax cover the under side of the leaves, and drop off when the fallen and withered leaves are shaken. Being collected in this way, the wax is melted into masses; and bees' wax is often adulterated with it. It has been imported into Britain, and used in the manufacture of candles, but no method has yet been devised to free it of its yellowish colour.

CARNA'RIA (Lat. *caro, carnis*, flesh), the Latinised form of the French *Carnassiers*, the name given by Cuvier to a great order of *Mammalia*, which, according to his system, includes all the non marsupial *Ferae* of Linnaeus, and along with them the bats, from the Linnaean order *Primates*. The C. have the toes terminated by claws; none of them have an opposable thumb on any of the extremities; they have incisors or cutting teeth, canine teeth or tusks, and molar teeth or grinders, but their dentition varies according to their kind of food, some preying on insects, others on the higher animals, whilst many of them are by no means exclusively addicted to animal food, but subsist in great part, and a few bats entirely, on vegetable substances. Cuvier at first included the marsupial quadrupeds in this order; but afterwards, recognising more fully the great importance of the characteristic from which they derive their name, constituted them into a distinct order, the remaining C. being divided into *Cetropiera* (Bats, q. v.), *Insectivora* (q. v.), and *Carnivora* (q. v.).

CARNATIC, a country of somewhat indefinite dimensions on the east or Coromandel coast of the peninsula of Hindustan. While some carry it as far inland as the Western Ghauts, others limit its breadth to about 75 miles. The length is generally taken from Cape Comorin to about 16° north. The C. is no longer a recognised division of the country, and exists only in history as the grand theatre of the struggle of last century between France and England for supremacy in India.

CARNATION (from Lat. *caro*, flesh). Flesh-tints

in painting are called carnations. The art of producing the true colour of flesh, from the rarity with which it is acquired by artists, would seem to be one of the most difficult branches of colouring. Whether from their painting less from the nude than the old masters, or from some other cause, it is certain that the moderns, and particularly the English, have been very unsuccessful in this respect. It is said that the pigments must be laid on thick and pasty. The ochres are preferable to vermilion for the local colours; and ultramarine ashes, or Veronese green, mixed with asphaltum, may be used for the shadows.

CARNATION, one of the finest of florists' flowers, a double-flowering variety of the Clove Pink (*Dianthus caryophyllus*, see PINK), and existing only in a state of cultivation. It has long been a universal favourite, both on account of its beauty and fragrance, although it does not appear to have been known to the ancients. The stem is about three feet high, and generally receives support. There are varieties, called *Tree Carnations*, with much taller stems, but they are not amongst the varieties esteemed by florists. The flowers are often three inches or more in diameter. Scarlet, purple, and pink are the prevailing colours; but whatever are the colours of a C., it is of no value, in the eyes of a florist, unless they are perfectly distinct. Fulness and perfect regularity are also deemed essential. The varieties are extremely numerous: those which have only two colours, disposed in large stripes through the petals, are called *Flake Carnations*; those which have three shades of colour, also in stripes, *Bizarre Carnations*; and those which have the flowers spotted with different colours, and the petals serrated or fringed, receive the name of *Picotees*. Great attention is at present paid in Britain to the cultivation of the C., and very fine specimens are often to be seen in the gardens of cottagers, especially about towns and villages. The soil for carnations must be rich, rather open, and the manure well rotted and intimately mixed. The finest kinds are generally grown in pots, and receive protection from cold winds and heavy rains, although free access of air is indispensable. Carnations are propagated in summer either by layers or by *pipage*, which are short cuttings of shoots that have not yet flowered, each having two joints. The young plants are transferred in spring to the bed in which they are to flower.

CARNE'ADES, a Greek philosopher, born at Cyrene, in Africa, about 213 B.C. He studied logic at Athens under Diogenes, but became a partisan of the Academy, and an enemy of the Stoics, whose stern and almost dogmatic ethics did not suit his sceptical predilections. Conspicuous for his eloquence and skill in 'tongue-fence,' he was destitute of any convictions moral or intellectual, and had even arrived at the conclusion that no criterion of truth existed in man. In 155 B.C., along with Diogenes and Critolaus, he was sent as ambassador to Rome, where he delivered two orations on justice, in the first of which he eulogised the virtue, and in the second proved that it did not exist. Honest Cato, who had no relish for intellectual jugglery, and thought it a knavish excellence at the best, moved the senate to send the philosopher home to his school, lest the Roman youth should be demoralised. C. died at Athens, 129 B.C. He was remarkable for his industry, negligent habits, and impatient temper.

CARNELIAN, or CORNELIAN, in Mineralogy, the name given to some of the finer varieties of Chalcedony (q. v.). The colour is blood red or flesh-colour, reddish brown, reddish white or yellow, more

rarely milk white. The fracture is in the common C. perfectly conchoidal, but there is a variety of a somewhat fibrous structure with a splintery fracture. C. is found in pieces of irregular form and in lamellar concretions. The finest specimens are brought from the East, but it is found in Scotland and in many parts of Europe and America. It is much used by the lapidary, and in the East it is prized beyond every other stone, the gems excepted. Bright red C. of unmixed colour is most highly valued, but a mass of considerable size is seldom found with the colour equal throughout.

CARNIO'LA (Ger. *Krain*), a crown-land of the Austrian empire, formerly part of the kingdom of Illyria, has an area of 3811 square miles, with a population (1869) of 466,334, being a decrease of nearly 40,000 as compared with the census return of 1854. A continuation of the Carinthian Alps passes through it in the north, and the Julian Alps in the south. The scenery of the country abounds in interesting and singular features, amongst which one of the most notable is the rock-bridge of Saint Kanzian, 130 feet high, and 160 feet broad, with a perfect arch 62 feet high, and 154 feet long. The Save is the principal river; the Kulpe is its chief tributary. The singular lake of Zirknitz (q. v.) is in Carniola. The climate of C. is in general mild, except in the high mountainous parts. The country does not produce corn or cattle enough to supply the wants of its inhabitants. Millet, pulse, and wild-fruits are principal articles of food with many of the lower classes. Maize is cultivated in some places, and some districts yield excellent wines and much fine fruit. Flax is largely cultivated; silk is produced in some places, and much honey and bees' wax. The principal products of the mineral kingdom are iron, quicksilver, and marble; the quicksilver mines of Idria are the most important in Europe. Linen-weaving, and the manufacture of a coarse lace, are common among the peasantry. Laybach is the capital.

C. received its present name after the settlement here of the Slavonic Wends. Charlemagne conquered it, and gave it to the dukes of Friuli. From 972 it had markgraves of its own, sometimes called Dukes, who possessed, however, only a part of the country. On the extinction of the male line of the markgraves, part of the territory passed to the Dukes of Austria, in the 13th c., and the remainder was acquired by them in the 14th, since which time it has remained in the possession of Austria.

CARNIVAL (from the Lat. *caro*, flesh, and *vale*, farewell—‘farewell to flesh!'), a festival in Italy, which originally began on the feast of the Epiphany, and continued to Ash-Wednesday, when the fast of Lent made an end of the preceding feasting, masquerading, and buffoonery. In later times, the C. was limited to the time of from three to eight days before Ash-Wednesday. Without doubt, the forms and customs still preserved in the celebration of the C. originated in the heathen festivals of spring-time; and they still remind us, partly of the Lupercalia and Bacchanalia of Southern Europe, and partly of the Yule-feast among northern peoples. Banquets of rich meats and drinking-bouts were the chief attractions of the C. during the middle ages. Shrove-tide (q. v.), or Shrove-Tuesday, called also Fasten-Even or Pancake-Tuesday, was a relic of the English C., and formerly a season of extraordinary sport and feasting. The rich commenced the festive time at the feast of Epiphany, or on ‘Three Kings’ Day; but the middle classes restricted their days of revelry to the week immediately preceding Lent; while the poor indulged in only a few days of mad mirth. According to a papal order, the clergy

were allowed to commence their bacchanalia two days before the laity. The several chief days of C. had distinct names, such as ‘fat’ or ‘greasy Sunday,’ ‘blue Monday’ (or ‘fool’s consecration’), &c. The Tuesday before the beginning of Lent was especially styled C.—the *Fasnacht* of the German people. The customs of making presents of green nosegay or garlands, and planting fir-trees before houses during C., remind us of the *thyrus* of the ancient Bacchanals, and equally of the decorations of the Yule-tide or Christmas season among northern people. The ancient custom, also, of scourging women accidentally met with during the Lupercalia (q. v.), was preserved in the mediæval observance of the carnival. In most countries, especially where Protestantism prevails, the observance of the C. is now limited to dancing and masked balls on certain days; but in Italy, as Goethe says in his charming sketch of the Roman C., it is still a general popular festive time. In former times, Venice was distinguished by the pomp and splendour of its C.; but afterwards, Rome became most prominent. The years of angry politics, 1848 and 1849, had a discouraging effect on the attempts which had been made to restore the gaiety of C. in the Roman Catholic towns of Germany.

CARNIVORA (Lat. *flesh-devouring*), in Cuvier's system of zoology, a principal division of the order of *Mammalia* called *Carnassiers* or *Carnaria* (q. v.), and including the most *carnivorous* or sanguinary of that order—the quadrupeds which chiefly prey on other vertebrate and warm-blooded animals. The C. have six incisors or cutting teeth in each jaw; their tusks or canine teeth are very strong, and even their molar teeth or grinders are usually furnished with cutting edges. But even the C. are carnivorous in very different degrees, and some of them have teeth and other organs adapted to a partial use of vegetable food. Cuvier

subdivided the C. into three tribes—*Plantigrada* (q. v.), *Digitigrada* (q. v.), and *Amphibia* (Seals, q. v., &c.). The digestive apparatus of carnivorous animals is more simple than that of the herbivorous; the stomach is single, and in general of comparatively small size, and the intestines are comparatively short and unvoluminous. Their muscular energy is very great, their respiration and circulation very active, and their demand for food very constant. Some of them are adapted for seizing their prey by leaping, others by running, a few by swimming and diving. Most of them can only seize it with their mouths; but some have also, for this purpose, sharp retractile claws.

CARNOT, LAZARE NICOLAS MARGUERITE, born May 13, 1753, at Nolay, in the department of *Côte d'Or*, Burgundy, gained distinction at an early period by his talents in mathematical science and military engineering. In 1791, he became a member of the Legislative Assembly, and, in the Convention, voted for the death of Louis XVI. After taking the command of the army of the north, and gaining the victory of Wattignies, he was elected into the Committee of Public Safety, in which he was intrusted with the chief direction of military affairs, and greatly contributed to the successes of the French army. Though he endeavoured to restrict the power of Robespierre, he was accused,

Carnivora:  
Jaws and Teeth of Lion.

with others, after the Reign of Terror; but the charge was dismissed. In 1797, having opposed the extreme measures of Barra, his colleague in the Directory, C., as a suspected royalist, was sentenced to deportation. He escaped into Germany, where he wrote his defence, which conducted to the overthrow of his colleagues in 1799. The 18th Brumaire brought him back to Paris, where he was made Minister of War, 1800; and by his energy, skill, and fertility of administrative resource, helped to achieve the brilliant results of the Italian and Rhenish campaigns. He retired, however, from his office when he understood the ambitious plans of the emperor, but hastened, when he witnessed the reverses of the empire, to offer his services to Napoleon, who gave him the command of Antwerp in 1814, which he heroically defended. During the Hundred Days, he held office as Minister of the Interior; and after the second restoration, retired first to Warsaw, and next to Magdeburg, where he died, August 2, 1823. Among C.'s numerous writings on mathematics and military tactics, &c., we may notice his *Essai sur les Machines en Général* (1786), *Réflexions sur la Métaphysique du Calcul Infinitésimal* (1797), and the *Géométrie de Position* (1813).—His son, **LAZARE HIPPOLYTE CARNOT**, born at St Omer, April 6, 1801, one of the leaders of the French democracy, was in early life a disciple of St Simon, but, like others, left that school on account of the lax morals advocated by Enfantin—protesting against 'the organisation of adultery'—and devoted himself to the inculcation of a more orthodox and virtuous socialism in various periodicals. In 1847, he declared himself a republican in his brochure, *Les Radicaux et la Charte*; and, after the February Revolution, was appointed Minister of Public Instruction, but not finding himself in sufficient rapport with his colleagues, he resigned. In 1863, however, he entered the Corps Législatif, but, at the election of 1869, was defeated by Gambetta. He was returned to the National Assembly for Seine-et-Oise in 1871.

**CAROB, ALGARROBA, or LOCUST-TREE** (*Ceratonia siliqua*), a tree of the natural order Leguminosæ, sub-order *Oealpinicæ*, a native of the countries around the Mediterranean Sea, in size and manner of growth much resembling the apple-tree, but with abruptly pinnate dark evergreen leaves, which have about two or three pair of large oval leaflets. The flowers are destitute of corolla; the fruit is a brown leathery pod, 4—8 inches long, a little curved, and containing a fleshy and at last spongy and mealy pulp, of an agreeable sweet taste, in which lie a number of shining brown seeds, somewhat resembling small flattened beans. The seeds are bitter and of no use, but the sweet pulp renders the pods an important article of food to the poorer classes of the countries in which the tree grows. They are very much used by the Moors and Arabs. They are also valuable as food for horses, for which they are much employed in the south of Europe, and have of late years begun to be extensively imported into Britain, under the name of *Locust Beans*, which name and that of *St John's Bread* they have received in consequence of an ancient opinion or tradition, that they are the 'locusts' which formed the food of John the Baptist in the wilderness. It seems probable that they are the 'husks' (*keration*) of the parable of the Prodigal Son.—The Arabs make of the pulp of the C. a preserve like tamarinds, which is gently aperient.—The C. tree is too tender for the climate of Britain. Dr Royle thinks its introduction into the north of India would be an important addition to the resources of that country, and a valuable safeguard against famine. The produce is extremely abundant,

some trees yielding as much as 800 or 900 lbs. of pods. The wood is hard, and much valued, and the bark and leaves are used for tanning.—The LOCUST-TREE (q. v.) of America is quite distinct from this.

**CAROLINA, NORTH**, an Atlantic state of the American Union, having South Carolina and Georgia on the S., Tennessee on the W., and Virginia on the N.; in lat.  $33^{\circ} 53'$ — $36^{\circ} 53'$  N., and long.  $75^{\circ} 25'$ — $84^{\circ} 30'$  W., being about 450 miles long, and about 180 broad, with an area of about 50,704 square miles. The census of 1870 gave 678,470 whites, 391,650 negroes, and 1,241 civilised Indians—1,071,361 in all. North Carolina was restored to a place in the Union in 1868, after a new constitution had been adopted by the state government, and approved by Congress. It sends 8 members to the Lower House of Congress, returning also, in common with every other state, 2 senators to the Upper. The public indebtedness of North C. amounts to 32,474,036 dollars, and its valuation of property for 1870 is 1,167,731,697 dollars. Annual expenses of government, 1,400,000 dollars. Of railways, there were, in the year 1872, in actual operation, 1,193 miles. The principal rivers are the Chowan, Roanoke, Tar, Neuse, and Cape Fear. Of these, the first four divide themselves equally between Albemarle and Pamlico Sounds—inlets which, besides being shallow and difficult in themselves, are almost entirely cut off from the sea by a nearly continuous series of low islands; and the last of the five, though it does fall into the open ocean, is yet not materially superior to the others, never shewing more than 14 feet of water on the bar. With this insular breast-work the mainland is geologically connected to a depth of about 60 miles, being everywhere alluvial, and in many places swampy. To the west of this belt, the country, after undulating into hills, is traversed by the ridges of the Alleghanies, which, culminating in Mount Mitchell to an elevation of 6,470 feet, bear aloft between them a table-land of fully one-third of that altitude. Through the maritime tract, and even beyond it, the rivers are generally practicable for steam-boats. Among the productions, the most characteristic is the pitch-pine of the lower levels; so that, in the matter of naval stores, this state surpasses all the rest of the Union taken together. In mineral resources, also, North C. takes a lead, more especially in gold, copper, iron, and coal. The value of the materials used for manufacturing in North C. in 1870 was 12,824,693 dollars; that of the manufactured products was 19,021,327 dollars. The chief towns are Raleigh, the capital, near the Neuse; and Wilmington and Fayetteville on the Cape Fear, the former within reach of tide-water, and the latter at the head of the navigation. North C. was first permanently colonised from Virginia in 1653. Down to 1693, it continued to form one province along with South Carolina, the two being frequently, even at the present day, classed as the Carolinas. In a local declaration of independence of May 1775, 14 months before the 4th of July 1776, North C. first demanded a separation from Great Britain.

**CAROLINA, SOUTH**, an Atlantic state of the American Union, of a triangular form, with North Carolina and Georgia on its inland sides. It extends between  $32^{\circ}$  and  $35^{\circ} 10'$  N. lat., and  $78^{\circ} 35'$  and  $83^{\circ} 30'$  W. long., having an area of 34,000 square miles. According to the census taken in 1870, the total population of South C. was 705,606; of whom 289,667 were whites, 415,814 negroes, and 124 civilised Indians. The total population in 1870 was 345,591. South C. formerly differed from all the other states in appointing its presidential

## CAROLINA PINK—CARP.

electors, and its executive, not by the popular suffrage, but by the joint vote of the two branches of the local legislature, being thus pre-eminent in the aristocracy of its constitution. In 1868, however, in the reconstruction of the Southern States, South C. was restored to a place in the Union, with a new constitution adopted by a majority of voters, and approved by Congress. It is represented in Congress by 5 members in the Lower House, besides the 2 senators which each state possesses alike. Physically a continuation of its northern neighbour, South C., behind a breast-work of islets, presents a low belt, generally swampy, of about 100 miles in depth, rising backward through an undulating region to a height of 4000 feet in the Alleghanies. With such a range of soil and climate, the productions are very various—cotton, rice, tobacco, indigo, sugar, silk, maize, and wheat. In the first two articles, South C. stands pre-eminent, exporting more rice than all the other states together, and yielding more cotton, in proportion to area, than any other state. Its mineral treasures are chiefly granite, sienite, marble, and gneiss, from the primitive formations of the state, for building; along with gold, lead, and iron: it is probable that no coal will be found. The public indebtedness of South C. in 1870 was 13,075,229 dollars, and the assessed value of property 183,913,337 dollars. Since the reconstruction of the state, public institutions have made great progress. With not much more than 20 miles of canal, South C. has 1219 of railway. The chief rivers, each the receptacle of considerable affluents, are the Great Pee Dee, Santee, and Edisto, and also the Savannah, as common to Georgia and South C., the whole being said to furnish an inland navigation of 2400 miles. The maritime communications, too, are decidedly preferable to those of North Carolina. The cotton product of South C. in 1866 amounted to 112,273 bales; in 1868 to 240,223; and in 1870 to 224,500 bales. The chief towns are Charleston, Columbia (the capital), and Georgetown.

CAROLINA PINK. See SPIGELIA.

CAROLINE, AMELIA ELIZABETH, wife of George IV. of Great Britain, was the second daughter of Charles William Ferdinand, Duke of Brunswick Wolfenbüttel, and of the Princess Augusta of Britain. She was born on 17th May 1768, and spent her youth under great restraint at her father's court. In 1795, she was married to the Prince of Wales. The marriage was disagreeable to him, and although she bore him a daughter, the Princess Charlotte, he separated from her immediately on her recovery from childbed; and she lived by herself in a country residence at Blackheath, the object of much sympathy, the people regarding her as the victim of her husband's love of vice. Reports to her discredit led the king, in 1808, to cause investigation to be made into her conduct, which was found to be imprudent but not criminal. In 1814, she obtained leave to visit Brunswick, and afterwards to make a further tour. She visited the coasts of the Mediterranean, and lived for some time on the Lake of Como, an Italian, by name Bergami, being all the while in her company. When her husband ascended the throne in 1820, she was offered an annuity of £50,000 sterling to renounce the title of queen, and live abroad; but she refused, and made a triumphal entry into London, wheresupon the government instituted proceedings against her for adultery. Much that was very offensive was proved as to her conduct; but the manner in which she had been used by her husband, and the splendid defence of Brougham, caused such a general feeling in her favour, that

626

the ministry were obliged to give up the Divorce Bill, after it had passed the House of Lords. She now fully assumed the rank of royalty, but was refused coronation, and turned away from the door of Westminster Abbey on the day of the coronation of her husband. She died on 7th August 1821.

CAROTID ARTERY. The great artery which on each side distributes blood to the different parts of the head, appears to have derived its name either from Gr. *καρόν*, the head, or, more probably, from Gr. *καῦσις*, sleep, there being an old idea, which the researches of Dr Alexander Fleming have shewn to be correct, that there was some connection between deep sleep and compression of these vessels.

Each C. A. consists of the primitive or common carotid, which, at the upper margin of the larynx or organ of voice, separates into two great divisions, of nearly equal size—the external and the internal carotid. The external carotid supplies the larynx, tongue, face, and scalp with blood; its principal branches being the superior thyroid, the lingual, the facial, the occipital, the posterior sural, the internal maxillary, and the temporal. The last-named artery is occasionally opened by the surgeon in preference to a vein, as, for example, in certain cases of cerebral suppuration. The internal carotid enters the cavity of the cranium through a somewhat tortuous canal in the temporal bone, and after perforating the dura mater, or fibrous membrane of the brain, separates into the anterior and middle cerebral arteries, which are the principal arteries of the brain; while in its course through the dura mater, it gives off the ophthalmic artery, which subdivides into several small branches that supply the eye and surrounding parts. See CIRCULATION.

Surgery.—Wounds of the carotid trunks are generally from stab. Suicides have a vague desire to cut them, but rarely cut sufficiently deep by the side of the windpipe. Of course, should either vessel be wounded, death results almost immediately. Punctured wounds, however, may not be immediately fatal; they may heal, or a false aneurism (q. v.) may result. Such an occurrence happened about four years ago in Scotland. A young man was stabbed close to the root of the neck; a pulsating tumour formed, which rapidly increased, and would undoubtedly have burst before long, had not Professor Syme of Edinburgh cut into it, and, by an operation requiring extraordinary courage and dexterity, tied the common C. A. above and below the part stabbed; thereby saving not only the life of the patient, but that of the man who had inflicted the wound, and who was then in prison awaiting his trial.

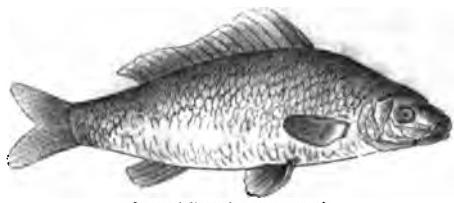

Sir Astley Cooper was the first to tie the common carotid for spontaneous aneurism, in November 1805; and since then, the operation has been successfully performed in a number of cases. Owing to the numerous interchange of branches between vessels of both sides of the head, cutting off the supply of blood through one carotid is seldom followed by affections of the brain. Such have, however, occurred in a few instances; but Dr Mussey of America tied both carotids within twelve days of each other without any such result.

The common carotid in the horse is the termination of the right arteria innominata. It is a large vessel, about an inch long, which emerges from the chest below the windpipe, and divides into the right and left carotids. These bend upward, having the windpipe between them, gradually inclining inwards at the upper part, where each divides into external and internal carotid, and a large anastomosing branch arising from between these two.

CARP (*Osteobrama carpio*), a fish of the family

## CARP—CARPATHIAN MOUNTAINS.

*Cyprinidae* (q. v.), of which, indeed, it may be regarded as the type, a native of the central countries of Europe, and corresponding latitudes in Asia, but on account of its value as an article of food, long naturalised in many countries in which it is not indigenous. No fish, indeed, except its congener the goldfish, has been so much transported by man from one place to another; and this has been the more easily and successfully accomplished, that the C. can subsist longer than most fishes out of the water, if only kept

Carp (*Cyprinus carpio*).

moist. The C. is said not to be originally a native of England, but the statements sometimes made as to the time of its introduction are untrustworthy; it certainly existed in England before the 16th century. It is mentioned in the famous Boke of St Albans, in 1496, by Dame Juliana Barnes, as a 'dayntous fyshe, but scarce.' The C. spawns in May, and is out of condition until July. It does not succeed so well in Scotland, of which country it is certainly not a native, as in the south of England; and in northern countries generally, it neither increases so rapidly in size, nor exhibits so great fecundity, as in more congenial climates. Its fecundity, in favourable circumstances, is prodigious; more than 700,000 eggs have been found in the ovaries of a single C. of moderate size. The C. is rather an inhabitant of lakes and ponds than of rivers, in which, if it is found, it shews a preference for the stillest parts. It feeds chiefly on aquatic plants, and may be fattened on lettuces and similar soft vegetables, for which its teeth are remarkably adapted, being few, mostly large, flat, and situated on the pharynx very far back in the mouth; worms, mollusks, and insects, however, form part of its food. It deposits its spawn on weeds. It is said to live to a great age, even 150 or 200 years; its scales, 'like the productions of the cuticle in some other animals, becoming gray and white with age.' It is known to attain the weight of 3 lbs. when six years old. A C. of 18 or 19 lbs. weight is deemed of extraordinary size in England, but one of 70 lbs. weight, and nearly 9 feet long, was taken near Frankfort-on-the-Oder, and 30 or 40 lbs. is not an unusual size in some of the German lakes. In Austria and Prussia, many lakes and ponds are let at a high rent for the C. which they contain.—Of the other species of the genus *Cyprinus*, as now restricted, which are found in Britain, none belong to the section having barbules at the angles of the mouth. See CRUCIAN, GIREL, and GOLDFISH.

To the angler, the C. is not a very valuable fish, as he is by no means a free biter. When hooked, however, he runs strongly, and fights with considerable determination and cunning. In still water, the best means of fishing for C. is with a very light quill-float. A small piece of dead rush will answer the purpose equally well, or better. The float should be fixed on the line so that the bait may be upon the bottom, and if that be clear of weeds (the angler must take care that it is so), the C. will easily see and pick up the bait. It is advisable, however, in fishing for C., to use two rods, and the

float to one of these should be so placed that the bait may be just off the bottom. The former tackle should be baited with well-scoured red worms, gentles, or grubs of some sort; the latter with a green pea, boiled wheat, or pasta. The hooks should be of No. 8 size, and tolerably stout in the wire, and the gut perfectly round and good, and as fine as is consistent with the size of the fish angled for. In using green peas or wheat, boil until the skin cracks. Very small potatoes of the size of a bean have been known to attract good carp. The best paste is bread worked up with a little brandy or gin. Gentles, wasp grubs, flies, and other insects, worms, or caterpillars, may all, at times, take carp. When a C. bites, he nibbles at the bait for some seconds before he takes it, and often takes off the tail of the worm, or strips the hook completely. But it is quite useless to strike until the float disappears entirely.

The place designed to be fished should be baited previously some two or three evenings in succession, and the depth of the water should be taken the night before; but with all these precautions, when the angler goes out for large C., he will have, as Walton says, to practise a large measure of patience.

**CARPATHIAN MOUNTAINS**, the mountains which enclose Hungary and Transylvania on the north, east, and south in a great semicircle (whose concavity is towards the south-west), extending over a space of 800 miles from Presburg on the Danube to Orsova on the same river, between lat. 44° 30'—49° 40' N., long. 17°—26° E. The C. M. form part of the great mountain system of Central Europe, separated from the mountains of Silesia and Moravia by the Valley of the March, and from the Alps and Mount Hæmus by the Valley of the Danube. Almost the whole of the C. M. lie within the Austrian dominions. They form two great masses, one in Hungary to the north-west, and one in Transylvania to the south-east, with ranges of lower and wooded mountains between. The highest group of the Hungarian Carpathians is that of *Tatra* or the *Carpas*, in the very north of Hungary, a majestic mass of granite mountains, exhibiting much grandeur in its naked precipices, and in some of its peaks rising to the height of more than 8000 feet, the Lomnitz peak being 8133 feet high. On the northern declivity of the Eisthal peak exists the only glacier in the Carpathians. The Tatra group is penetrated by no valleys, but only by wild ravines, and is separated from the rest of the range by deep depressions. There is a great difference of climate between its southern and northern sides. These higher mountains yield few minerals, but the lower Carpathians of Hungary, which stretch around them in groups and ranges, abound in minerals of various kinds. The mines of Schemmits (q. v.) are of great celebrity. Many of the Hungarian mountains are of limestone. The mountains of Transylvania are mostly of primitive rocks. On the eastern and southern borders, they reach the height of 9000 feet and upwards. Mount Butschetje, the culminating peak, has an elevation of 9528 feet above the sea. The C. M. are generally clothed with wood to a height of more than 4000 feet—in some parts, forests are found at 5500 feet—and with steep precipices, narrow ravines, extinct craters, and cones of volcanic origin, they exhibit scenes of grandeur rarely exceeded. The lower parts of the mountains are beautifully clothed with vineyards, walnut groves, &c., above which ascend forests of cherry, beech, and pine. The ranges which connect the high mountains of Hungary with those of Transylvania are in great part composed of sandstone, have an unfruitful soil, and comparatively little population or cultivation.

## CARPEL—CARPENTRY.

**CARPEL** (Gr. *karpos*, fruit), in Botany, a modified leaf forming the whole or part of the pistil of a flower. The number of ovaries and stigmas in the pistil depends on the number of carpels of which it is composed, but sometimes several are so intimately united that they appear as one. It is the upper surface of the leaf which forms the inner surface of the carpel. At its margins, the ovules are developed, like the buds formed on true leaves of some kinds of plants. The fruit, as well as the pistil, may therefore be said to be composed of one or more carpels.

**CARPENTERIA**, GULF OF, a broad and deep indentation of the north coast of Australia, stretching from  $11^{\circ}$  to  $17^{\circ} 30' S.$  lat., and from  $136^{\circ}$  to  $142^{\circ} E.$  long. It is said to have been named from Carpenter, a Dutchman, who discovered, and partly explored it in 1627. The Gulf of C.—resembling, in this respect, Torres Strait, of which it is, in fact, an arm—contains many islands, particularly the Groote cluster, near the west extremity, and the Welleley group towards the south-east. The shores of the mainland are generally low; and, in the rainy season, the floods are such as materially to freshen the sea.

**CARPENTER**, WILLIAM BENJAMIN, M.D., F.R.S., one of the most distinguished physiologists and writers on physiology of the present day. Very shortly after his graduation, in Edinburgh in 1839, he published his *Principles of General and Comparative Physiology*, which was one of the earliest works giving a general view of the science of life. This work, under its original title, passed through three editions, when it was thought desirable, from its greatly increased size, to separate the two subjects of which it treats; and in 1854 a volume, entitled *The Principles of Comparative Physiology*, was published, which was followed by a companion volume on *The Principles of General Physiology*. These works, together with *The Principles of Human Physiology*, which originally appeared in 1846, and reached a fourth edition in 1853, and *The Principles of Mental Physiology* (Lond. 1874), form a perfect cyclopaedia of biological science. C. has likewise published *A Manual of Physiology*; *The Microscope, its Revelations and its Uses*; a prize essay upon *The Use and Abuse of Alcoholic Liquors*; and numerous memoirs on various departments of Physiology, Microscopical Anatomy, and Natural History, in the *Philosophical Transactions*, &c. His most important original researches are *On the Structure of Shells*; *On the Development of Purpura Lapillus*; and *On the Structure, Functions, and General History of the Foraminifera*. For several years he edited *The British and Foreign Medico-Chirurgical Review*, and he was one of the editors of *The Natural History Review*. In 1848, he was appointed Professor of Medical Jurisprudence at University College, and soon afterwards was elected an Examiner in Physiology and Comparative Anatomy in the university of London; but he resigned these offices on his appointment, in 1856, as Registrar to that university. In 1861, the Royal Medal was awarded to him by the Royal Society, for his contributions to physiological science. In 1868—1870, he took a principal part in the government expedition for exploring the deep sea.

**CARPENTER**, SHIP'S, is a warrant-officer, midway in rank between the commissioned and the petty officers, whose duty it is to see after necessary repairs of hull, masts, and spars. During battle, he watches for shot-holes, and is prepared with plugs to stop them up. He attends constantly to the state of the pumps. He makes a daily return to the senior lieutenant of each day's work, and is

expected to be always able to make a report as to the ship's qualities. He is assisted by a *C.'s mate* and a *C.'s crew*. His pay varies from £60 to £120 per annum, plus 3d. per day for 'tool-money.'

**CARPENTER BEE**, a name given to those bees that excavate their nests in wood. One of these,

Carpenter Bee (*Xylocopa*):  
Shewing the Cells for Eggs and Larva, excavated in dead-wood.

*Xylocopa violacea*, has been already noticed, and its nest briefly described, in the article **BEE** (q. v.).

**CARPENTRAS**, a town of France, in the department of Vaucluse, is situated on the left bank of the Auzon, about 15 miles north-east of Avignon. It is surrounded by old walls, flanked with towers and pierced by four gates, one of which, the Porte d'Orange, is a fine structure. The principal buildings are the cathedral, with a tower dating from the 10th c., a massive aqueduct of 48 arches, the palace of justice, and the theatre. This town was known to the Romans as *Carpentras*, and among other remains, a triumphal arch attests their former presence here. C. has manufactures of cottons, woollens, and leather; brandy distilleries, dye-works, &c. It is the entrepot for the products of the district. Pop. (1872) 7857.

**CARPENTRY** is the art of framing timber for architectural and other purposes. Technically, the term is restricted to the framing of heavy work, such as the roofs, floorings, partitions, and all the wood-work concerned in maintaining the stability of an edifice, while the minor and ornamental fittings are called *Joinery*; but popularly the workman who does either kind of work is called a carpenter, and as the operations of both are so nearly identical, we shall treat the subject according to this sense.

The carpenter who has any pride or ambition in his work requires a sound knowledge of mechanical science, especially of all that relates to the Communication of Pressure, the Composition and Resolution of Forces, and the Strength of Materials, in order that he may adapt his work to the strain it will be required to resist. These subjects will be treated under their respective heads, and the present article confined to a popular description of the most useful methods of framing timber and smaller wood-work.

The preliminary preparation of timber is the work of the sawyer, who, by the saw-mill or pit-saw, divides the trunks of trees into planks, &c.; these are further divided by the carpenter, who uses hand-saws of various kinds, according to the work. For dividing wood into separate pieces in the direction of the fibre, the *ripping-saw* is used; for cross cutting, or sawing thin pieces in the direction of their length, the common *hand-saw* or the finer

## CARPENTRY.

toothed *panel-saw*; for making an incision of a given depth, and for cutting small pieces across the fibre, the *tenon-saw*, the *sash-saw*, or *dovetail-saw* is used. These are thin saws, stiffened by a strong piece of metal at the back to prevent crippling. When a curved cut is to be made, a very narrow saw without a back, called a *compass-saw* or a *keyhole-saw*, is used. The general name for these is *turning-saw*; they have their plates thin and narrow towards the bottom, and each succeeding tooth finer, and the teeth are not bent on contrary sides of the plate for clearing, as in broad saws.

The surface of wood is smoothed by planing. According to the work, different kinds of planes are used: the *jack-plane*, which is large and rough, for taking away the rough of the saw; the *try-plane*, for bringing the surface perfectly level and true, or the *long-plane* for the same purpose, where the work is of great length, as for the joining edges of long boards to be glued together. The *smoothing-plane*, which is much smaller than these, gives the smooth finished surface. The *spoke-shave*, a sort of plane with a double handle, is used for paring and smoothing rounded work.

Ornamental mouldings are cut by means of moulding-planes, which have their cutting edges curved to the required pattern. A good stock of these is one of the most expensive items of the tool-chest.

The paring of wood, and the cutting of rectangular or prismatic cavities, notches, &c., are done by means of *chisels*. Those for cutting across the fibre are called *formers* or *paring-chisels*; those for cutting deep and narrow cavities, *mortise-chisels*, which are made very thick and narrow, and fitted in the handles with a strong flange, to bear heavy blows with the mallet. Chisels for paring concave surfaces are called *gouges*. For boring holes, *broad-axes*, *gimlets*, *centrals*, and *gouges* are used—the two latter are fixed in a *stock* or revolving handle, and are used for large holes. When it is required to ascertain if an angle be square, or of any given inclination, the *square*, or the *bevel* set to the required angle, is applied to test the work as it proceeds. When parallel edges are required, the *marking gauge* is used to draw the line to be worked to. When a simple straight line is required for working to, a piece of string is chalked, then stretched tightly over the wood and lifted in the middle, when, by its recoil, it strikes the wood and leaves a straight chalked line. The *straight-edge*, a strip of wood with one of its edges perfectly straight, is applied to detect superficial irregularities. The operation of planing the edge of a board straight is called *shooting*, and such edges are said to be *shot*. When the joiner requires to ascertain whether the surface of a piece of wood is all in one plane, he takes two slips of wood with edges perfectly straight and parallel, and of equal width; these slips, called *winding-sticks*, are placed edge upwards, one at each end, across the board, and the workman looks in the longitudinal direction of the board over the upper edges, and if the two edges be not in the same plane, the board is planed down at the elevated part until it is *out of wind*. For setting work level, a *spirit-level*, set in a wooden frame, or a *plumb-level* is used. For further description of the tools alluded to above, and in the rest of this article, see the special articles.

When two pieces of timber have to be united at their ends, as in lengthening the beams for roofing, partitions, the masts and keels of ships, &c., the operation is called *scarfing*, and the joint a *scarf*. The methods of scarfing are very numerous; those figured below will serve to illustrate the principal.

Fig. 1 is a section shewing the common or single step scarf, with plates, and the bolts passing through.

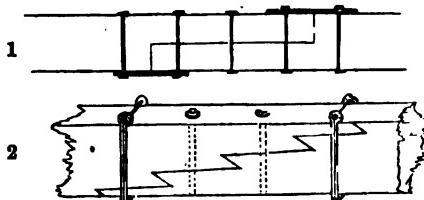

Fig. 2 is the French scarf, called *traits de Jupiter*, or *Jupiter's lightnings*, with the straps and bolts shewn. In these the scarf itself gives no resistance to the longitudinal strain. Fig. 3 shews a scarf in which the resistance of the wood to splitting is made available.

The following are the principal rules for scarfing as stated by Tredgold.

The length of the scarf should be, if bolts are not used—in oak, ash, or elm, six times the depth of the beam; in fir, twelve times the depth of the beam. If bolts and indents are combined, the length of the scarf should be—in oak, ash, or elm, twice the depth of the beam; in fir, four times the depth. In scarfing beams to resist transverse strains, straps driven on tight are better than bolts. The sum of the areas of the bolts should not be less than one-fifth the area of the beam, when a longitudinal strain is to be borne. No joint should be used in which shrinking or expansion can tend to tear the timbers. No joint can be made so strong as the timber itself. When two pieces of timber are connected so that the joint runs parallel with the fibres of both, it is called a *longitudinal joint*; but when the place of the joint is at right angles to the fibres of both, an *abutting joint*.

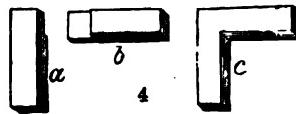

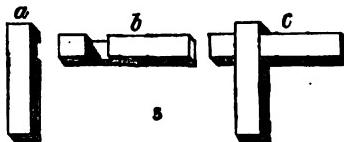

Fig. 4 is an example of common and simple joint, for connecting timbers at right or other angles. It

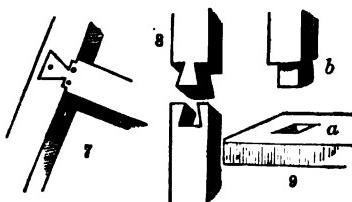

is called a *notched joint*, and requires bolting. Fig. 5 is a notched joint for crossing timbers. In both figures, 'a' and 'b' represent the pieces before joining, and 'c' when united. Timbers may be joined end to end by a simple notching, or by dovetailed notching, as fig. 6. Other applications of dovetailing timbers are shewn in figs. 7 and 8. Tie-beams, connected to wall-plates, as in fig. 7, are said to be cogged or cocked, whether dove-tailed or simply notched.

The mortise and tenon joint is shewn in fig. 9; the cavity in 'a' is the mortise, the projection on 'b' the tenon. A very short tenon is called a *stub*.

## CARPENTRY—CARPETS.

*tenon.* When a second minor tenon is made projecting from the principal tenon, it is called a *tusk tenon*.

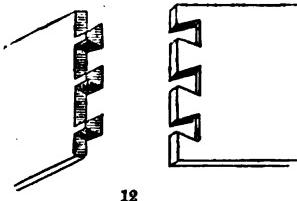

Figs. 10 and 11 shew methods of framing a rafter foot into a girder.

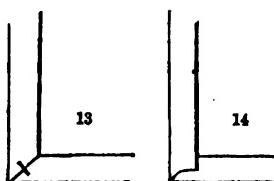

The above joints are some of those used in heavy work, or carpentry proper. For lighter joiner's work, similar methods of framing are used, only adapted to the work—to boards generally instead of beams; thus, for example, the mortise and tenon joint, made oblong instead of square, is used in framing doors, shutters, drawing-boards, or any other kind of extended superficial work liable to warping. An outside frame or skeleton is made with a panel or panels in the middle, and each piece of the frame has the grain at right angles to the piece into which it is mortised, in order that they shall eventually correct the warping.

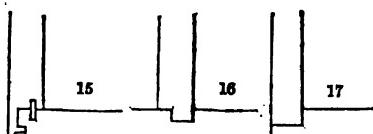

Dove-tailing is extensively used for connecting

boards at right or other angles, as in making boxes, drawers, &c. The common dove-tail is shewn in fig. 12;

the common mitre, fig. 13; the lapped mitre, fig. 14;

Modes of notching for boards are shewn in figs. 16, 17, and 18. Fig. 16 is called a *nosing*, also shewn at fig. 21, in its common application for fixing the *risers* to the *treads* of staircases. Common

dove-tailing is usually glued. Nails or pins and glue are used with the mitre and other notched joints.

Boards may be united at their edges to form an extended surface, as a flat plank partition, &c., either by simple gluing of the shot edges, by a *rebate* (fig. 19), or by a ploughed groove and a corresponding projection. The rebate is cut by means of a rebating plane; that in the figure is combined with a bead, the usual joint for wooden partitions. The groove, fig. 20, a sort of extended mortise, is cut by a plane with a projecting iron called the *plough*.

In all cases where glue is used in joints, it should be applied to both surfaces, which should be rubbed and pressed together until nearly all the glue is forced out, then kept pressed by a cramp or weights. White lead is used for outside joints.

Special departments of this subject, such as Roof, Staircases, &c., will be treated under their respective heads.

**CARPETS.** Woven C., such as are now so common in this country, were first used in the east, where the custom of sitting cross-legged on the floor still renders them especially useful. Our rude forefathers covered the floors of their houses with rushes, hair, or straw; and in Norwegian farm-houses, where so many of our ancient customs still exist, the floor of the best room is commonly strewed with juniper-twigs. The first step towards a woven carpet was made by plaiting rushes to form a matting.

The principal varieties of C. now in use are the Turkey, the Axminster, the Brussels, the Wilton, the Venetian, the Dutch, the Kidderminster or Sooth, Whytock's Tapestry and Velvet Pile, and the Printed Felt Carpet.

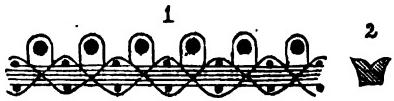

The real Turkey carpet is made in one piece; those manufactured for the orientals are usually too small for use in this country. The patterns consist merely of curved and angular strips, of variegated but dark and unobtrusive colours. The warp is of strong linen or cotton, to which bunches or tufts of coloured worsted are tied according to the pattern, a drawing of which is placed before the weaver to copy. The surface is afterwards worn level. Rugs are made in a similar manner; the coloured worsteds are tied very rapidly by young girls.

The Axminster Carpet is merely the English-made Turkey carpet, formerly manufactured as above at Axminster, in Devonshire. They are usually made to order, and of the size required for the room; from the tedious nature of the process of manufacture, they are very expensive.

Templion's Patent Axminster Carpet is a very beautiful fabric, very much resembling that from which it derives its name, but it is wrought on the chenille principle.

The Brussels Carpet is a mixture of linen and worsted, but, like the Turkey carpet, the worsted only is shewn on the upper surface. The basis or cloth is a coarse linen fabric, and between the upper and under threads of the weft, several (usually five) worsted threads of different colours are firmly bound in. The pattern is produced by drawing to the

surface, between each reticulation of the cloth basis, a portion of the worsted thread of the colour required at that spot to produce the pattern; these updrawn portions are formed into loops, by being turned over wires, which are afterwards withdrawn, and the loops thus left standing above the basis form the figured surface of the carpet. This will be better understood by reference to the diagram, fig. 1, which is a slightly magnified section of a Brussels carpet, cut across the wires and the threads of the weft. The large dots above are the sections of the wire; the smaller dots, those of the weft or shoot threads; the waved lines, the warp; and the parallel lines, the five coloured worsted threads; and the loops over the large dots are the updrawn worsted threads forming the surface of the carpet. The machinery and processes by which this arrangement is produced are rather complex, and require to be seen to be fully understood.

Carpet Weaving.

The *Wilton Carpet* is made like the Brussels, but the wire has a groove in its upper surface, fig. 2, and instead of being drawn out, it is liberated by passing a sharp knife through the worsted loop into this groove, and thus making a velvet pile surface instead of the looped thread.

The *Venetian Carpet* is produced in a common loom, and the pattern is all in the warp, which alone is visible, as it encloses the weft between its upper and under surfaces. The patterns are generally checks or stripes; the latter are chiefly used for stair carpets.

The *Ditch Carpet* is a coarser and cheaper variety of plain Venetian, sometimes made wholly of hemp, or of a mixture of coarse wool and cow-hair.

The *Kidderminster* or *Scotch Carpet* has usually a worsted warp and woollen weft, and the pattern is made by the combination of the colours of each. Three-ply C. of this kind are made especially in Kilmarnock. This is the most durable of the moderate-priced C., the patterns are not so brilliant as those of the Brussels or the Tapestry, but, being ingrained and woollen throughout, they retain their character until worn through. This, and the three immediately preceding descriptions of carpet, exhibit their patterns nearly similar on both sides, and are therefore reversible.

*Whytock's Tapestry and Velvet Pile Carpet*, as it is now frequently called, is becoming very extensively used as a cheap substitute for Brussels and Wilton, which it is made to resemble very closely in the brilliancy and variety of pattern. The manufacture of this carpet is very curious and ingenious. Instead of five coloured yarns, only one of which is drawn to the surface at any one place, while the other four remain buried between the upper and under threads of the cloth basis, a single coloured yarn is used, and the variety of colour produced by dyeing it of various colours at intervals of its length. The yarn is coiled upon a drum, and printed by means of rollers in such a manner that when the threads that encompass the roller shall be uncoiled and laid in lines side by side, they shall present an elongated printing of the pattern, so that a rose, for example, the outline of which should be nearly circular, will be an oval, with length equal to four times its breadth. When, however, the thread is looped over the wire, four inches of yarn being used for an inch of the carpet pattern, this elongation is exactly

compensated, and the rose appears in its proper proportions. The machinery required for this is, of course, much simpler than that for the Brussels, only one yard having to be looped, and that always in the same manner.

The *Printed Felt C.* are, as the name implies, simply made by printing colours on felt. These are chiefly used for bedroom carpets.

A very beautiful fabric has also been introduced, called the *Patent Wool Mosaic*, formed by cementing a velvet pile upon plain cloth. It is used for rugs, &c. The pile is formed by stretching lengths of woollen yarn between plates of finely perforated zinc, placed several yards apart, the colours of the threads being arranged so that their ends shall shew the pattern. The mass of yarn is then enclosed in a case, open at both ends, and compressed without deranging the fibres; and by means of a piston or ram at one end, a portion of this mass of yarn is forced forwards, the ends thus projecting are glued to the plain cloth, and when dried, are cut off to the length required for the pile. In this manner, several hundred slices are made from one setting of the yarn mosaic, and as many rugs produced.

CARPI, a town of Northern Italy, 10 miles north of the city of Modena. It is surrounded by walls, defended by a citadel, has a cathedral, and manufactures of silk and straw hats. Pop. 5000.—CARPI is also the name of a town of Venetia, in the province of Verona, 28 miles south-east of Verona, celebrated for the victory obtained here by Prince Eugene over the French in 1701. Pop. 1200.

CARPINI, JOHANNES DE PLANO, a celebrated Franciscan monk, born in Capitanata, Naples, about 1210; was one of the six friars selected by Pope Innocent IV. to proceed to the court of the emperor of the Mongols, whose warlike advances in 1246 threw Christendom into consternation, in order to pacify the terrible nomadic warriors, and, if possible, convert them to Christianity. The mission, accomplished under dreadful hardships, though without results so far as its main objects were concerned, was nevertheless far from unfruitful. Prior to this, the most monstrous fables had prevailed regarding the Tatars; and C.'s narrative, which gave a truthful and striking picture of their numbers, character, and civilisation, was the first to bring these myths into discredit. In this book he also argued, with great good sense, for a union amongst Christian princes, as the only means of resisting those fierce hordes in their progress westward. As a book of travels, its accuracy has been attested by modern travellers. Hakluyt copied most of this work, at second-hand, into his first volume of *Navigations and Discoveries*. The date of C.'s death is not certainly known.

CARPINNO, a town of Southern Italy, in the province of Foggia, 22 miles north-east of San Severo, with a population of about 6000.

CARPOCRATES, or CARPOCRAS, flourished under Hadrian (130 A. D.) at Alexandria, where he founded the Gnostic sect of Carpocratians. According to him, the essence of true religion consisted in the union of the soul with the Monas or highest God, by means of contemplation, which elevated it above the superstitions of the popular faith, and liberated it from the necessity of submitting to the common laws of society. He only is to be reckoned wise who attains to this. Among those who have done so, are Jesus, Pythagoras, Plato, and Aristotle. The cosmogony of C. was of the usual Gnostic character, the central peculiarity of which was the belief that the worlds were created by angels. C. also held the doctrine of the transmission

CARPOLITES—CARRIAGE DEPARTMENT.

of souls. His followers existed down to the 6th century. Whether or not they were guilty of the abominations ascribed to them, is more than we can positively affirm; our only information concerning them being derived from *orthodox* writers, who were in the habit of slandering heretics.

CA'RPOLITES, a generic term applied to fossil fruits, which, in the present state of our knowledge, it is impossible to refer more precisely to their place in the vegetable kingdom. 100 species of such fruits have been described, 70 of which belong to the carboniferous system.

CA'RPU. See EXTREMITY.

CARRA'CA, LA, a town of Andalusia, Spain, one of the chief naval arsenals of the kingdom, is situated 4 miles east-south-east of Cadiz. It has been completely isolated from the mainland by artificial means; and so low is its situation, that it was necessary to erect the buildings on piles. It is defended by four forts, and is altogether very complete as an arsenal.

CA'RRA'GEEN, often incorrectly called C. Moss, or IRISH MOSS, a sea-weed (natural order, *Alge*; sub-order, *Ceramiaceæ*), or rather several species of sea-weed, now used to a considerable extent both medicinally and as an article of food. The name C. is originally Irish; and the use of these sea-weeds appears to have been entirely confined to the peasantry of the coasts of Ireland, until about thirty years since they were recommended to general notice, and their medicinal virtues proclaimed by Mr Todhunter, of Dublin. They are, however, found on the rocky sea-shores of most parts of Europe, and of the eastern coasts of North America. The

is procured. Milk may be employed, instead of water, in the preparation of the various decoctions; and with the stronger one, along with sugar and spices, when thrown into a mould, a kind of *blanc mange* is obtained. C. is valued on account of its emollient and demulcent properties, and is likely to be found useful in most of those cases in which iodine might be exhibited; but its value seems to depend not a little on its being at once nutritious, a pleasant article of food, and easy of digestion. See NUTRITION. It has been much recommended in pulmonary consumption. In some parts of Ireland, C. boiled with water (mucilage) is used instead of size for mixing with the more common colours in house-painting.

CARRARA, a town of Northern Italy, 60 miles south-west of Modena. It is situated on the Avenza, near its mouth in the Mediterranean, and is surrounded by the marble hills which have made its celebrity. Many of the principal buildings are wholly or partially constructed of the inferior kinds of white marble. There are upwards of 30 marble quarries in the vicinity of the town, but not more than 6 or 7 furnish the marble used for statuary. Extensive works, fitted up with English machinery for sawing the marble, have been established near the town, in which are several shops for the sale of marble ornaments. Many foreign artists have set up their studios here, in order to save the expense which the export of the marble in its rough state entails. C. has a fine collegiate church of the 13th and 15th centuries, with some good sculptures, an academy of fine arts, and a population, in 1872, of 23,827. The quarries have been worked for more than 2000 years.

The famous CARRARA MARBLE is a white saccharine limestone, which derives its value to the sculptor from its texture and purity. It was formerly supposed to belong to the Primitive rocks, but is now known to be a limestone of the Oolitic period, highly altered by plutonic action.

CARREL, ARMAND, a celebrated French publicist and republican leader, was born at Rouen in 1800, and was educated in the military school of St Cyr. After serving for some years in the army, he went to Paris, and devoted his attention to political and historical studies. In 1830, in connection with Thiers and Mignet, he became editor of the *National*, the most spirited and able of the journals opposed to the government of Charles X. C.'s colleagues being employed by the new government, he was left to conduct the *National* himself, which he did with a spirit and a freedom such as had not been witnessed in France for a long time—which on more than one occasion checked the arbitrary power government attempted to exercise, and gained for him the high admiration and esteem of the popular party. Government prosecutions of course followed his outspokenness, and heavy fines were decreed against him; but these were paid by public subscription, and each conviction only made his journal more famous. C., however, dreaded revolution as much as he hated despotism, and had no sympathy with many of those who looked up to him as a leader. Provoked into a duel with Emile de Girardin, by an attack on his personal character, C. was mortally wounded, and died July 24, 1836. His funeral was attended by many of the most distinguished men in France.

CARRIAGE. See COACH, CART, WAGON.

CA'RRIAGE DEPARTMENT, ROYAL, at Woolwich, is one of the great national manufacturing establishments maintained for warlike armaments—one of those concerning which it is still

Carrageen Moss (*Chondrus crispus*).

species which principally constitutes the C. of commerce is *Chondrus crispus*, of which the varieties are remarkably numerous. It is 2—12 inches long, branched by repeated forking, cartilaginous, flexible, reddish-brown. *C. mamillous* also frequently occurs. C., after being collected, is washed, bleached by exposure to the sun, dried, and packed up for the market. Its composition is as follows :

Vegetable jelly (carrageenin),	79·1
Mucus,	9·5
Two resins,	0·7
Ash,	3·0
Fibre and water,	8·7
	100·0

When treated for ten minutes with cold water, in the proportion of half an ounce of C. to three pints of water, and then boiled and strained, it yields, with or without spices, a very pleasant drink. With a larger proportion of C., a thickish liquid or *mucilage* is obtained; and on boiling down this strong decoction, and cooling, a stiff *jelly*.

## CARRICAL—CARRIER PIGEON.

an unsolved problem whether it is better and cheaper to manufacture by the government or by contract with private persons. This department was organized as a distinct establishment in 1803, and has been undergoing gradual enlargement ever since. Its primary work was that of making gun-carriages; but it now manufactures a great variety of articles in wood, more than half of which are for the use of the navy. Until 1854, the Board of Ordnance had power to lend or to refuse the services of the C. D. to the Admiralty; but since that year the matter rests with the War Office. The works, store-rooms, and yards are of vast size, often employing from 2000 to 3000 hands. More than 10,000 pairs of wheels are made annually, besides all the other articles in wood. There are more than 20 steam-engines in various parts of the establishment; and the wood-cutting and shaping machines are of the highest order of excellence. See GUN-CARRIAGE.

CARRICAL, or KARIKAL, a French port within the limits of Tanjore, a district of the presidency of Madras. It stands in lat.  $10^{\circ} 55' N.$ , and long.  $79^{\circ} 53' E.$ , on the estuary of a small branch of the Cauvery, a tributary of the Bay of Bengal. C. is accessible from the sea only after the periodical rains, and then only for coasting craft. The town and territory contain 63 square miles, and about 50,000 inhabitants. The settlement, originally ceded to France by a native grant in 1759, and subsequently subdued by the British, was restored in 1814, on condition of being neither fortified nor garrisoned.

CARRICKFERGUS, a seaport town of Ireland, is situated on the Lough of Belfast, about 10 miles distant from the town of that name. Though locally within the county of Antrim, it forms a county of itself. C. extends nearly a mile along the north-western shore of the Lough. Its chief feature is its castle, a fine picturesque object, supposed to have been erected by De Courcy in the 12th century. It is situated on a rock about 30 feet high, projecting boldly into the sea, by which it is surrounded on three sides. The bailey or keep is 90 feet in height. From the top of the keep a splendid view is obtained, extending, in a clear atmosphere, to the Mourne Mountains and the Scotch coast. The castle contains a barrack, bomb-proof magazine, and ordnance store-rooms; and for many years, 22 pieces of ordnance, 12-pounders, were mounted on the works. At present, a total change is being made in the defence of the castle, and cannon of a very large calibre are to be mounted, which will command the entrance of the Lough. In 1675, a wall 16 feet high and 7 thick, with 7 bastions, to surround the town, was commenced, and completed in the year 1608; a considerable portion of the wall is still standing, and one of the four entrance-gates. On the 14th June 1690, King William III landed here with his army, twelve days before the battle of the Boyne. The rock on which the king stepped on landing is at the end of the quay, projecting from it, and still forming the landing-place. In 1760, Commodore Thurot captured the castle, but on the approach of troops from Belfast, was forced to abandon it. The parish church, said to have been founded in the year 1164, on the site of a pagan temple, is a fine old building, dedicated to St Nicholas. There are several other churches and chapels in the town, and several good day and Sunday schools in connection with the religious bodies, and a fine model school has just been erected by the National Board. There is a Literary and Scientific Society, with reading-room, library, and museum. The fishery of the bay, which is famous for oysters of an unusual size, employs a good number of the inhabitants. There

are four spinning-mills, one for weaving linen, one bleaching establishment, a starch manufactory and a tan-yard. A market is held every Monday and Saturday, and a fair twice a year. Pop. (1871) 9452. The town returns one member to parliament. There are several barrows or tumuli in the vicinity. C. is connected by railway with Belfast, Portrush, and Larne. A few years since, a shaft was opened by the Marquis of Downshire, in the hope of finding coal—with success; but salt of a superior quality, and in great abundance, was found. A company has been formed, and are working the mine. The length and breadth of the county are nearly equal—about 5 statute miles.

CA'RRICK-ON-SUIR, a town of Tipperary, situated, as its name implies, on the Suir, which is navigable at this point, 12 miles east of Clonmel, in the midst of very fine scenery. Pop. (1871) 8055. C. was formerly celebrated for its woollen manufacture, which has recently been considerably revived, and there are also linen and flax factories. It exports much agricultural produce. The town has recently much improved. C. became a place of note soon after the Norman Conquest. There are the remains of a castle built in 1309, on the site of an old priory of the Knights of St John of Jerusalem.

CARRIER, JEAN BAPTISTE, one of the most infamous and blood-thirsty members of the French National Convention, was born at the village of Yolai, near Aurillac, in Haut-Auvergne, in 1756. Entering the National Convention in 1792, he took an active part in the formation of the Revolutionary Tribunal, voted for the death of the king, demanded the arrest of the Duke of Orleans, and assisted in the overthrow of the Girondists. At Nantes, whither he was sent on a mission against the moderates, in October 1793, he found ample means for indulging his insatiable thirst for human blood. The utter defeat of the Vendees had filled the prisons with captives, and C. proposed and carried a resolution for murdering the unhappy prisoners *en masse*. Accordingly, on November 16, he compelled 94 priests to embark in a vessel, under pretence of deportation, and during the night drowned the whole of them, by having the ship scuttled. Another of these *Noyades*, as they were called, in which 138 persons were sacrificed, took place soon after, and they were repeated to the number of 25, their perpetrators facetiously terming them 'vertical deportations.' Other cruelties C. committed here. Men and women were tied together feet and hands, and thrown into the Loire; and this was called *mariage républicain* (republican marriage). With such recklessness were these murders committed, that, in one instance, a number of foreign war-prisoners were drowned by mistake. The water of the Loire was so poisoned by corpses, that its use for drinking and cooking was prohibited. 500 political prisoners were shot, as in a butte, on the bridge near Nantes. Even Robespierre was offended by these enormities, and recalled C., who boldly justified his own conduct before the Convention. The fall of Robespierre was, however, soon followed by outcries against Carrier; judgment was decreed against him, and he perished under the guillotine, December 16, 1794—dying with the protestation that, in all his cruelties, he had acted according to orders, and as a true republican patriot.

CARRIER PIGEON, a variety of the domestic Pigeon (q. v.), remarkable for the degree in which it possesses the instinct and power of returning from a distance to its accustomed home; and which has been, therefore, much employed to convey messages from one place to another. In Eastern countries,

where such messengers are most frequently employed, it is the practice to bathe the pigeon's feet in vinegar to keep them cool, and to prevent it from alighting in quest of water, by which the letter might sustain injury. Pigeons intended for this use, must be brought from the place to which they are to return, within a short period, not exceeding a fortnight of their being let loose, and at a time when they have

Carrier Pigeon.

young in their nest; the remarkable fecundity of the C. P. affording particular facilities for its employment in this way. The bird is also kept in the dark and without food, for at least eight hours before being let loose. The instinct by which it is guided, like most other instincts, has received no sufficient explanation. That it recognises objects by sight, and so directs its course, is nothing more than a conjecture, and as such, is only very partially supported by the fact of the great power of vision which these birds, in common with so many others, are known to possess, and by that of the C. P., on being let loose, immediately rising spirally to a great height in the air, as if to obtain opportunity for the exercise of this power. The C. P. has probably been more used in the Turkish dominions than in any other part of the world, and during the siege of Paris in 1871, it safely conveyed many important messages. Its rate of flight is not less than thirty miles an hour, and it has been known to pass over great distances still more rapidly. The variety generally described as the C. P. (*Columba tabellaria* of Linnaeus, *C. Turcica* of some authors, but not generally regarded by naturalists as a distinct species), is of remarkably large size, about fifteen inches in length from the point of the bill to the extremity of the tail, and has the cere very large and carunculated, the eyes surrounded with a broad circle of naked red skin, and the wings reaching nearly to the extremity of the tail. There is, however, a smaller variety, which is said to be superior to it, and which has not the carunculated cere, nor the broad circle around the eye. Carrier pigeons are trained by being conveyed, when young, to short distances of a few miles from home and then let loose, the distance being gradually increased; and this training is said to render them much more secure as messengers.

**CARRIERS**, a class of persons who, in various forms, by land and sea, undertake the carrying of goods, particularly articles of commerce. In all countries aspiring to commercial intercourse, the **CARRYING TRADE**, as it is called, has been less or more developed. The method of carrying in Arabia, Persia, and some other countries in the east has, till the present time, been chiefly by means of the camel, an animal of great value, on account of its strength, patience, and power of endurance.

See **CAMEL**. In England and Scotland, previous to the general use of wheel-carriages, goods were carried on pack-horses, as is still practised in some parts of Spain with mules. See **PACK-HORSE**, also **MULE**. After the pack-horse came the one-horse cart and the four-wheeled wagon, as engines of land-conveyance. Carrying with one-horse carts settled down as a universal practice in Scotland, where it is still conducted in all districts not traversed by railways. The Scotch C., winding their way by roads over hill and dale, at the rate of about 20 miles a day, have ever been a respectable and useful body of men, exceedingly trustworthy, and moderate in their charges. In connection with Edinburgh, Glasgow, and other centres of traffic, they travel to and from provincial towns for the most part once a week on certain days, so that their arrival at any particular place may be reckoned on with great exactness. In England, the employing of wagons for carrying goods in connection with the metropolis and provincial towns is now of old date. These carriers' wagons, greatly limited in their range by the introduction of canals and railways, are still to be seen in some of the rural districts. A wagon of this kind is provided with four broad huge wheels; and being a heavy and clumsy engine of conveyance, is drawn by four

Covered English Wagon.

horses, though, when roads were bad in old times, six horses were not unusual. The driver ordinarily rode on a pony alongside the vehicle; now he more frequently walks, carrying a long whip. The wagon has a hooped top with movable covering; and the hinder part has always been left vacant for the use of passengers, who are necessarily huddled together on straw. Travelling in the 'tail of the wagon' is now entirely gone, or nearly so; but with all its rude inconveniences, it was common till past the middle of the 18th c., and has afforded scope for some of the most grotesque descriptions of Fielding and Smollett. The tedious process of carriage by these wagons largely increased the prices of goods, and retarded the growth of commerce. The first modification in the carrying trade took place by means of inland navigation, to which reference has already been made. See **CANAL**. The conveyance of cotton goods from Lancashire, of earthenware from Staffordshire, of metal goods from Birmingham, of salt from Cheshire, &c., became much more easy than before, owing to the large quantity which could be packed in each barge, and to the great amount of work done by each horse. The chief owners of the old wagons became, in time, the chief owners of the canal-boats; they paid rates or tolls to the canal companies. The celebrated English firm of Pickford & Co. has been for many generations, and still is, at the head of the goods carrying trade.

When railways were established, a great struggle ensued; the owners of the road-wagons and canal-barges had a formidable competition. They wisely accommodated themselves to a state of things which they could not prevent, and added the trade of railway goods C. to their former business. Three

systems were tried: 1. The company purchased road-wagons or vans, collected goods at the various towns, conveyed them by railway, and then distributed them at their several destinations. 2. The company confined their attention to the mere conveyance on their railway, leaving the collection and delivery to the ordinary carriers. 3. The company combined both systems, conveying on the railway everything that offered, and competing with the C. for the road-traffic. During the greater portion of the period in which the railway system has been in operation, the second of the above three plans has been adopted more extensively than either of the others. Taking as examples the greatest railway company and the greatest carrying firm, Messrs Pickford had warehouses or dépôts at all the principal towns where the London and North-western Railway had stations. The merchants and manufacturers were customers, not to the company, but to the firm, for the conveyance of merchandise. Messrs Pickford employed their own wagons and horses, clerks and porters, in collecting and delivering goods, and paid to the company so much per ton for the conveyance along the railway, the toll varying according to the nature of the goods and the distance run. There were seldom any quarrels or disputes under this system. The carrier was responsible to the customer from first to last for the safety of the merchandise; and he had a claim against the company for any injury while the merchandise was on the railway. Under the third system, disputes were much more frequent. The companies were bound by law to carry goods for all persons at certain tolls; but when they became road C. as well, they competed with the ordinary C. in a way which the latter could barely contend against. The Great Western Railway has been unfavourably distinguished for jealousies and law-suits between the company and the carriers.

At the present time, the tendency is for the companies to take the responsibility of the whole conveyance, the C. acting as their agents, if willing so to do, or else endeavouring to maintain a fair competition. One of the greatest of the companies, the Midland, have in this way become C. on their own account, in order to obtain a share of the profit which accrues from road-traffic. The goods-vans traversing the streets of the metropolis, and other great towns, are now more frequently inscribed with the names of railway companies than with those of private carriers.

The goods-dépôts of the several railways are scenes of great activity during the night; for it is then that the arrival-trains are mostly unpacked, and the departure-trains mostly made up. During the day, vans are collecting goods from manufacturers and warehouses; these goods are sorted at the dépôts, and are, when evening comes on, distributed among different trains, according to the part of the country to which they are to be conveyed. On the other hand, goods-trains arriving during the evening and night are unpacked, the goods classified according to districts, and sent out for delivery by road-vans on the following day.

The four-horse broad-wheel wagons, as already said, have almost disappeared from English roads; vans of lighter construction sufficing to convey merchandise from and to the various railway stations. Canals still command a trade, but it is chiefly in coal, stone, lime, ore, slate, bricks, and other articles very bulky in proportion to their value. The conveyance of manufactured goods has, for the most part, passed over to the railways.

In towns, there are C. whose business is confined wholly to short distances. Taking the metropolis as an example, there are C. residing in all the

villages and hamlets round about, each possessing one or more single-house covered carts. Every morning the cart, containing miscellaneous articles collected in the village or hamlet, goes to London, and delivers each article at the particular house or establishment to which it is addressed. When thus emptied, it receives a supply of packages or other articles going from London to the suburbs, and makes its return-journey in the evening. The plan is cheap and convenient, and does not seem likely to be supplanted by any other; for no amount of railway extension would wholly accommodate short traffic. For the metropolis more strictly, however, an excellent system has been established by the 'London Parcels Delivery Company.' Two or three times a day, parcels are conveyed from receiving-houses all over the metropolis to a central dépôt near Fetter Lane, there sorted, and sent out again for delivery. The metropolis, out to a wide distance, is separated into districts, and one or more carts, filled with parcels, are sent to each district at certain hours of the day. The speed is rapid, the times are punctual, and the service in general well conducted. The suburban C. have arranged among themselves a sort of central dépôt or 'house of call' in the Old Bailey, for the exchange of traffic; but their system is not so well organised as that of the company just named.

The progress of improvement in the English CARRYING TRADE is a type of the advances similarly made in the United States, where canals, railways, and coasting steam-vessels have generally superseded the old tedious methods of conveyance; and it is chiefly on the long and almost trackless routes to the shores of the Pacific that are now seen the old processes of carriage by pack-mules and horses and bullock-wagons, the cost of transit by these means being very great.

The term CARRYING TRADE has latterly been applied more specially to all kinds of conveyance of merchandise by sea, whether across the ocean or along the coast. In this broad view, it, in reality, involves the whole question of mercantile marine, British and foreign.

CARRIERS, LAW RESPECTING. A carrier, in Law, is one who offers to the public to convey passengers, or goods, from one place to another, for hire. The offer must be general—for a private person who contracts with another for carriage, is not a carrier in the legal sense, and does not incur the peculiar responsibilities which, in almost every country, it has been found expedient to attach to the occupation of a public or common carrier. Carriage, in law, is thus a peculiar modification of the contract of hiring. In Rome, the responsibilities of carriers by water were regulated by a prætorian edict, which was applicable also to innkeepers and stablers (Nautæ, Cauponæ, Stabularii, Dig.; lib. iv. t. 9); and from that edict the law of carriage in modern Europe has been mainly borrowed, sometimes directly, as in Scotland, sometimes indirectly, as in England. The ground on which the edict increased the responsibilities attaching to an ordinary contract of hiring was, that the persons whom it enumerated were under peculiar temptations to consort, either personally or through their servants, with thieves and robbers, without the connection being such as to admit of proof; and that the public safety consequently required that they should be held responsible for whatever had been intrusted to them, till its safe delivery at the place to which they had undertaken to convey it. This responsibility in our own law extends not only to the acts of the carrier's servants, but also to those of the other guests in an inn, or the other passengers in a conveyance. The only exception to this liability

## CARRION CROW—CARROT.

at common law is in the case of loss arising from the act of God or of the Queen's enemies—i. e., from the fury of the elements, or from war. But several statutory limitations have been introduced. There is no liability for articles of unusual value or fragility, unless an increased hire has been paid, expressly as insurance, in consequence of the greater risk (11 Geo. IV., and 1 Will. IV. c. 68, and 17 and 18 Vict. c. 31); and the proof of value is laid on the person claiming compensation. But the last-mentioned act, commonly called the Railway and Traffic Act of 1856, provides, on the other hand, that the company shall be liable for neglect or default in the carriage of goods, animals, &c.; notwithstanding any notice or condition or declaration made by the company, for the purpose of limiting their liability. The decisions of the courts have also somewhat limited the universal responsibility of the carrier. For example, it has been decided that he is not liable, *qua* C. (and the same applies to an inn-keeper), for money taken from the pockets of the traveller; but that, if the money has been taken from the pockets of clothes which have been stolen, or from trunks which have been broken into, his responsibility comes into operation.

Under C. are included carters and porters, who offer themselves for hire, to carry goods from one part of a city to another. Whether the same be the case with hackney-coachmen, is more doubtful; though, from the extent to which they are now employed in the transport of luggage, there seems no sound reason for an exemption in their case. Wharfingers and warehousemen are liable only under the special contracts into which they may have entered, or in accordance with mercantile usage. In England, it has been decided that lodging-house keepers are in a different position from carriers and innkeepers, on the ground that they do not profess to entertain all-comers, or to receive their goods. C. are liable to make good to the owners of goods intrusted to them all losses arising from accidental fire. This rule was introduced into Scotland by the Mercantile Law Amendment Act of 1856; but it has not been decided whether an exception would be made in the case of fire occasioned by lightning. It is probable, however, that the English rule, by which this occurrence is excepted as the act of God from the category of ordinary accidents, would be held to rule the construction of the general words of the 17th section of the Scottish statute.

CA'R'RION CROW. See CROW.—C. C., also called *Black Vulture*, is not in America, as in Britain, the name of a species of crow, but of one of the Vulture family. See VULTURE.

CARRION FLOWERS, a name which, on account of their smell resembling that of putrid meat, has been given to the flowers of many species of *Stapelia*. The genus *Stapelia* belongs to the natural order *Asclepiadæa*, and is remarkable for the excessive development of the cellular tissue of the stem and reduction of that of the leaves, resulting in a general aspect like that of the *Cactus* family. The species are natives of the Cape of Good Hope. The flowers are often large, and not devoid of beauty, but the carrion stench is very strong. It is not yet known to what chemical substance it is owing.

CA'R'RON, a village in Stirlingshire, Scotland, on the right bank of the Carron Water, 3 miles east-north-east of Falkirk. It is celebrated for its ironworks, which are among the largest of the kind in Britain. The works were established in 1760; and are carried on by a company, who employ a great number of men. Pop. (1871) 1088.

## CARRON OIL. See BURNS.

CARRONADES are short iron guns, invented by Mr Gascoigne, and named after the Carron Iron Works in Scotland, where they were first made. They are lighter than ordinary guns, and have a chamber for powder, like mortars. They were made standard navy guns in 1779, to be carried on the poop, forecastle, and upper works. Being manageable by a smaller number of hands than guns, and being very useful in close engagements, they were held in much favour during the great war: the seamen called them 'smashers.' A 68-pounder carronade weighed not much more than half as much as the 42-pounder gun in use in 1779. They range from 68-pounders down to 6-pounders. The denominations, weights, lengths, calibre, &c., of the chief varieties of carronade are noticed under CANNON.

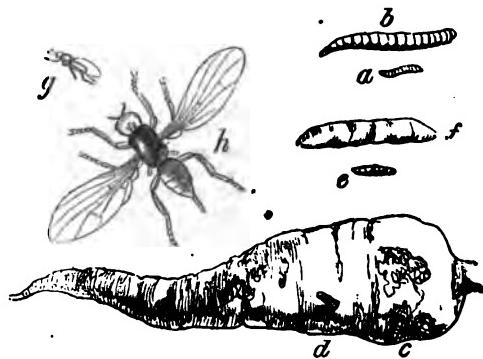

Some C. are made shorter with a given bore. C. are but little used, except by the English and French. Though valuable at close quarters, they are no match for long guns at a distance; and therefore a ship armed only with C. would fare badly in a general action. In recent years, C. have to a considerable extent been replaced in the English navy by howitzers, long guns, and shell guns.

CA'R'ROT (*Daucus*), a genus of plants of the natural order *Umbelliferae*. They are mostly natives of the countries surrounding the Mediterranean Sea. The Common C. (*D. Carota*), is a biennial plant, common in Britain and most parts of Europe, also in the Caucasus; and is universally cultivated not only in Europe and the European colonies, but in China, Cochin China, &c., for the sake of its root. The root of the wild plant is slender, woody, and of a very strong flavour; that of the cultivated variety is much thicker and more fleshy, much milder in its flavour and qualities, generally red, but sometimes orange or yellowish white. The sub-varieties in cultivation are also distinguished by their form—some being longer and more tapering than others—by their size, and by the duration of their growth; the early kinds being also comparatively small, and almost exclusively cultivated in gardens for culinary use, whilst the larger and late kinds are often also grown in fields, for feeding cattle. The field cultivation of the C. is carried on to a much greater extent in some parts of France, Germany, and Belgium, than in Britain; but it is increasing in Britain. The C. appears to have been cultivated at an early period in Flanders and Germany, and to have been introduced into the gardens of England in the beginning of the 16th century. In the reign of Charles I, ladies wore C. leaves as an ornament instead of feathers; and the beauty of the leaves is still occasionally acknowledged by placing a root, or the upper portion of one, in water, that it may throw out young leaves to adorn apartments in winter. The C. prefers a light and rather sandy soil, and often succeeds very well on a peat soil. It is very liable to the attacks of the larva of the Crane Fly (q. v.), by which the greater part of a crop is sometimes destroyed when the young roots are about the thickness of a quill; on which account, in gardens where there is particular reason to apprehend danger from this enemy, it is the practice to make a number of successive sowings, some of which may probably escape. As an article of food, C. contains a large amount of what are called heat-producing compounds, with a small proportion of flesh-forming matter. It consists essentially of starch, sugar, and albumen, along with a volatile oil, which communicates a flavour to many dyspeptics.

very unpleasant. The following is the composition of dried carrot:

Starch and sugar,	93.71
Albumen,	4.35
Red neutral substance (carotin),	0.24
Fixed and volatile oils,	1.00
Ash,	0.60
	100.00

C. is easy of digestion, and gently laxative. Boiled C. is used as a poultice for foul ulcers and other sores, and as a vermifuge. Grated C. forms an agreeable cooling, but also stimulant application. A sirup is prepared from carrots; and when cut into small pieces and roasted, they are occasionally used in Germany as a substitute for coffee. A strong ardent spirit is distilled from them in some parts of Europe, 10 lbs. of carrots yielding about half a pint. C. seeds are employed as a diuretic, also as a carminative and stimulant; those of the wild C. being preferred.—Besides the crane fly, already noticed, carrots have numerous other insect enemies. One of the most troublesome is the CARROT FLY (*Psila rosea*), a small dipterous fly, the larvae of which, by eating away the surface of the

Carrot Fly (*Psila rosea*): \*

root, cause what is commonly known as *rust* in carrots, and prepare them for the further operations of millipedes and other destroyers. The larvae of several species of moth (*Depressaria*) are very injurious to them when in flower and seed. An aphid (*A. dauci*) often kills the young plants.

CARROU'SEL (Fr.), a species of knightly exercise, which, down even to the beginning of the 18th c., was very common in all the courts of Europe. C. was a kind or imitation of the tournament, and for a time after the discontinuance of the latter seems to have supplied its place. The dresses, for the most part, were those of the knights of former times, and the combatants, or rather competitors, were divided into two parties, usually according to their different nationalities. One of the favourite exercises in France consisted in running at the pasteboard head of a Moor or Turk with a lance, cutting it down with a sword, or firing at it with a pistol. Another of these tests of skill and horsemanship, if not of courage, consisted in carrying off a whole line of rings, which were suspended for the purpose. The C. in France was not known earlier than the reign of Henry IV.; but it had existed for some little

\* For the accompanying illustration, and many others of a similar nature throughout this work, we are indebted to Morton's *Encyclopaedia of Agriculture*.

time previously in Italy. There were brilliant carrousels under Louis XIII., and two celebrated ones were given in honour of Mademoiselle de la Vallière—the one at Paris in 1662, the other at Versailles in 1664. The place where the first of these fêtes was held, has ever since been called the Place du Carrousel. A revival of the C. was attempted at Berlin in 1750; and in 1828 the Cavalry School at Saumur held one in honour of Madame la Duchesse de Berry. The so-called Eglinton Tournament—an entertainment given some years ago by the chivalrous Earl of Eglinton—was in reality a carrousel.

CARSE is a term applied in Scotland to low lands adjoining rivers. The word is of uncertain origin. In Stirlingshire, it is restricted in its sense to the level alluvial soils which are only a few feet above the river Forth. In Perthshire, it also applies to the whole of the slightly undulating lands to the north of the Tay, which form the C. of Gowrie. C. soils usually consist of argillaceous deposits, which produce crops of great luxuriance, although there are some which consist of hungry and barren clays. The richest of them are of a hazel colour, and become friable when exposed to the action of frost; the poorest, on the other hand, are of a yellow colour, containing little vegetable matter to render them amenable to cultivation. The best kinds of C. soils are generally farmed on the six-course shift—1. Grass; 2. Oats; 3. Beans; 4. Wheat; 5. Potatoes; 6. Turnips or Fallow. Large crops of grass are grown when the clover-plant catches. It is mostly made into hay, and the after-math is used for soiling horses and cattle in the straw-yards. The land is seldom pastured, as the feet of animals trample and destroy the grasses, when the weather is wet. The oat-crop is more uncertain on the carses, but in favourable years, the yield is large, and the quality of the grain is excellent. Beans are very successfully grown, indeed the best of the C. soils are the best bean-soils in Scotland. Where the land is rich, and not too stiff, the potato is sometimes largely grown. On the poorest description of the C. soils, the potato does not thrive. Wheat can be grown in closer succession on the C. lands, than on any other description of land with the same expenditure of manure. A large stud of horses are required on C. lands, to enable the farmers to prepare the land for the various crops, at the moment when the season suits. A small portion of the land is still usually summer-fallowed, as it is found that it cannot be kept thoroughly clean by green crops in rainy seasons.

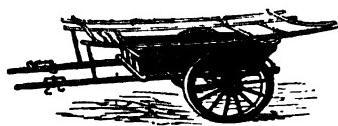

CARSTAIRS, WILLIAM, a distinguished political and ecclesiastical character of the 17th c., who took a very active part in bringing about the Revolution of 1688, was born at Cathcart, near Glasgow, February 11, 1649. He was educated at the village school of Ormiston, in East Lothian, and subsequently at the university of Edinburgh, where he displayed a remarkable aptitude for learning. In his 24th year, Scotland being then in a most unsatisfactory state, alike from a political and religious point of view, C. went to study theology at Utrecht. His scholarship, polite address, knowledge of men, and great political information, especially regarding his own country, recommended him to the notice of the Prince of Orange, who chose him as his confidential adviser in all matters relating to Britain. In 1682, being in England on a mission of observation from Holland, he was employed to negotiate between the English and Scotch conspirators in the Rye House Plot. With others implicated, he was arrested and put to the torture

of the thumb-screw, but refused to confess anything that had not been previously revealed, and that only on condition that what he said should not be used in evidence, either directly or indirectly, against any other person. At this time, he had secrets from Holland of the greatest importance in his possession, which he carefully concealed, although there can be no doubt that their revelation would not only have saved him from torture, but have obtained for him great reward and honour. Britain, therefore, owes very much indeed to the firmness of C. at this juncture. He returned to Holland about the beginning of 1685; and, acting mainly on his advice, the Prince of Orange planned and carried out the invasion of 1688. He accompanied the prince as chaplain, and after the settlement of the crown, when the prince had been firmly established as William III., C. was instrumental in effecting a reconciliation between him and the Scottish Church, when the ill advice of other councillors had nearly led to an open rupture. From 1693 to the death of the king in 1702, he could not have had more influence in Scottish affairs if he had been prime-minister of the country; and his authority in church-matters was such, that he was popularly called 'Cardinal Carstairs.' He was elected Principal of the university of Edinburgh in 1704, and in this capacity used all his influence with government to obtain an increase of patronage for the Scottish colleges. In the same year, he was presented to the Church of Greyfriars, and was appointed Moderator of the General Assembly next succeeding, an office to which he was four times elected in the course of eleven years. He died August 1715, deeply regretted by the whole nation, and leaving a reputation for scholarship and sincere piety, as well as for unbounded charity and political sagacity rarely equalled.

CARSTENS, AAMUS JACOB, an eminent German artist, was born near Schleswig, May 10, 1754. In 1762 he went to Copenhagen, where, when first introduced to the Royal Gallery of Paintings and Casts from the Antique he was so excited that he shed tears of joy. After staying seven years in the Danish capital, where he produced his 'Baldur's Death,' and 'Eolus and Ulysses,' supporting himself chiefly by portrait-painting, he commenced a journey on foot to Rome, but was obliged to return for want of means after reaching Mantua. He resided in Lubeck for some time, but through the kindness of a wealthy amateur artist named Rodde, he contrived to reach Berlin, where his great composition, the 'Fall of the Angels' (with 200 figures), gained for him an appointment as professor in the academy, while his decoration of a saloon in the Dorville Palace obtained for him an introduction to the king and a pension. He was now enabled to visit Rome, where he devoted himself to the study of the works of Michael Angelo and Raphael. His first work in Rome, a 'Visit of the Argonauts to the Centaur Chiron,' was distinguished by purity of style, beauty of forms, and fine distribution of light. His numerous subsequent drawings mostly represented scenes from the ancient classic poets, with subjects from Ossian, Dante, and Shakspeare. C. died May 26, 1798.

CART, a species of carriage with two wheels, in which respect it differs from the ordinary wagon that has four wheels. There are different kinds of carts, according to the nature of the goods or articles to be carried, and they also differ considerably in different countries. The C. is little seen in England, where the heavy and more capacious wagon takes its place. It is, however, used for

agricultural and other purposes in Cumberland and adjoining northern counties. There, it differs only in a slight degree from the C. universally used in Scotland. The Scotch C. is an exceedingly convenient form of carriage for general merchandise, or for agricultural produce, and well adapted for being drawn on roads in a hilly country. A material advantage consists in its weight, being about only half a ton, while its usual load is from a ton to 22 cwt.; from which circumstance it is a particularly handy vehicle for comparatively light loads, and so far is superior to the English wagon, which is best adapted to carry huge loads of from two to three tons. In carrying hay, straw, or grain from the harvest-field, Scotch farmers employ a peculiar kind of C. without sides to admit of a bulky load; but they also, as occasion serves, use for a similar purpose an ordinary C., on which they place a movable frame, as is seen in the adjoining cut. All grain for

Scotch Cart, with movable frame.

market is carried in the one-horse C., and a driver takes charge of two carts. The following advantages of one-horse carts are well enumerated by Lord R. Seymour: 'A horse, when he acts singly, will do half as much more work as when he acts in conjunction with another; that is to say, that two horses will, separately, do as much work as three conjunctively. This arises, in the first place, from the single horse being so near the load he draws; and in the next place, from the point or line of draught being so much below his breast, it being usual to make the wheels of single-horse carts low. A horse harnessed singly has nothing but his load to contend with; whereas, when he draws in conjunction with another, he is generally embarrassed by some difference of rate, the horse behind or before him moving quicker or slower than himself; he is likewise frequently inconvenienced by the greater or less height of his neighbour: these considerations give a decided advantage to the single-horse cart. The very great ease with which a low C. is filled may be added; as a man may load it, with the help of a long-handled shovel or fork, by means of his hands only; whereas, in order to fill a higher C., not only the man's back, but his arms and whole person must be exerted.' To these just observations it need only be added, that in many parts of England there is a wasteful expenditure in horse-power, a pair of horses being often set to draw a clumsy wagon to market, containing a load which could with the greatest ease be drawn by one horse in a less ponderous machine.

The one-horse C. is employed by carriers all over Scotland, the load being usually piled high in a square form, and covered in with a woolen wrapper, in which state the C. is drawn 18 to 20 miles a day. See CARRIERS. In France and Germany, the carrier's C. is a more gigantic machine. Long in the body, very strong in construction, and poised on two high wheels with broad rims, this continental C. carries enormous loads, almost equal to what are seen in the large wagons of England. The ingenious manner in which the load is adjusted to rest exclusively on the wheels, and so relieve the single horse in the shafts, is matter of surprise to all strangers. All carts, whatsoever, in Great Britain, must bear the name and address of the

## CARTAGENA—CARTHAGE.

owner, painted conspicuously on them, according to statute 1 and 2 Will. IV. c. 22. See WAGON.

CARTAGENA, a fortified seaport of Spain, on a bay of the Mediterranean, in lat. 37° 36' N., long. 0° 57' W. It is built partly on the declivity of a hill, and partly on a plain extending down to the sea, and is enclosed by hills which screen it from all winds. The harbour is one of the best in the Mediterranean, capacious enough to hold the largest fleets. The entrance is narrow, and completely commanded by the fortifications on an island called La Isoletta, on the south. It was formerly the largest naval arsenal not only in Spain but in Europe, but is now decayed and desolata. The city, which is surrounded by walls, has quite a Moorish aspect imparted to it by its old streets, as well as by its Moorish cathedral, and the ruins of an old castle on the top of a hill of the same order of architecture. C. has several well-built and spacious streets, but with one or two exceptions, they are all badly paved. Red marble is so plentiful, that it is used for the commonest purposes. C. has manufactures of sail-cloth and glass, and a trade in barilla, agricultural produce, &c. The tunny fishery is important, and the silver and lead mines, anciently wrought and recently reopened, promise to be again valuable. Pop. 33,593. C., which was a colony of the Carthaginians, was built by Hasdrubal 242 B.C., under the name of New Carthage. It formed the head-quarters of the Carthaginians in Spain, and soon became a city of much wealth and influence. It was captured by P. Scipio in 210 B.C., and became of importance under the Romans, who are said to have employed 40,000 men daily in the mines in the neighbourhood. It was sacked by the Goths, and did not again attain any note until the time of Philip II.

CARTE, THOMAS, an English historian, distinguished for his industry and research, was born at Clifton, in Warwickshire, where his father was parish minister, in 1636. Educated at Oxford, he afterwards took the degree of M.A. at Cambridge, and entering holy orders, was appointed reader at the Abbey Church, Bath; but being attached to the Stuarts, he resigned his office rather than take the oaths to the new government. In 1722, he was suspected of having been concerned in the conspiracy of Bishop Afferbury, whose secretary he was, and £1000 was offered for his apprehension; but he escaped to France, where he remained for some years. On his return to England, he published a life of the Duke of Ormond, remarkable for the fulness of its information. In 1747–1755, he published a *History of England*, bringing it down to the year 1654. This work is very valuable for its facts, but the author had not the capacity to grapple with these philosophically. Hume and other historians, however, have been much indebted to him for the materials of history. Among his other works was an edition of *Thucydides*; and at his death, in 1754, he left behind him 20 folio and 15 quarto volumes of MSS., in further illustration of the history of England to 1688, which have proved of great utility to subsequent writers. These are preserved in the Bodleian Library, Oxford.

CA'RTTEL, during a time of war, is an agreement between the belligerents for an exchange of prisoners. Sometimes the name is given to a ship, called by the French a *bâtimant parlementaire*, commissioned to convey the exchanged prisoners, or to carry messages to the enemy. A ship, when thus employed, must carry no cargo, ammunition, or implement of war, except one gun for signals.

CARTER, ELIZABETH, an English lady, remarkable for her classical attainments, and also for her knowledge of modern languages, was born

December 1717, at Deal, Kent. Slow at first to learn, she afterwards displayed remarkable aptitude. In her 21st year she published a small volume of poems, and in the succeeding year she translated from the Italian of Algarotti *An Explanation of Newton's Philosophy for the Use of Ladies*. These publications brought her into note, and obtained for her the friendship of such men as Bishop Butler, Archibishop Secker, Sir Joshua Reynolds, Burke, and Dr Johnson, the latter of whom especially held her in great esteem, and had the highest opinion of her proficiency as a Greek scholar. A translation of Epictetus which she made, was most favourably received by the literary press of her time, both at home and abroad. She died unmarried, February 1806, at the age of 89.

CARTERET, JOHN, EARL GRANVILLE, a distinguished orator and statesman of the 18th c., was born April 1690, his father being Baron Carteret of Hawnes, Bedfordshire. His education, commenced at Westminster School, was completed at Oxford. From the latter place, according to Dean Swift's humorous assertion, he carried away more Greek, Latin, and philosophy than was at all becoming a person of such high rank. Introduced into the House of Peers in 1711, he spoke in favour of the Protestant succession, and in consequence received the early notice of George L, and obtained some lucrative appointments. In 1718–1719, he was appointed ambassador extraordinary to Sweden, and in the following year succeeded in concluding a peace between Sweden, Prussia, and Hanover. In 1721, he was appointed secretary of state, and in this capacity defended with great zeal the proceedings of government in the Afferbury conspiracy. In 1724, he was made lord lieutenant of Ireland. During his vice-regency, he was in constant intercourse, and held frequent discussion, with Dean Swift about public affairs. His lord lieutenancy, which lasted from 1724 to 1726, and again from 1729 to 1730, was popular, particularly the latter period. From 1730 to 1742, he was one of the most able and determined of the leaders of the opposition in the House of Lords against Sir Robert Walpole, and on his displacement, was made a secretary of state. On the death of his mother in 1744, he succeeded to the title of Earl Granville, and in the same year had to resign his seals of office, the Broad Bottom Ministry (q. v.) expressly excluding him; but he continued to receive marks of the royal favour. C. was a most liberal patron of men of letters. He died January 1763.

CARTHAGE, called *Carthago* by the Romans, *Carchedon* by the Greeks, both of which are but forms of the native name *Karsh-hadha*, i. e., 'New Town' (found on ancient coins), was the greatest city of antiquity on the north coast of Africa, and was situated in what now constitutes the state of Tunis, on a peninsula extending into a small bay of the Mediterranean Sea. It was founded, according to legend, by Dido (q. v.), a Phoenician queen, who had fled from Tyre after the murder of her husband almost nine centuries before the Christian era, but more probably (like the Anglo-Indian Calcutta) it originated in an emporium or *factory* established by the colonial merchants of Utica, and the capitalists of the mother-city Tyre, on account of the convenience of its situation. Unfortunately, we know very little of its growth. Our information only begins after C. had become one of the greatest commercial cities of the world, and we have but very scanty and one-sided accounts of it even then. The number of the inhabitants before its destruction amounted to about 700,000. The

population was partly of Phoenician, partly of Libyan descent. The territory which the Carthaginians acquired by the subjugation of the Libyan tribes, and by the ultimate annexation of other older Phoenician colonies, with which they had at first been simply in alliance, such as Utica, Hadrumetum, Tunis, Hippo, the two Leptes, &c., extended in the middle of the 5th c. B.C. southward to Lake Triton, eastward to the Great Syrtis, and westward to Hipporegus (now Bona). The maritime power of the Carthaginians enabled them also to extend their settlements and conquests to the other coasts of the Mediterranean. In the 6th c. B.C., they were masters of Sardinia, and had begun to contend for the possession of Sicily. Hanno (q.v.) founded colonies on the west coast of Africa beyond the Straits of Gibraltar, and Himilco visited the coasts of Spain and Gaul. The relations of C. to foreign states in earlier times are not very clear. The first treaty with the Romans was concluded in 509 B.C.; the second, in 348 B.C.; the third, in 306 B.C. The connected history of C. begins with the 5th c. B.C., a period of wars between the Carthaginians and the Greeks in Sicily. The Carthaginian army under Hamilcar was destroyed by Gelon at Himera in 480 B.C. It was not till 410 B.C. that the war began which ended in the conquest by the Carthaginians of some parts of the island. Dionysius the Elder, or rather the pestilence working for him, put a stop to their conquests, but did not succeed in expelling them. War raged almost constantly between Dionysius and the Carthaginians. The more feeble reign of Dionysius the Younger afforded them an opportunity of extending their conquests, yet they were frequently repelled and defeated by the Sicilian Greeks; and during 311–301 B.C., Agathocles carried the war into Africa, and attacked C. itself. After his death, the Carthaginians again increased their dominions in Sicily; and although Pyrrhus contended successfully against them at first, he left that island entirely in 275 B.C. The subjugation of the south of Italy by the Romans, brought the two great and conquering nations into collision, and the First Punic war arose, 264 B.C., and after a great naval victory of the Romans, terminated in 241, the Carthaginians giving up Sicily, Sardinia, and Corsica, and paying to the Romans a large sum of money. Soon after this, a mutiny of the hired troops of C., combined with an insurrection of the Libyan tribes, the ancient inhabitants of the country, who were kept down by the arbitrary rule of the Carthaginian colonists, threatened the entire ruin of the city. Hamilcar brought that bloody war, however, to a successful termination, and led an army to Spain, where he, and after him Hasdrubal, obtained great successes. Here was founded New C., now Cartagena (q.v.). After Hasdrubal's death, 221 B.C., Hannibal (q.v.), burning to revenge the defeat which his native city had sustained from the Romans, broke the treaty with them, and took Saguntum, 219 B.C. Thus began the Second Punic war, in which Hannibal pursued his career of conquest from Spain, through Gaul, and across the Alps into Italy itself, defeated the Romans with terrible slaughter in various battles, and, by that of Cannae in particular, brought Rome to the very brink of ruin. Yet the war terminated in the total defeat of the Carthaginians by Publius Cornelius Scipio, who overthrew their power in Spain, and was victorious over Hannibal in the final and decisive battle of Zama, in Africa, in October 202. A peace was then concluded, in which the Carthaginians were limited to their African territories; but most of their ships of war and war-elephants were taken from them,

besides an immense sum of money, and they were taken bound not to make war without permission of the Romans. Massinissa, king of Numidia, skilfully availed himself of dissensions which arose within C. between the nobles and the people, to advance his own interests at the expense of the Carthaginians; and as they (151 B.C.) opposed him, and drove his adherents out of the city, the Romans seized the opportunity for a new declaration of war, 149 B.C., on the ground that the treaty was broken; and after a siege of two years, C. was taken by Publius Cornelius Scipio Aemilianus, 146 B.C. For six days the combat was maintained in the streets of the city, and for seventeen days the work of its destruction by fire was carried on by the conquerors. The country became a Roman province. C. Gracchus sent out 6000 colonists to found a new city on the site of Carthage. It was called Junonia, but it did not prosper. Augustus, carrying out the intention of his great uncle, restored the city, and the new C. had become, in the second and third centuries of the Christian era, one of the finest cities of the Roman empire. In 439 A.D., Genseric made it the capital of the Vandal kingdom; Belisarius conquered it in 533, and named it Justiniana; the Arabs under Hassan utterly destroyed it in 647 A.D.; and now only two or three small hamlets and a few ruins mark its site.

We have not very satisfactory accounts of the constitution of the Carthaginian state. It is certain that it was oligarchical, and that the chief power was in the hands of the great families (*gentes*), from whose members the senate, amounting to 300, was chosen. This senate appointed, as it were, a more select council of 30, and sometimes a still smaller one of only 10, at the head of whom were two *suffetes* (probably the same as the Hebrew *shofetim*, 'judges'), but it is not certain what relation these bore to one another, or how their power was apportioned between them. We can gather dimly, from various scattered statements, that the Carthaginian oligarchy, while despising the multitude, was itself split up into factions, and torn by family jealousies. Corruption largely prevailed; and it would perhaps have been better for the country if the power had been in the hands of a popular despot than of a band of insolent and tyrannical nobles.

The Carthaginian army was raised from the conscription of the subjugated Libyans, from the hired Numidians, and from slaves. In the time of Agathocles, the city sent forth 40,000 heavy armed infantry, 1000 cavalry, and 2000 war-chariots, but the state could easily raise 100,000 troops. The fleet in the First Punic war consisted of 350 ships, carrying 150,000 men. How C. contrived to raise revenues sufficient to cover the enormous expense her military and naval organisation involved, is not very clear. It was, in all likelihood, derived from tribute imposed on subject Libyan or Numidian races, in great part from mines in Spain, and from import duties derived from her maritime and inland trade, which was prodigiously great. Her merchantmen visited every coast and island of the Mediterranean, and even ventured as far as the Azores, Britain, the Baltic, &c.; while her caravans penetrated through Sahara to the gold-producing districts of the Niger, and through the Libyan Desert to the lands along the Nile.

The religion of the Carthaginians appears to have been substantially the same as that of the Phoenicians—a worship of the stars and of fire. Moloch was the chief deity, and to him children and captives were sacrificed. The highest natural manifestation of this deity was the Sun. Besides Moloch, the Carthaginians worshipped the Tyrian Hercules; Astarte, the goddess of the elements;

Esmun, the god of the celestial vault; and a variety of heroes, heroines, and genii or spirits, such as the Genius of Death, Hamilcar (who fell at the battle of Himera), Dido, the brothers Philemi, &c., as well as a few of the lesser Greek divinities, of whom a knowledge had been obtained in Sicily. It does not appear that there was a distinct sacerdotal order in Carthage. Probably religious ceremonies were performed by the dignitaries of the state, but our knowledge on this interesting point is too meagre to permit of our arriving at any very definite conclusion.

CARTHAGE, CAPE, a headland of North Africa, jutting out into the Mediterranean, in lat.  $36^{\circ} 52' N.$ , long.  $10^{\circ} 22' E.$  Traces of the ancient city of Carthage (q. v.) are found on it to the north of the Tunis lagoon.

CARTHAGENA, capital of the province of the same name in New Granada. It stands on the Caribbean Sea, a little to the south-west of the mouth of the Magdalena, in lat.  $10^{\circ} 28' N.$ , and long.  $77^{\circ} 54' W.$ , having the best harbour on the coast, with a naval arsenal and strong fortifications. Its population is estimated at 10,000, not more than one-tenth being white. The temperature ranges from  $80^{\circ}$  to  $86^{\circ} F.$ —the air, however, being dry and healthy. In the history of Spanish America, and more especially in that of the war of independence, the city occupies a prominent place.

CARTHAGENA BARK. See CINCHONA.

CARTA'GO, a term of various application in Central America.—1. An almost landlocked bay or lagoon of the Caribbean Sea near the north-west extremity of the Mosquito shore.—2. A river entering the same from the south-south-west, about lat.  $15^{\circ} N.$ , and long.  $84^{\circ} W.$ .—3. A river of Costa Rica, flowing into the Gulf of Nicoya, an inlet of the Pacific, near lat.  $9^{\circ} 30' N.$ , and long.  $84^{\circ} 30' W.$ .—4. A city, or rather the ruins of one, on the same, about 60 miles from its mouth. Down to 1841, it was the capital of Costa Rica; but being in that year all but destroyed by an earthquake, it was supplanted by San José, previously its superior in wealth and importance, about 15 miles to the west-north-west of itself. The volcano of its own name, doubtless connected with its overthrow, is valuable as a landmark to mariners.

CARTHAMINE, or CARTHAMEINE. The dye so called is obtained by a chemical process from safflower (q. v.), (*Carthamus tinctorius*), in crystals which are insoluble in water, but slightly soluble in alcohol and ether. When newly precipitated, C. immediately and permanently attaches itself to cotton or silk, but not to wool, requiring no mordant, dyeing the fabric a fine red, which is changed to yellow on the addition of alkalies, and may be returned to red again on being treated with acids.

CARTHU'SIANS, a monastic order which owes its origin to St Bruno, who retired in 1086 with six companions to the solitude of La Chartreuse (whence the name), near Grenoble, where they built hermitages, wore rude garments, and lived upon vegetables and coarse bread. In 1134, the fifth prior, Guigo, composed a body of rules, called the *Statuta Gusgonia* or *Consuetudines Cartusia*, but they have been often changed. After 1170, when the order received papal approbation, it extended rapidly. It dates from 1180 in England, where the name of Chartreuse-houses was corrupted into charter-houses. The C. were divided into two classes, fathers (*pères*) and brothers (*conversi*). Each occupied a separate cell, with a bed of straw, a pillow, a woollen coverlet, and the means of manual labour or of writing. They left their cell, even for meals, only on festivals

and on days of the funeral of a brother of the order. Thrice a week, they fasted on bread, water, and salt, and there were several lengthened fasts in the year. Flesh was forbidden at all times, and wine, unless mixed with water. Unbroken silence, except on rare occasions, was enforced, as well as frequent prayer and night-watching. These austerities were continued, with little modification, by the modern C. The order at one time counted 16 provinces, and can still boast some of the most magnificent convents in the world—as *La Grande Chartreuse*, near Grenoble, and *Ceròsa*, near Pavia. They were given to hospitality and works of charity, and were on the whole better educated than the mendicant orders. Their principal seats were in Italy, France, and Switzerland; but they have shared the fate of the other monastic establishments, and their convents are now for the most part solitudes indeed.—The Carthusian nuns arose at Salette, on the Rhone, in France, about 1229. They followed the rules of the Carthusian monks, but with some mitigations, of which the most notable is that they have a common refectory.

CARTILAGE is a firm elastic substance, of a pearly whiteness, presenting to the unaided eye a uniform and homogeneous appearance. Cartilages may be divided into the *temporary*, the *permanent*, and the *accidental*. The *temporary* cartilages are substitutes for bone in the earlier periods of life, and after a certain time become ossified. See OSTEOLOGY. At birth the extremities and larger eminences of the long bones, and the margins of the flat bones are still cartilaginous, and this C. does not altogether disappear till the period of puberty. The *permanent* cartilages are either *articular* or *non-articular*. *Articular* cartilages are attached to the extremities of bones, and enter into the formations of joints. *Non-articular* cartilages are usually more flexible than the articular. They are sometimes attached to bones, to lengthen them out, as, for instance, in the nose, the auditory canal, and the Eustachian tube. See HEARING, ORGANS OF. In other cases they form the basis of distinct organs, as the larynx, the trachea, and the eyelids. *Accidental* cartilages are cartilaginous concretions, which are occasionally found in situations where they do not normally occur, and are of no general interest. The physical properties of cartilages, especially their elasticity, resisting power, and incapability of extension, are such as to fit them admirably for the functions which they have to perform in the animal economy. A brief notice of the microscopical characters of C. will be found in the article CELLS, and a reference to its chemical composition will be found in the articles CHONDRIN and GLUTEN.

CARTILA'GINOUS FISHES are those fishes which have a skeleton destitute of bony fibres. In some of these fishes, the skeleton is merely rudimentary, so that they seem to form an intermediate link between vertebrate and invertebrate animals. In the lancelets (q. v.) (*Amphioxus*) it consists of nothing more than a slender, transparent, flexible dorsal column; in *Muraena* also it is a soft flexible tube, without appearance of vertebrae or of ribs; in the lampreys, the dorsal column is still a mere cylinder of cartilage, without any notable division into segments; whilst even in the sturgeon, the centre of the backbone is a continuous gelatinous cord, and in the sharks the vertebrae are formed of hollow cones, meeting at their apices in the middle, and having their cups filled with the remains of the gelatinous cord, an arrangement from which result great elasticity and flexibility. In many instances, even in the higher C. F., several vertebrae are united

CARTILAGINOUS FISHES—CARTOON.

in a single piece; in all of them the skull is formed of a single piece without sutures, although the general form agrees with that of the skull of other fishes, and the same parts or regions may be recognised. The calcareous matter present in the skeleton is always deposited in a granular manner, giving a characteristic dotted appearance; but even in the skull of the Basking Shark, one of the most highly organized, the earthy matter has been found to form little more than 3 per cent. of the whole substance; in the skeleton of the lamprey, it is only 14 per cent. In other parts of their organisation, C. F. differ from each other very widely; some of them possessing the organs of the senses in as great perfection as any fishes whatever, whilst in others these organs are very imperfectly developed. Linnaeus placed the C. F. along with Batrachian reptiles in his class *Amphibia*. By the general consent of naturalists, however, they are placed in the class of Fishes. Cuvier, referring to the very different degrees of organisation which they exhibit, says 'they form a series ranging parallel to the bony fishes, just as the marsupial mammals range parallel with the other ordinary mammalia.' Owen and others, admitting the justice of this view, have, however, pointed out in the C. F. generally, characters corresponding with those of the ossaceous fishes in their embryotic state, and with the permanent or mature conditions which prevailed among the fishes of some of the older geological periods. One remarkable characteristic even of the higher groups of C. F.—sturgeons, sharks, rays, &c.—is the heterocercal tail, the vertebral column being prolonged into the upper portion of the caudal fin, and the lower one given off on its under side, as in the fossil fishes generally of the Old Red Sandstone and other oldest fish-producing rocks.—Cuvier divided C. F., or *Chondropterygii* (Gr. cartilage-finned), into three orders: *Sturiones* (Sturgeon, Chimera, &c.), having the gills free, and gill-openings with a lid, like the ossaceous fishes; *Selachii* (Sharks and Rays), having the gills fixed, and consisting of folds of membrane on a plane surface, with numerous gill-openings, the jaws movable as in other fishes generally; and *Cyclostomi* (Lampreys, &c.), also having fixed gills and numerous gill-openings, the mouth adapted for sucking. Müller and Owen, however, separate the *Cyclostomi* of Cuvier from the other C. F., on account of important anatomical differences, particularly in the structure of the heart, which in the *Cyclostomi* wants the *bulbus arteriosus*, or thick muscular swelling of the commencement of the arterial system close to the ventricle; whilst this, which may, in fact, be considered as a third chamber of the heart, is present in the *Sturiones* and *Selachii*, and within it are three or more longitudinal rows of valves; characters derived from the vascular system being deemed by these great naturalists of the highest value in determining the arrangement of the class of fishes. The lancelets occupy a place by themselves, from their absolutely wanting a heart, and having the circulation carried on by the muscularity of the entire vascular system.

CARTOO'N (Ital. *cartone*, pasteboard; from Lat. *charta*, paper). In the fine arts, C. is a design on strong paper, of the full size of a work to be afterwards executed either in fresco, oil colour, or tapestry. The object of the artist in preparing a C. is, that he may adjust the drawing and composition of his subject in circumstances in which alterations can be effected with facility, before proceeding to the execution of the work itself. Cartoons are generally composed of a number of sheets of stout paper or pasteboard, pasted together at the edges, and stretched on a frame. The surface is sometimes primed, or washed with a ground-colour; but more frequently this process is dispensed with. The

drawing is made either in chalks or in distemper (q. v.), in which latter case the C. itself has very much the appearance of a fresco. Frequently only two colours are used, merely for the purpose of producing light and shade, in which case the C. is said to be in *chiaro oscuro*. The C., when finished, is transferred to the canvas or plaster on which the work is to be executed, either by tracing with a hard point, or by pricking with pins, charcoal in both cases being used. Sometimes lines are simply drawn across it, or, if it is wished to preserve it from injury, threads are stretched across it from pins placed at the required distances along the edges. In *fresco* painting (q. v.), the plaster on which the work is executed must be kept wet, in order that it may absorb the colour, and consequently only a small portion can be executed at a time. For this reason, the C. must be traced in small compartments of the size that the artist can finish without stopping. It is here, consequently, above all, that the necessity for the previous execution of a C. is greatest, as it would be impossible to sketch the whole design on the plaster in the first instance. But the great masters used such studies in *chiaro oscuro* as guides to them in almost all their more extensive works, and many of these monuments of their care, as well as of their genius, have been preserved. We have cartoons of Andrea Mantegna, Domenichino, the Caracci, &c.; but the finest specimens of cartoons in existence are those of Raphael at Hampton Court. These marvellous conceptions were sent to Flanders in the reign of Leo X., in order that they might be copied in tapestry in two sets, one of which was designed for the pope, the other for a present by the pope to Henry VIII. of England. The tapestries, which are very inferior to the designs, are still in existence. One set is in Rome, the other was in England till the death of Charles I., when it was purchased by the Spanish ambassador, and carried to Spain. At a recent period it was brought to London and offered for sale, but as no English purchaser was found, it was again carried to the continent. For many years the cartoons, originally twenty-five in number, lay neglected at Brussels, and many of them were destroyed. The seven now at Hampton Court were at length purchased by Rubens for King Charles I. It is an instance of Cromwell's good sense, in a direction in which it was not often exhibited, that at the dispersion of the royal collections, these cartoons were purchased for the nation by his special command. So low was the artistical taste of the time, however, that whilst the 'Triumph of Julius Caesar,' by Andrea Mantegna, still at Hampton Court, was valued at £2000, the cartoons of Raphael were set down at £300! In Charles II.'s time, these remarkable works were again consigned to oblivion. An attempt was made to have them copied in tapestry, by which they were seriously injured. William III., strangely enough, followed in Cromwell's footsteps in appreciating what Charles II. had neglected. He had the cartoons restored, and built a gallery for them at Hampton Court, where, with the exception of a visit to Windsor in George III.'s time, they have since sojourned. The following are the subjects represented: 1. Paul Preaching at Athens; 2. The Death of Ananias; 3. Elymas, the Sorcerer, struck with Blindness; 4. Christ Delivering the Keys to Peter; 5. The Sacrifice at Lystra; 6. The Apostles Healing the Sick at the 'Beautiful Gate' of the Temple; 7. The Miraculous Draught of Fishes. Our space and our design equally preclude us from attempting any statement of the merits of these exquisite compositions. Several of the lost cartoons are partially transmitted to us by engravings, some of which were executed from the tapestries; others, it is believed,

## CARTOUCH—CARTWRIGHT.

from the originals. The subjects of these are—1. The Adoration of the Kings; 2. Christ appearing to Mary Magdalene; 3. The Disciples at Emmaus; 4. The Murder of the Innocents; 5. The Ascension. These were engraved, along with the others, by Somereau, a French engraver, in 4to. Other cartoons of Raphael exist—one the property of the Duke of Buccleuch, and two in the possession of the king of Italy, which are said to have belonged to the set sent to Flanders. There is also a portion of one in the National Gallery in London, but it is now painted over with oil colour. The best engravings of the cartoons at Hampton Court are by Dorigny, Audran, and Holloway; but in future it is probable that they will be more known to the public by means of photographs, of which Messrs Colnaghi and others have already produced very beautiful specimens.

**CARTOU'CH** is a word much used in the French military service, but less frequently in the English. The name was once given to a wooden case containing 200 to 300 musket-bullets, and 8 or 10 1-lb balls, fired from a mortar or howitzer in defence of a ditch or intrenchment; but such missiles have been superseded by others. The cartridge-box carried by the soldiers used to be called a C. in England, and still is in France.

**CARTOUCHE**, the name by which the French, and we after them, designate the ovals on which the hieroglyphic characters for the names of Egyptian kings are sculptured. See **CAVO-RILIEVO**. C. is also used to signify a tablet, either for ornament or to receive an inscription, so formed as to resemble a sheet of paper or parchment, with the edges and ends rolled up. Cartouches are often seen on tombs. The same term is sometimes applied to modillions, or brackets supporting a cornice.

**CA'RTRIDGE** is a cylindrical case made to contain either the whole or a part of the materials for discharging from a firearm. Those for ordnance or large guns are chiefly made of serge and flannel, sewn up into the form of a bag, which, supplied with a given weight of powder, is tied round the neck, and strengthened by iron hoops. The weight of powder varies from about 150 lbs. for a 35-ton gun, to a few ounces for a mountain gun.

Cartridges for small-arms which load at the muzzle are usually paper tubes, containing a leaden ball and a few drachms of powder. The tubes are made in such a way that the powder has two or three thicknesses of paper around it, while at the mouth of the tube and over the bullet there is only one. The paper over the bullet is lubricated generally with a composition of beeswax and tallow. In loading, the paper at the mouth of the tube has to be twisted or bitten off; the powder is then poured into the barrel, the tube reversed, and the bullet inserted into the muzzle, and the tube broken away. Cartridges for breech-loading small-arms are generally formed of a thin sheet of brass coiled into a cylinder, and having an iron case, in the centre of which is the percussion arrangement. Those used for the Snider (our present military arm) and the Martini-Henry rifles are described in the article on **BREECH-LOADING ARMS** (see **SUPP.**). Besides the C. case of coiled brass, there are others made of solid brass or copper (an American invention), and these seem to be gaining favour abroad, the Prussians having adopted such a case for the new Mauser rifle.

For muzzle-loading shot guns, the chief cartridges used contain a charge of shot packed in a paper cylinder of a size suitable for the bore of the gun. Some of these, in addition to the paper covering, are surrounded with a wire net-work, for the purpose of increasing the range and penetration.

The C. for breech-loading shot guns is usually a stout cylinder of paper with a metal case. They are made of various sizes to suit the different calibres of guns, and with pin or central fire ignition. In the pin-fire C., a small brass pin passes through the side of the case into the percussion cap, and protrudes through a small hole in the top of the barrels. The pin is struck by the hammer of the gun, and forced

Fig. 1.

into the percussion cap, which explodes, and ignites the powder. In the central-fire C., the cap is in the centre of the case, and is exploded by the hammer of the gun acting on a piston contained in the false breech. Fig. 1 is a longitudinal section of a central-fire C., full size.

In America, a solid brass C. case is often used for shot guns.

For sporting rifles, the cartridges are quite as numerous and as varied as for shot guns. With large-bore rifles the same C. case is generally used as for shot guns, but loaded with powder and ball (spherical, solid conical, hollow conical, or shell). For small-bore, or what are known as Express rifles, either a coiled brass C. case, similar in construction to that for the Snider or Martini-Henry rifle, but made to contain a larger charge, or a solid brass case is used. The coiled case can be reloaded twice or thrice, while the solid case can be reloaded as often as twenty times, and on this account the latter is rapidly gaining favour with sportsmen in India and Africa. The express C. contains a very heavy charge of powder, with a light hollow conical bullet giving very great velocity, low trajectory, and immense killing power. Fig. 2 is a longitudinal section of a .450 gauge Henry express C. (full size), the charge of powder in which is 4 drachms, while the bullet weighs only 270 grs.

Cartridges for breech-loading pistols and revolvers are generally small metal cylinders containing a charge of powder and a bullet, and with rim, pin, or central fire ignition, the diameter varying from .230 of an inch upwards.

**CARTRIDGE-PAPER**, a light-coloured strong paper, originally manufactured for soldiers' cartridges (q. v.), is extensively used in art, its rough surface being useful for certain kinds of drawing.

**CARTWRIGHT, EDMUND**, celebrated on account of his invention of the power-loom, was born April 24, 1743, at Marnham, Nottinghamshire. Educated at Oxford, he obtained a living in the English Church, and devoted himself exclusively to his ministerial duties and to literature, until a casual conversation, in 1784, directed his attention to machinery, and in 1785 he exhibited his first Power-loom (q. v.) in

Fig. 2

## CARTWRIGHT—CARYATIDES.

action, an ingenious though very rude machine; upon which, however, he subsequently effected improvements rendering it almost perfect. Its introduction was vehemently opposed, and a mill fitted up with 500 of his looms was ignorantly and maliciously burned down. C., in 1790, took out a patent for combing wool, and secured patents for various other improvements in connection with manufacture. But his patents yielded him little return, and in 1809, government, in consideration of his inventions, granted him £10,000. C. was the author of a legendary poem, entitled *Arminia and Alvira*, and other poetical pieces. He died October 1823.

**CARTWRIGHT, THOMAS**, a distinguished Puritan divine of the 16th c., was born in Hertfordshire about 1535. He studied at Cambridge, where, in 1570, he was chosen Margaret Divinity professor. His lectures here were too honestly critical of the polity of the church to be acceptable to the chief authorities, who deprived him of his professorship, and subsequently of his fellowship. C. travelled on the continent, and made the friendship of such men as Beza, who, in a letter concerning him, says, 'I think the sun doth not see a more learned man.' On his return to England, he again became embroiled with the church and the government, and for his nonconformity suffered imprisonment several times. He died December 1603. He wrote *A Confutation of the Rheinish Translation, Glosses, and Annotations on the New Testament*.

**CARUS, KARL GUST.**, a German scholar, physiologist, physician, and artist, was born at Leipsic, 3d January 1789. He first attracted notice by a series of lectures on comparative anatomy, delivered in his native city about the year 1812. After having superintended, during the war of 1813, the French hospital at Pfaffendorf, he went to Dresden, where he was appointed professor of midwifery in the newly organised medico-chirurgical academy; but resigned his office when elected court-physician and councillor of state. His house was the rendezvous of all the most distinguished savans and artists in Dresden. C. wrote a vast variety of works, some of which are marked by original and striking views, as, for instance, *Ueber den Kreislauf des Blutes der Insecten*, in which he demonstrates the circulation of the blood in insects. He died in July 1869.

**CA'REL-BUILT.** The difference between the *carvel* and the *dincher* methods of arranging the outer planks in ship and boat building is explained under CLINCHER-BUILT.

**CARVING**, a subordinate branch of sculpture, is usually performed on ivory or wood. Ivory was the favourite material for this purpose in the east from an early period. Among the Babylonians, who likewise practised gem-engraving to a great extent, carved heads for staves were executed in vast quantities, as every Babylonian carried a staff and a signet-ring. During the palmy days of Grecian art, ivory was largely employed; the nude portion of the colossal statues of the gods being composed of some solid material overlaid with plates of ivory, while the remaining portions were of plate gold. At a later period, ivory was chiefly employed in small works, usually of a decorative character. During the earliest period, statues of the gods were generally of wood, painted, gilt, or draped with coloured robes, different kinds of wood being appropriated to different divinities. Carvings in ivory form an important branch of early Christian sculpture. Among the most curious of these are the ivory tablets adorned on the outside with low-reliefs, and in the inside coated with wax for the purpose of writing upon. The chair inlaid with ivory that belonged to Archbishop Maximilian in the cathedral

624

at Ravenna, is of this period (546–555). In the year 803, Charlemagne received two richly carved doors as a present from Constantinople, but works of the same kind were executed at a much earlier period. Towards the end of the middle ages, the art of carving in wood was brought to a high degree of perfection in Germany. Altars were adorned with carvings of this material, often of large size, and with numerous figures; in general, the nude portions were carefully and tastefully coloured after nature, and the draperies gilt. Specimens are to be seen in the churches at Altenberg, Erfurt, Prague, and in some churches in Pomerania. The finest and most perfect specimens are a series of reliefs relating to the doctrine of transubstantiation in the church at Tribsees. Many of the Belgian churches also possess very beautiful examples of wood-carving. Michael Wohlgemuth of Nuremberg, and after him Veit Stoss, were eminent carvers in wood. The wood-carving on the great altar of the cathedral at Schleswig by Hans Bruegmann belongs to the beginning of the 16th century. Many graceful specimens of wood-carving, on a smaller scale, belonging to this period, are to be seen in museums. Nuremberg was celebrated for its wood-carvings; but only a few of the many works ascribed to him can be assigned with certainty to Albert Dürer. Portrait medallions, usually cut in box, were much in vogue during the early part of the 16th century. The first artist in this line was Hans Schwartz of Augsburg. During the 17th and 18th centuries, we find ivory again extensively employed in crucifixes, crosses, and goblets, with relief representations. The most eminent artist is Franz de Quenay.

**CARY, REV. HENRY FRANCIS**, known for his admirable translation of Dante, was born at Birmingham in 1772. At Oxford, where he entered Christ Church as a commoner in 1790, he was early distinguished as a classical scholar, and also for his knowledge of Italian, French, and English literature. In 1805 he translated Dante's *Inferno*, and in 1814 the whole of the *Divina Commedia*, a translation remarkable not only for its accuracy but for its expressiveness and force. He afterwards translated Pindar's *Odes* and Aristophanes's *Birds*, and wrote a series of memoirs, in continuation of Dr Johnson's *Lives of the Poets*. For some years he held the appointment of assistant-librarian in the British Museum, and died in 1844. A memoir by his son was published in 1847.

**CARY, SIR ROBERT**, son of Henry Cary, Lord Hunson, was born in 1559 or 1560, and rose to eminence in the civil service of Queen Elizabeth. For a number of years, he acted as English warden on the marches. As a courtier, he was present at the death of Elizabeth, 1603, and expeditiously rode on horseback to Edinburgh to communicate the intelligence to her successor, James VI. At the coronation of Charles I., he was elevated to the peerage as Earl of Monmouth. At his death without male issue the earldom became extinct. Sir Robert Cary wrote his *Memoirs* (Edin. 1808), a work interesting chiefly from notices connected with Border history.

**CARYA.** See HICKORY.

**CARYATIDES** (pl. of *Caryatæ*, literally, a woman of Caryæ), a name given to female figures, in Greek architecture, when applied instead of columns to support a roof. The traditional account of the origin of the name is, that the inhabitants of Caryæ, a city in Arcadia, having joined the Persians after the battle of Thermopylae, the Greeks, after their victory over the Persians, destroyed the town, slew the men, and carried the women into captivity. As male figures representing Persians were used

## CARYOCAR—CASANOVA.

for this purpose, it occurred to Praxiteles, and other Athenian artists, that female Caryate, in their national costume, might be thus employed to commemorate the disgrace of their country. Lessing, and various other writers, have treated this account as fabulous; but it seems to be confirmed by a bas-relief preserved at Naples, in which two female figures are represented in the attitude of C., and which has a Greek inscription mentioning the conquest of Carye. Male figures used for the same purpose are called Atlantes (q. v.).

**Caryatis :**  
From ruins in the Villa Strozi, on the Appian Road—height, 7 feet 10 inches.

combined nuts. The fleshy part of the drupe consists of a butter-like substance, which melts between the fingers, and is used in cookery instead of butter, on which account these trees are sometimes called *butter-trees*. It forms merely a thin covering for the nuts, the bristles on the outer surface of which, in some of the species, sting like the hairs of the nettle, and are very troublesome to those who open them. The kernels are remarkably soft. An oil is extracted from them which is scarcely inferior to olive oil. *C. nuciferum* is now cultivated in the island of Saint Vincent; but *C. butyrosorum*, *C. glabrum*, *C. tomentosum*, and other species appear equally worthy of attention.

**CARYOPHYLLACEÆ**, a natural order of exogenous plants, containing upwards of 1000 known species, mostly herbaceous plants, a few half shrubby. The stems are tumid at the articulations; the leaves always opposite and entire, often uniting around the stem. The flowers are regular; the calyx persistent, of 4—5 sepals, either free or united into a tube; the corolla of 4—5 petals, which are frequently bifid, and generally terminata in a claw at the base, sometimes wanting; the stamens as many, or twice as many, as the petals; the ovary of 2—5 carpels; the stigmas sessile; the fruit is a one-celled capsule, with central placenta, to which the seeds are attached.—The plants of this order are mostly natives of temperate and cold countries; some of them are only found on tropical mountains, near the limits of perpetual snow. Most of them are inconspicuous weeds; some produce beautiful flowers; almost all are insipid and inert; a few contain saponine, and afford a substitute for soap. See SOAPWORT. To this order belong the Pink, Carnation, Sweet William, Lychnis, Chickweed, Cockle, Spurry, &c.

**CARYOPSIS**, in Botany, a fruit in which the seed and pericarp are so incorporated as to be inseparable, and even undistinguishable. The grain or fruit of grasses, as Wheat, Barley, Rye, Maize, &c., is a caryopsis.

**CARYOTA**, a genus of palms, natives of the East Indies, one of which, *C. urens*, remarkable for the acridity of its fruit, which produces a burning

sensation when its pulp is applied to the skin, is also highly valuable for the great quantity of juice (*toddy*) which flows from its wounded spathes, sometimes, in the hot season, to the amount of 100 pints in twenty-four hours from a single tree. Sugar (*jaggery*) is made from this juice by boiling it down, and on this account this palm is sometimes called the Jaggery palm. The pith of old trees, or farinaceous part of the trunk, is also much used for food, and is said to be equal to the best sago. The outer part of the stem is very hard, and applicable to many purposes. The fibres of the leaf-stalks are made into ropes, which are very strong and durable; the leaf-stalks, merely stripped of the leaflets, are used as fishing-rods, being light, tapering, and elastic; and the woolly substance found at their base is sometimes used for calking ships. This palm is found both in India and Ceylon, and abounds chiefly in mountainous districts. It rises to a height of 60 feet, with a trunk of a foot in diameter, and a magnificent spreading head of great double pinnate leaves, and triangular leaflets, the apex of the triangle being their point of attachment.

**CASACALENDA**, a town of Italy, in the province of Molise, 17 miles north-east of Campobasso, on the site of the ancient Calela. Fruits and wine of good quality are produced in the district, where silk-worms are also reared. Pop. 5900.

**CASALÉ**, an Italian city in Piedmont, situated on the right bank of the Po, which is here crossed by an iron bridge, 38 miles east-north-east of Turin. It is a place of considerable antiquity, and occupies the site of a more ancient town. Many Roman remains are found, and coins of the early ages of the republic. It has a cathedral, dating from the 8th c., with valuable archives. The old citadel, founded in 1590, was one of the strongest in Italy, and within recent years the fortifications have been greatly strengthened and extended. During the Italian campaign of 1859, C. was occupied by divisions of the Sardinian army, and for a short time formed the head-quarters of the French emperor. It has manufactures of silk-twist, and a trade in the produce of the district, which is very fertile. Pop. (1872) 27,514. C. formerly gave its name to a province which had an area of about 350 square miles, and a population of about 143,000.

**CASAL-MAGGIORÉ**, a town of Lombardy, Northern Italy, on the left bank of the Po, 22 miles east-south-east of Cremona. Being subject to frequent inundations from the river, strong embankments have been constructed for its protection. It has manufactures of earthenware, leather, glass, &c. Pop. 5000.

**CASAL-PUSTERLE'NGO**, a town of Lombardy, North Italy, 12 miles south-east of Lodi, on the road to Cremona. It has manufactures of silk fabrics, linen, and earthenware, and an extensive trade in Parmesan cheese, which is here manufactured of the best quality. Pop. 5600.

**CASAMA'SSIMA**, a town of Italy, in the province of Bari, 14 miles south-east of the city of that name. It has a convent and two abbeys, and the vicinity produces wine and almonds. Pop. 5600.

**CASANOVA**, FRANCIS, a celebrated painter of battles and landscapes, was born in London, of Venetian parents, 1732. Educated in Italy, he afterwards went to Paris, from which he was driven by the severe criticism of Diderot. C. then took up his abode in Dresden, where he painted chiefly battle-pieces, and by one of his greatest works gained a place in the Academy. He afterwards went to Vienna, and painted for the Empress Catharine her victory over the Turks. He died at

CASANOVA DE SEINGALT, GIOVANNI JACOPO, a notable adventurer of the Cagliostro species, was born, 1725, in Venice, and studied in Padua, afterwards in Venice, intending to enter the church. Having been expelled for sufficient reasons from a seminary of priests, he travelled to Naples, visited Rome, and after many adventures, arrived in Constantinople. On his return to Venice in 1745, he supported himself for a time by his skill as a violinist, until he gained some celebrity by curing a senator who had been attacked by apoplexy. His irregularities again drove him from Venice. He now wandered about for some time among the chief cities in the north of Italy, Milan, Mantua, Verona, Ferrara, Bologna, Parma, &c., but in 1750 he proceeded to Paris, where he was patronised by the nobility, and became acquainted with several eminent authors. It is needless to mention in detail his endless, inexplicable peregrinations. He visited almost every European capital, was somehow introduced to the best company, invariably excited the disgust or ill-will of those who knew him, and had always to 'vanish' after a brief period of enjoyment. In 1761, we find him distinctly professing the miraculous after the Cagliostro fashion: he having undertaken to regenerate old Madame D'Urfé, into a young man—for a consideration! He died in Bohemia in 1803. His celebrated memoirs, *Mémoires écrits par Lui-même* (12 vols., Leipzig 1826—1838), contain many interesting notices of the manners of his times, intermixed with details of his personal adventures.

CASAREEP, or CASSIRIPE, a sauce or condiment made from the juice of the Bitter Cassava or Manioc root. It is in the highest esteem in Guiana, where it is employed to flavour almost every dish; and it is the basis of the favourite West Indian dish called *pepper-pot*. It is a powerful antiseptic, and meat can by means of it be kept for a long time quite fresh, even in a tropical climate. It is made by evaporating and concentrating the juice, which is also mixed with various aromatics. The poisonous principle of the juice is dissipated in the evaporation, so that although the juice in a fresh state is readily fatal to life, the C. is perfectly safe and wholesome. C. is imported into Britain, unimpaired in its qualities.

CASAUBON, ISAAC DE, a great scholar and critic, was born February 8, 1559, at Geneva, where, in 1582, he was appointed professor of the Greek language. Subsequently he held professorships at Montpellier, 1596, and at Paris, 1598, but the death of Henry IV. rendered his position (C. being a Protestant) very insecure, and he therefore gladly accepted the offer of Sir Henry Wotton to visit England. King James received him with distinction, and appointed him sometime after prebendary of Canterbury and Westminster. He died in London, July 1, 1614. His acute investigation and criticism were applied to several branches of archaeology and theology. Among his chief works may be mentioned the able dissertation, *De Satirica Gracorum Poesi et Romanorum Satira* (1605), the treatise *De Libertate Ecclesiastica* (1607), and the *Exercitationes contra Baronium* (1614), a confutation of Cardinal Baronius. His critical and exegetical works include editions of Diogenes Laertius, Aristotle, Theophrastus, Suetonius, Persius, Polybius, Theocritus, Strabo, Dionysius of Halicarnassus, and Athenaeus.

His son, MERRIC CASAUBON, was born at Geneva, 14th August 1599; educated first at Sedan, he accompanied his father to England, and entered Christ Church College, Oxford, where he took his

professor of theology at Oxford. He died at Oxford, July 14, 1671. His attachment to Charles I. deprived him of all his preferments during the Commonwealth, but at the Restoration he received them again. Meric was, like his father, distinguished for his erudition; edited the works of Marcus Aurelius Antoninus, Terence, Epictetus, &c.; and wrote a treatise, *De Enthusiasmo* (Lond. 1655).

CA'SBIN, or KAZVIN, a town of Persia, in the province of Irak-Ajemi, 90 miles west-north-west of Teheran. It is situated on an extensive plain of the same name, and is enclosed by walls. Before the time of Shah Abbas the Great, C. was for a brief period the capital of Persia. The plain affords good pasture, and in the vicinity of the town are extensive vineyards and orchards. The town is very extensive, but a great part of it is now in ruins, owing to its frequent subjection to earthquakes; and the population, which at one time was estimated at 200,000, is now probably not more than a fifth of that number. Some velvets, brocades, and coarse cotton cloth are manufactured; and C. has also a considerable trade in raw silk, rice, &c.

CASCARILLA (i. e., little bark, from Span. *cascara*, bark), the name given in South America to many different kinds of bitter medicinal barks which form articles of commerce. Peruvian bark itself bears no other name in the districts which produce it; and the name C. has recently been introduced in botany for a subdivision of the genus *Cinchona* (q. v.). By European physicians and apothecaries, the name C. Bark (*cortex cascariella*) is given to the bark of the *Croton Eleutheria* (see CRONON), a small tree, a native of the West Indies, where it is known as the *Sweet-wood* and the *Sea-side Balsam*. It is imported in considerable quantities into Europe from the Bahama Islands, and appears in commerce in small thin fragments and in quills. It is sometimes employed as a substitute for cinchona, although inferior in tonic and febrifuge qualities. It is a favourite medicine in Germany.—The barks of a number of other species of *Croton* appear to possess properties similar to those of C. Bark.

CASE, in Grammar. See DECLINATION.

CASE, in legal phraseology, though often used as synonymous with Cause, has, both in the law of England and Scotland, separate though not always very definite meanings. A formal written argument, prepared with a view to obtaining the opinion of a court of law, is called a case. By 15 and 16 Vict. c. 86, s. 61, the practice theretofore prevailing in the Court of Chancery of directing cases for a court of common law, is abolished. In Scotland, cases were formerly resorted to in almost every suit of intricacy and difficulty; but the abuse which arose from this practice has been remedied by 13 and 14 Vict. c. 36, s. 14. The statements which are laid before the House of Lords in appeals from Scotland, are cases in the sense now indicated.—In Scotland and Ireland, as in England, questions in dispute can now be stated for the opinion of courts without the usual formality of pleadings, and decided more quickly.

CASE, in Letter-press Printing, a receptacle for types, generally made 34 inches long, 15 inches broad, and 1½ inch deep, and divided into compartments or 'boxes,' each of which contains types of one class or letter. A pair of cases consists of an upper and a lower case: the upper one has 98 'boxes,' and contains the capitals, small capitals, and some other letters that are only occasionally required in composition; the lower one has 53

'boxes,' and holds the letters of the small character, figures, spaces, and most of the points. The places assigned to the several letters of the alphabet in the boxes of the case are not precisely the same in all printing-offices, but the differences are few. The accompanying illustration shews a prevalent arrangement. When in use, the cases lie on a frame four

Upper Case.

Lower Case.

feet high, and the compositor stands in front of them. The different sizes of the boxes in the lower case depend upon the comparative frequency in which the several letters occur in composition, and the position in the case allotted to each letter is such as to afford the greatest facility in composing. The letter e, which is most run upon in the English language, has a box much larger than any of the other compartments, and is placed directly in front of the compositor. In the upper case, the boxes are of uniform size, and the letters are placed in alphabetical order, the comparatively rare occurrence of capitals rendering it immaterial which letter is nearest the compositor's hand. A case will hold a quantity of 'letter' more than sufficient to 'set up' two pages of this work, which is equal to 15,000 types.

CASE-HARDENING is the process of converting the surface of certain kinds of malleable-iron goods into steel, thereby making them harder, less liable to rust, and capable of taking on a better polish. Fire-irons, portions of fine grate-fronts, gunlocks, and other articles of limited size, are very commonly so treated, but the process is sometimes applied to large objects, such as iron railway-bars. The articles are first formed of bar iron, and being heated to redness, are sprinkled with a little powdered yellow prussiate of potash, and heated again. The result is, that the heat decomposes the prussiate of potash, and the liberated carbon combines with the iron, forming a coating of steel on the surface of the articles. Another mode of C. is to heat the articles along with some animal matter, such as the parings of horns and a little common salt, from one-half to several hours; the articles are then cooled in cold water, or in oil, when they are of a delicate nature. Charcoal alone is also employed. The coating of steel is very thin, seldom exceeding  $\frac{1}{16}$ th of an inch. Where it is wanted to be thicker, the articles are treated several times. A Swedish iron-master has found that a very excellent case-hardening is obtained by treating iron objects with a mixture of animal matter and arsenious acid dissolved in hydrochloric acid, and heating as usual.

CA'SEINE, or CASEUM, is an organic compound allied to albumen (q. v.), found in the milk of the mammalia, and in peas, beans, and other leguminous seeds, when it receives the name of LEGUMIN. The proportion of C. in milk (q. v.) varies, but averages about 3 per cent, and it may be coagulated and separated therefrom by the addition of a little rennet (q. v.), as in the manufacture of cheese (q. v.), or by the employment of a few drops of a mineral acid, such as dilute sulphuric acid. In either case, the C. separates as curd, which still retains attached to it some oil and earthy salts, though the greater portion of these substances, along with the sugar, remain in the watery liquid or whey. The elementary bodies which enter into the composition of C., and the proportion in which these are present in 100 parts are—carbon, 53·83; hydrogen, 7·15; nitrogen, 15·65; oxygen, 22·52; and sulphur, 0·85. The properties of C. are, that it is not coagulated by heat, as is well evidenced in the heating of milk, but is coagulated on the addition of rennet; sulphuric, hydrochloric, or nitric acids; alcohol, creasote, or infusion of galls, but not by acetic acid. It also forms insoluble precipitates with solutions of the poisonous salts, acetate of lead, nitrate of silver, and bichloride of mercury (corrosive sublimate), and hence the efficacy of taking large doses of milk in cases of poisoning by those deadly salts, as the C. in the milk, forming an insoluble compound with the poison, keeps it from exerting its deadly powers.

The form of C. obtained from plants, and termed legumin, is generally procured from leguminous seeds, like peas or beans, though it can also be extracted from the majority of vegetable substances, especially from sweet and bitter almonds, and even from tea and coffee. Dried peas contain a fourth of their weight of legumin, and this can be extracted by bruising the peas to powder, and digesting in warm water for two or three hours. The liquid is then strained through cloth, which retains the insoluble matters, and allows the water with the legumin dissolved therein, and with starch mechanically suspended, to pass through. On settling, the starch falls to the bottom of the vessel, and the clear liquid holding the legumin in solution, on the addition of a small amount of acetic acid, yields a precipitate of legumin or vegetable caseine. So perfectly does the vegetable C. resemble the C. from milk, that the one can hardly be distinguished from the other by chemical tests or by taste; and at the present time there is regularly prepared in various parts of China, especially near Canton, a form of cheese from peas, which is sold to the populace in the streets of Canton under the name of Tagfoo. C. is a most important article of food. See NUTRITION.

CA'SEMATE, originally a loopholed gallery excavated in a bastion, from which the garrison could do execution upon an enemy who had obtained possession of the ditch, without risk of loss to themselves. Hence the designation, from Span. *casas*, house, and *matar*, to kill. As defence from shells became more important, the term was subsequently applied to a bomb-proof vault in a fortress, for the security of the defenders, without direct reference to the annoyance of the enemy. A *casemated* battery consists of such a vault or vaults, with openings for the guns. A C. may also serve for barracks, or for an hospital, or for a store-house. The great want of ventilation in casemates renders them bad places for barracks; and the artillerymen are nearly stifled with smoke when firing from such confined places.

CA'SEMENT (It. *casamento*, a large house), a frame with hinges to open and shut, enclosing part

## CASERNE—CASHEL

of the glazing of a window. Windows of this description are rare in this country, but are almost universal on the continent. Also a name for a deep, hollow, circular moulding, similar to the *cavetto* of classical and the *cavetto* of Italian architecture. The C. is very prevalent in the perpendicular style of Gothic architecture, and is sometimes enriched with running foliage.

**CASERNE** is a barrack or building for the accommodation of the soldiers forming the garrison of a fortified town or post.

**CASERTA**, a town of Italy, in the province of the same name, is situated on a plain about 17 miles N.E. of Naples. It is chiefly remarkable on account of its magnificent palace, one of the finest in Europe, and formerly the frequent residence of the Neapolitan court. During 1860, C. acquired celebrity as the head-quarters of Garibaldi and his army. A royal silk manufactory has been established in the neighbourhood. Population, with adjoining hamlets, about 30,000.

**CA'SE-SHOT**, or **CANISTER-SHOT**, is an assemblage of bullets or small balls, enclosed in a cylindrical case or canister. The diameter of this canister is a little less than the bore of the gun from which it is to be discharged. According to the size of the canister, the balls vary from 1 lb. to  $\frac{1}{4}$  oz. each, from 30 to 280 in number, and from 3½ lbs. to 85 lbs. in total weight. The canister bursts immediately on leaving the gun, and the balls spread out into an irregular sort of cone. Within a range of 500 yards, they work great execution among troops; they are generally used at 200 or 300 yards.

In a more modern and effective kind, called *spherical* case, the bullets are enclosed, along with a charge of powder, in an iron shell, instead of a tin canister. It is often called *shrapnel shell*, from the name of its inventor. A spherical case-shot for a 68-lb. carronade, or for an 8-inch howitzer, contains 337 balls; for a 24-pounder gun, 128; and for an 18-pounder, 90. It is exploded by a fuse, the length of which depends on the distance of the point where the destructive effect is to be wrought. Its effect is something like that of a prolonged musket-fire. The shrapnel shell is not of much use against the hull of a ship; but is very destructive against masses of men on shore, or on the decks of a ship, with a greater range than that of ordinary canister. Artillerymen prefer just such an amount of charge as will burst the sphere, without scattering the balls very widely.

**CASH** (Fr. *caisse*, a chest for containing money) is sometimes used as synonymous with money, as distinguished from produce, in which sense it includes all immediately negotiable paper—bills, drafts, and bonds, as well as coin and bank-notes. At other times, it is used, in a limited sense, to denote coin and bank-notes, as distinguished from negotiable instruments which pass by indorsement.

**CASH ACCOU'NT**, or **CASH CREDIT**, a form of account with a bank, by which a person is entitled to draw out sums as required by way of loan to a stipulated amount. The practice began about 1729 in Scotland, with the banks of which country it is still peculiarly identified; but it is not unknown elsewhere, though on a somewhat different plan. In connection with the Scotch banks, the C. A. system is placed on a distinct and secure basis, which we shall briefly describe. The persons procuring a credit of this kind are for the most part retail-dealers, tradesmen, and farmers, who possess a limited capital, and need occasional loans. Instead of borrowing money by bills or mortgages, they apply to a bank for a C. A. to the extent, it may be, of £500. In the origin of the system, the bank

may be said to have been influenced by three considerations—first, the necessity for making advantageous use of its capital; second, the desire to extend its issues of small notes; and third, the nature of the security offered. Since Sir Robert Peel's act restricting circulation of notes, the second of these reasons no longer operates; for the banks are now much above their authorized issue, and must hold an equal amount of coin against the surplus. What the bank particularly wants, is a customer who will be constantly depositing sums in notes of other banks, and drawing out sums in its own notes. The C. A. system aids this process. It secures a customer who will be frequently operating on his account, according to the exigencies of his business, and whose overdraughts, as well as deposits, tend to benefit the concern. Obviously, for the Debtor, the system works more advantageously than when a fixed sum is borrowed, for in that case interest would run on for the whole amount, whereas by a C. A. the trader merely draws what he requires; and by paying in his surplus money in small sums, he is charged with interest only on the sum actually at his debit from day to day. In negotiating a C. A., a bond is prepared by the bank stating the amount and the nature of the security, the cost of which is borne by the borrower. Banks often, in security, accept heritable property and policies of life insurance, but more commonly two persons in good credit become cautioners, or co-obligants along with the principal. Unless the liability of the cautioners respectively be expressly limited in the bond, each is liable for the whole amount. If the bank liberates one cautioner without the consent of the other, it loses its recourse. This recourse is not lost by accepting a dividend from the sequestered (bankrupt) estate of a principal or cautioner; but it will be lost by accepting a composition from either of these persons without consent of the other. The bank can at any time stop the credit, and call for payment of the balance due. A cautioner can at any time withdraw his name from the credit, on paying up the balance, and the bank is bound to assign the debt to him. While cash accounts may be of great service to traders who act upon them discreetly, it is found that, in too many instances, these accounts are used as a dead-loan to the entire amount stipulated for; and for this, as well as a reason above assigned, banks care now very much less for this kind of business than formerly. Properly, traders are to look on the money procured on cash credits not as an addition to capital, but merely a temporary substitute for current business purposes while the capital is out with customers, and to be replaced accordingly until again required. It may be added, that the progress of commercial wealth in Scotland, now greatly lessens the necessity for having recourse to the C. A. system.

**CA'SHEL**, a town of Ireland, in Tipperary county, and 105 miles south-west of Dublin by rail. It is irregularly built on the south and east slopes of an isolated height, rising abruptly from a rich and extensive plain. Pop. (1871) 4317. C. is a bishop's see, and returns one member to parliament. The ancient kings of Munster resided here. The top of the height, or 'Rock of Cashel,' is occupied by an assemblage of the most interesting ruins in Ireland, which have a grand effect from the country around. The ruins consist of a cathedral, the largest and most remarkable in the country, founded 1169, burned 1495, and afterwards repaired; a stone-roofed chapel, built 1127 by Cormac McCarthy, king of Munster, and the most perfect specimen of the kind in the country; Hore Abbey, founded 1260; the palace of the Munster kings;

and a round tower, 90 feet high and 56 in circumference. The round tower is built of freestone, but the other ruins of limestone. At C., in 1172, the great synod was held in which the Irish prelates first acknowledged the authority of the English king and church.

CASHEW' NUT (*Anacardium occidentale*), a tree of the natural order *Anacardiaceæ*, a native probably of the tropical parts of both hemispheres, although it has been commonly regarded as of American origin. It is a spreading tree of no great height. It abounds in a clammy, milky juice, which turns black on exposure to the air, and is used in India for varnishing, but is so acrid as to produce painful inflammation when it comes in contact with the skin of some persons, or when they are exposed to its fumes. Others are comparatively unsusceptible of its influence. The fruit of this tree is a kidney-shaped nut, about an inch long, seated on the thicker end of a pear-shaped fleshy stalk, from which the botanical character of the genus is derived. The

Cashew Nut (*Anacardium occidentale*).

shell is double, the outer shell being ash-coloured, and very smooth; and between it and the inner is a layer of very caustic black juice. The kernel is oily, and very pleasant and wholesome, and is in common use as an article of food in tropical countries, being made into puddings, roasted, and in various ways prepared for the table. In the West Indies, it is put into wine, particularly old Madeira wine, to which it is thought to communicate a peculiarly agreeable flavour, and for this use it is sometimes imported into Britain. It is also for the same reason sometimes an ingredient in chocolate. Yet the vapour which arises from it in roasting, but which is derived from the coating of the kernel, and not from the kernel itself, is so acrid as to cause erysipelas and other painful affections of the face in those who conduct the process, unless great caution is used.—The fleshy stalk, sometimes called the *Cashew Apple*, varies in size, being sometimes not much larger than a cherry, and sometimes as large as an orange, and is white, yellow, or red. It is perfectly free of the acridity characteristic of the natural order, is acid and eatable, very pleasant and refreshing, and much used by the inhabitants of the countries in which the tree grows. A very pleasant vinous liquor is obtained from it by fermentation; and this by distillation yields a spirituous liquor, highly

esteemed for its flavour. A gum which exudes from the bark of the tree, quite distinct from the milky juice already mentioned, is bland, and very similar to gum-arabic.

CASHGAR, or KASHGAR, the political capital of Eastern Turkistan, of which khanate—Independent of China since 1865—Yarkand is the commercial capital. C. stands 140 miles north-west of Yarkand, in lat.  $39^{\circ} 25' N.$ , long.  $73^{\circ} 57' E.$  It is surrounded by an earthen rampart, pierced with four gates, and is strongly garrisoned. It has manufactures of cotton, gold and silver cloths, carpets, &c.; and an extensive trade with Central Asia. Population variously estimated at from 80,000 to 100,000. C. is said to have been an important commercial town before the Christian era, and was for about a century in the possession of the Chinese. See YARKAND.

CASHIERING is a punishment for officers in the army and navy. It is a severe form of dismissal from the sovereign's service, and implies that the officer, by some disgraceful conduct, has deserved not only dismissal, but disqualification for ever again entering the service. Sometimes there are words added, implying still deeper ignominy and degradation. On some rare occasions, when a court-martial has awarded C., the commander-in-chief has mitigated the punishment to simple dismissal. 'Scandalous and infamous conduct,' and 'Conduct unbefitting the character of an officer and a gentleman,' mark two degrees of offence which may lead, the one to C., the other to dismissal.

CASHMERE, a valley of the Himalaya, between India Proper and Middle Tibet, stretching between lat.  $33^{\circ} 15'$  and  $34^{\circ} 35' N.$ , and long.  $74^{\circ} 10'$  and  $75^{\circ} 40' E.$  Its bottom, a comparative level of about 2000 square miles, is about 5500 feet above the sea; while the enclosure, as a whole, from ridge to ridge, besides fully doubling the area, attains, at some points, nearly thrice the altitude. The mountain-wall of this secluded region presents but few passes, and most of these too lofty to be practicable in winter. In fact, the Baramula itself does not admit a wheeled vehicle. Through this single opening, situated at the south-west, the Jhelum carries down towards the Punjab the gathered streams and lakes of the entire basin, and is navigable for the last 70 miles of its course. This net-work of waters, without swelling into inundations, affords everywhere a perennial supply for the purpose of irrigation. Besides the copious rains of spring, the snows of winter covering even the plains to a depth of two feet for four months, accumulate, in every gorge and on every declivity, reservoir above reservoir, against the demands of summer. C. is traditionally believed to have been a vast upland lake, and alluvial deposits beyond the reach of existing influences would seem to confirm the idea.

In regard to climate, moderate but steady frost prevails from November to March; and again, the heat, ranging from  $75^{\circ} F.$  in June, to  $85^{\circ}$  in August, is often disproportionately oppressive, through the stagnation of the landlocked atmosphere. The staple production is rice, which, from the singular facilities of irrigation, is an all but sure crop, yielding, even in a tolerable season, 30 or 40 returns; and in the abundance and excellence of its fruits, C. is said to surpass all the rest of the world. The valley is, in general, considered to be remarkably healthy. The inhabitants, almost universally held to be models of strength and beauty, amounted, before 1828, to 800,000, or to 400 in a square mile. But by casual famine and pestilence they have since been reduced to 200,000. The people are mostly Mohammedans, divided between the Sunnite and

## CASHMERE GOAT—CASPIAN SEA.

Shiite sects. The manufactures—all superior of their kind—are shawls, leather, firearms, and attar of roses. The principal towns are Serinagur, Lalambad, Shupayon, Pampur, and Baramula. The history goes back, through colossal monuments chiefly of marble, beyond the dawn of authentic annals. In 1315, C. first received Mohammedanism; in 1586, it was annexed to the Mogul empire; in 1752, it fell under the power of the Afghans; and in 1819, it was subjugated by the Sikhs. Lastly, being ceded, at the close of the first war of the Punjab, to the British, it was by them transferred to Gholab Sing, as the nucleus of a state of its own name, which comprised also Jamu, Bulti, Ladakh, Chamba, &c. This new principality, with 25,000 square miles, and 750,000 inhabitants, is said to have a force of about 24,000 men of all arms.

**CASHMERE GOAT**, a variety of the common goat, remarkable for its very long, fine, and silky hair, from which the highly valued Cashmere shawls are made. It is not so much in Cashmere that this variety of goat is to be found, as in Tibet, from which the finest goat-hair is imported into Cashmere, to be there manufactured into shawls. The hair is even longer than that of the Angora goat, and not, like it, curled into ringlets, but straight. It is about eighteen inches long. A single goat

Cashmere Goat.

does not yield more than three ounces, and the fleeces of ten goats are requisite for the manufacture of a shawl a yard and a half square. The hair is spun by women, and dyed after it is spun. It is said that 16,000 looms are kept in constant employment in Cashmere, producing annually about 30,000 shawls. The shawls are woven in rudely constructed looms, a pair of shawls sometimes occupying three or four men a whole year in weaving. C. shawls, of the finest quality, are sold in London at from £100 to £400 each. Plain shawls are simply woven in the loom, but those with variegated patterns are worked with wooden needles, a separate needle being used for each colour. These shawls are in the highest request in India; but the hair of several other breeds of goat inferior to that of Tibet is employed for the manufacture of shawls called by the same name. Imitations of these are manufactured in France rather extensively, some from the Tibet wool entirely, and others of a mixture of this with silk and cotton. Twenty-four pounds of the best Tibetan goat-hair is said to sell in Cashmere for 20 rupees, or £10 sterling.

Attempts have been made to introduce the C. G. into Europe. Baron Alstroemer attempted, in the end of last century, to naturalise it in Sweden; and a very spirited attempt to introduce it into Britain has recently been made by Mr

650

Towers. A mixed race, produced by crossing the C. G. and the Angora goat, has been found to possess most valuable qualities, the hair being long, fine, and more abundant than in any of the parent breeds.—The male of the C. G. has very large, flattened, wavy horns.

**CASIMIR**, properly Kasimierz, was the name of many Polish princes and kings. With the establishment of the power of Casimir I in 1040, the predominance of Christianity was decided in Poland. But the most distinguished of this name was Casimir III., called Casimir the Great, who succeeded his father, Vladislaus Loketek, as king of Poland in 1333. He added Little Russia and Red Russia to his dominions; repelled the Tatars, who then threatened Poland; and waged successful war in Silesia, which he conquered but did not retain. He shewed great anxiety for the advancement of the arts and of learning in his kingdom, and for the improvement of the condition of the most oppressed classes, which won him the title of King of the Peasants. A Jewish mistress obtained from him liberties for the Jews, which they have since retained in Poland. He died in consequence of the falling of his horse in 1370.

**CASI'NO**, an Italian diminutive of *casa*, a house, signifies a place for social reunions. The Italian nobles have long had casinos detached from the palaces in which they live, whither they can retreat and enjoy themselves, and it is probable that the public casinos were the result of an attempt made by the middle classes to imitate their superiors. In Italy, a C. is generally close by a theatre, and is a place where musical or dancing *soirées* are held, containing a conversation-room, billiard-room, and rooms for other kinds of amusement, as well as small apartments where refreshments may be had. Casinos are numerous in Italy and Germany, and have been introduced into England. In general, they are not supposed to exert an edifying influence on the community.

**CASINO**, or **MONTE-CASINO**, a mountain overhanging the town of San-Germano (the ancient Casinum), in the Italian province of Terra di Lavoro, between 50 and 60 miles north-north-west of Naples, is celebrated on account of the monastery founded here by St Benedict (q. v.) in 529 A. D. This monastery is remarkable for its noble architecture, its ancient wealth, its library and archives, and in modern times for the learning of its monks, who have a printing-press, from which several important works have issued. The beautiful situation of the abbey, and the reputation of the monks as masters of the healing art, formerly made Monte-Casino a favourite resort of pilgrims. Luigi Tosti, the librarian of the abbey, has given an account of its literary treasures in his *Storia della Badia di Monte-Casino* (3 vols., Nap. 1841—1843), and in the first volume of a catalogue published in 1874.

**CA'SOLI**, a town of Italy, in the province of Chieti, situated on a hill 17 miles south of the city of Chieti. Pop. between 5000 and 6000.

**CASO'BIA**, a town of Italy, 5 miles north-north-east from Naples. Silk is produced in the district. Pop. 8000.

**CA'SPÉ**, a town of Spain, in the province of Saragossa, 57 miles south-south-east of the city of that name. It is situated near the Ebro, has manufactures of oil and soap, and a trade in the agricultural produce of the district. Pop. 7500.

**CA'SPIAN SEA**, an inland sea or great salt-lake, the largest in the world, on the boundary between Europe and Asia, extending from lat. 36° 40' to 47° 20' N., and long. 46° 50' to 55° 10' E. Its length from north to south is about 700 miles, and its average

breadth about 200 miles. Its total area is estimated at 140,000 square miles. The coast-line is irregular, and on the east side especially there are several bays and indentations of coast, the principal being those of Mervoi, Mangushlak, Kenderlinak, Karabugos, and Balkan. From the west, the naphtha-impregnated peninsula of Apsheron stretches into the C. opposite the Balkan Gulf; Mount Caucasus also rises on its west side. On the south rises the lofty range of the Elburz Mountains, between which, however, and the coast, on this side almost unbroken, extends a low flat plain of from 15 to 20 miles in breadth. On the north, it is bordered by great steppes, and the country eastward is a vast plain. It is probable that at one time its waters, which are said to be still diminishing, covered great part of the adjacent steppes. Some singular changes appear to take place in the level of the Caspian. Various measurements have made its depth and elevation different. One Russian measurement made it 343 feet below the level of the Black Sea, another only 84 feet. The latest estimate makes it only 334 feet below the Black Sea. It has no tides, but its navigation is dangerous because of violent storms, especially from the south-east, by which its waters are sometimes driven for many miles over the adjacent plains. The depth near the southern end is about 600 feet, and in some places near the centre it attains a depth of nearly 3000 feet; but near the coast it is very shallow, seldom reaching a depth of more than 3 feet at 100 yards from the shore, and in many places a depth of 12 feet is not reached within several miles of the beach. On the north-east and east it is especially shallow. It receives the waters of a number of large rivers, of which the greatest is the Volga. The Ural, the Terek, and the Kur also fall into it. The water of the C. S. is salt, but much less so than that of the ocean. Its northern parts are covered with ice during winter. It abounds in fish, and very valuable fisheries are carried on, especially for sturgeon and salmon. By a canal uniting the head-waters of the Volga with the rivers Tverza and Schlina, the C. is united with the Baltic Sea. It belongs in part to Russia, in part to Persia, and in part to the Turkomans. The Russians have some vessels of war upon it, and the most of its commerce is in their hands. Steam-packets have been established on it. The chief Russian town upon its shores is Astrakhan, at the mouth of the Volga. Derbend, Guriev, Baku, and Krasnoi-yar are also Russian towns upon the Caspian Sea. Balfrush, Reashd, and Astrabad are Persian towns. The Turkomans have only a few fishing-villages on the eastern shore.

The C. S. was known to the Greeks and Romans. According to Strabo, it derived its name from the Caspii, a tribe inhabiting its western shores. The name Caspian was afterwards limited to the western portion of the lake—the eastern being designated the Hyrcanian Sea.

**CASQUE.** See HELMET.

**CASS,** LEWIS, an American statesman, born at Exeter, New Hampshire, in 1782. He was educated for the law, but quitting that profession, he entered the army in 1812, and rose rapidly to the rank of general, though his merit was not very conspicuous. In 1813, he was elected governor of Michigan, in which state he settled. During his governorship, he kept himself apart from party politics, yet all his measures had a decidedly democratic tendency. In 1831, C. was made minister at war under General Jackson, and in 1836 he was sent as plenipotentiary to Paris. In

this capacity he made himself popular by his replies, in *Galignani's Messenger*, to the attacks of the English press on the claims of the Union with regard to its north-east boundaries, and by his protest against the measures of Guizot; but the treaty concluded by Daniel Webster with Lord Ashburton was so much opposed to the views maintained by C., that he resigned his post, and in 1843 returned to America, where he was received with marks of popular favour. He now aimed at the presidency, and in 1844 was put in nomination, but was defeated, as he was also in 1848, when he made another effort to obtain the supreme power. In 1857 he was appointed secretary of state. Though active and energetic, he had no claim whatever to anything like comprehensive statesmanship. In regard to slavery, his conduct was ludicrously inconsistent, determined solely, as it would seem, by a view to what would be popular with those whose favour he was seeking to secure at the moment. Latterly, he went wholly along with the slave-holding party, advocating an extension of territory with a view to extend the ramifications of slavery. But he was chiefly remarkable on account of his bitter hostility to Britain, against which he was ever ready to inflame the minds of his countrymen on the slightest and silliest pretext. He is author of the *History, Tradition, Languages, &c. of Indians in the United States*; of *France: its King, Court, and Government*; and other works. He died in June 1866.

**CASSANDER,** king of Macedonia, and son of Antipater, was born about 354 B.C. When young, he is said to have been ill used by Alexander the Great, and to have consequently conceived a mortal hatred to that monarch's family. On the death of his father, he expected to succeed to the regency; but Polysperchon received the honour instead, which so dismaliified him, that he resolved to contest the sovereignty with his opponent. He was completely successful; but while pursuing his career of conquest in the south of Greece, he learned that Olympias, mother of Alexander, was committing havoc in the north, and consequently hurried back to Macedonia. In less than a year, Olympias was taken prisoner, and put to death. Only Roxana, wife of Alexander, and her son Hegus, now stood between him and the throne of Macedon; but he did not find it convenient to 'make away' with these two until several years had passed. Meanwhile, he married Thessalonica, half-sister to Alexander, in whose honour he founded, about 316 B.C., the town which bears her name. In the following year he caused Thebes, which Alexander had destroyed, to be rebuilt. He next became involved in a war with Antigonus, king of Asia, which, with an intervening peace of one year, lasted from 315 to 301 B.C., in the last of which years Antigonus was defeated and slain at the battle of Ipsus. Along with his auxiliaries Seleucus, Ptolemy, and Lymimachus, he seized and shared the dominions of the vanquished. The rest of his life was spent in intrigue and military enterprise. He died 297 or 296 B.C.

**CASSANDRA,** according to Homeric legend, was the fairest daughter of Priam and Hecuba, and the twin-sister of Helenus. The children playing in the court of the temple of the Thymbrean Apollo, not far from Ilium, till it was too late for them to return home, a bed of laurel-twigs was made for them in the temple; and there, in the morning, two snakes were found licking their ears, from which resulted such an acuteness of hearing, that they could hear the voice of the gods. C. afterwards attracted the love of Apollo by her

## CASSANDRA—CASSEL.

beauty, and he taught her the secrets of prophecy; but displeased by her rejection of his suit, laid upon her the curse that her vaticinations should never be believed. Accordingly, she prophesied in vain of the treachery of the Grecian horse and the destruction of Troy. On the capture of the city, she fled to the temple of Minerva, but was torn from the altar by the Locrian Ajax, and ravished in the temple. She afterwards, in the distribution of the prey, fell to the share of Agamemnon, to whom she bore twin sons, but was murdered by Clytemnestra.

**CASSANDRA**, a peninsula in the province of Roumelia, European Turkey, situated between the Gulf of Salonica and Cassandra, in lat.  $40^{\circ}$  N., long.  $23^{\circ} 30'$  E. The ancient name of this headland was *Pallene*. Grain of superior quality is raised here; wool, honey, and wax are produced; and silk-worms are extensively reared. The Gulf of Cassandra (ancient *Toronaicus Sinus*) has a length of 33 miles from south-east to north-west, and a breadth of 10 miles.

**CASSANO**, a town of Italy, in the province of Cosenza, 34 miles north of the town of that name. It is situated in a valley in the midst of the most beautiful scenery, has a cathedral, an old castle built on an imposing mass of rock in the midst of the city; and manufactures of linen, leather, silk, cotton, and macaroni. Pop. 6000.

**CASSANO**, a town of Northern Italy, 17 miles east-north-east of Milan. It is situated on the right bank of the Adda, here crossed by a bridge on the railway to Brescia, and has extensive silk-mills. C. was the scene of two sanguinary battles—one in 1705 between the French under the Duke de Vendôme, and the Imperialists under Prince Eugene, in which the latter were defeated; the other in 1799, when the Russians and Austrians under Suvarow defeated the French under Moreau. Pop. 1200.

**CASSATION, COURT OF.** In the law of France, the act of annulling the decision of a court or judicial tribunal is called *cassation*, from the verb *casser*, to break or annul (*Lst. quater*; Eng. *quash*); and the function of cassation, as regards the judgments of all the other courts, is assigned to a special tribunal called the Court of C., which may thus be regarded, in a certain sense, as the last and highest court of appeal for the whole country. But as everything is excluded beyond the question whether or not the view taken of the law, and of the proper method of administering it by the inferior tribunal, has been the right one, the idea attached to this institution is less that of a court in the ordinary sense, than of a department of government to which the duty of inspecting the administration of justice is assigned. By the 65th article of the constitution of the year VIII., it was enacted that there shall be 'for the whole of France a tribunal of cassation, which shall pronounce on demands for cassation against judgments in the last resort pronounced by the tribunals'; and the following article of the same constitution bears that this supreme tribunal shall pronounce no judgment on the foundation or merits of the cause, but that, in case of its breaking the judgment pronounced, it shall remit to the tribunal appealed from to pronounce another. The title of tribunal was afterwards changed for that of court, by a *senatus consultum* of the year XII.; but substantially the institution has retained its original character, notwithstanding all the changes of government which have occurred in France. The demand for cassation can be made only by the parties to the suit, or by the *procureur-général* of

the Court of C. for the public interest. Criminal as well as civil judgment may be reviewed by the Court of C., the only exceptions being the judgments of justices of the peace and of courts-martial, military and naval. The delay allowed for bringing a civil case before the Court of C. is three months for persons domiciled in France, six months for those in Corsica, a year for American colonists, and two for all persons resident beyond the Cape of Good Hope. In criminal matters, the procedure is greatly more prompt, three full days only being allowed to the person condemned to bring his action of C., and the same space being given to the *procureur-général*. In all criminal and police cases, the Court of C. may pronounce judgment immediately after the expiry of these days, and must do so within a month. The Court of C. is divided into three sections, one of which is devoted to criminal matters. Its staff consists of a president, who has the title of *first* president, and three vice-presidents, who are called presidents; 45 counsellors or ordinary judges; a *procureur-général*, or public prosecutor; 6 substitutes, who have the title of advocates-general; and several inferior officers. The presidents and counsellors are named by the sovereign for life, the other officers being removable at pleasure. No judgment can be pronounced unless 11 judges are present, the decision being determined by the majority. Where the numbers are equally divided, 5 judges are called in; and cases of peculiar difficulty may be judged of by the three sections united. The whole court, when presided over by the minister of justice, possesses also the right of discipline and censure over all judges for grave offences, not specially provided for by the law. When thus constituted, the Court of C. may suspend the judges of the imperial courts from the exercise of their functions, and call them to its bar. The *procureur-général* of the Court of C. likewise possesses a surveillance over the *procureurs-généraux* of the imperial courts.

The members of this august tribunal wear a red gown with a violet *toque*, or cap of velvet; the robes of the presidents and of the *procureur-général* being doubled with white fur.

**CASSAVA**, a West Indian name of the plant also called *MANOO* (q. v.), and of the starch produced from it, which is otherwise called Brazilian arrow-root, and is popularly known in Britain as *TAPIOCA* (q. v.).

**CASSAY**, or **MUNEEPOOR**, a mountainous country in Farther India, to the south-east of Upper Assam, stretching from  $23^{\circ} 49'$  to  $25^{\circ} 41'$  N. lat., and from  $93^{\circ} 5'$  to  $94^{\circ} 32'$  E. long., and containing, with an area of 7584 square miles, a population variously estimated at 30,000 and upwards. It is important to England merely from its being on the Burmese frontier. Accordingly, before the war of 1825 began, it was occupied by the British; and, being permanently ceded at the close of the contest, it was handed over, free from tribute, to the native rajah. The inhabitants are more generally Brahmanists than Buddhists. The productions are tea, rice, tobacco, indigo, cotton, sugar, opium, and mustard; and the manufactures are muslins, silks, and a few iron wares. The chief town is Munneepoor, which sometimes gives name to the principality.

**CASSEL**, the capital of the former electorate of Hesse-Cassel, now a portion of Prussia, pleasantly situated on both sides of the Fulda, here a navigable river, 120 miles by rail, N.E. of Frankfurt-on-the-Main. It contains (1871) 46,375 inhabitants, including military and servants and labourers connected with them. The oldest part of the town consists of a few very narrow, crooked streets, close on the banks of the Fulda; the more modern parts are

on hills, which rise gently from the river. C. is partially walled. In Friedrichs-Platz, the largest square in any German town, stands the Elector's palace, a comparatively mean structure: a little below is the first story of a magnificent palace commenced in 1820, and stopped in the following year by the death of the Elector who projected it. Amongst the other public buildings and institutions, one of the most important is the *Museum Fredericianum*, which has a library of 90,000 volumes and some valuable MSS. The Picture-gallery contains about 1400 paintings, including some excellent specimens of the best masters. In the cabinet of curiosities, there are examples shewing the gradual development and improvement of watchmaking from the earliest invention at Nuremberg to the present time. C. contains an observatory, and is the seat of a number of learned and scientific associations. From 1807 to 1813 it was the capital of the kingdom of Westphalia. The gardens of Wilhelms-höhe—which was assigned by the present Emperor of Germany to the late Emperor Napoleon as a residence after his fall at Sedan, in September 1870—with their splendid fountains and cascades, and the colossal statue of Hercules, within the hollow of whose club eight persons can stand at one time, are only three miles from Cassel. There are manufactures of cotton, woollen, and silk fabrics, lace, and carpets. Under the name of *Chassala*, the town appears to have existed as early as the 10th century.

CASSEL, a town of France, in the department of the Nord, 27 miles north-west of Lille. It is pleasantly situated on a hill, overlooking a country on all sides so flat, that the view, although the elevation is only 800 feet, is said to be one of the widest in Europe, extending over the broad fertile plains of Flanders, and to the chalk cliffs of England, and taking in 32 towns and 100 villages. During the great trigonometrical survey undertaken in the reign of the first Napoleon, Mont Cassel was one of the chief signal-stations. C. has manufactures of lace, linen, thread, hose, &c. Pop. (1872) 3069. It was known to the Romans, who had a station here, as *Castellum*.

CA'SSIA, a name given by the ancients to a kind of medicinal bark, but their descriptions are so imperfect that it is impossible to determine what bark it is. The name is employed in the English translation of the Old Testament in Exodus xxx. 24, and in Psa. xlv. 8, its use in these places being derived from the Septuagint; and it is not improbably supposed that the substance intended is the same now known in our shops as *Cassia Bark*, or *Cassia lignea*.—2. *Cassia* is now the botanical name of a genus of plants of the natural order *Lemnaceæ*, sub-order *Cæsalpineæ*, containing many species—more than two hundred having been described—trees, shrubs, and herbaceous plants, natives of Africa and of the warm parts of Asia and America. They have abruptly pinnate leaves, and flowers with deciduous calyx of five somewhat unequal sepals, corolla of five petals, of which the lower ones are the larger, ten free stamens, of which three are long, four short, and three abortive, and anthers opening by two holes at the top. The leaves and pods of many species have a peculiar sweetish but nauseous smell, and a nauseous bitter taste accompanied with a loathsome sliminess. They seem all to contain the purgative principle called *Cathartine* (q. v.), and the leaves of some of the Asiatic and African species are highly valued, and much used as a medicine, under the name of *SENNA* (q. v.). The leaves of *C. Marylandica* possess similar properties, and are now used to some extent in the United States of

America.—*C. Fistula* (*Cathartocarpus*) yields the C. of the pharmacopœias, the *C. pods*, *Pipe C.*, or *Purging C.* of the shops. It is a large tree, a native of Egypt and other parts of Africa, perhaps also of the East Indies, in which, at all events, it is now widely diffused and cultivated, as well as in the West Indies and warm parts of America. Its leaves have 4—6 pair of ovate smooth leaflets, its flowers are yellow and in loose racemes; its pods, which have obtained for it the name of *Pudding-pipe Tree*, are sometimes two feet in length, cylindrical, black, consisting of thin brittle woody valves, within which is a cavity divided by numerous thin transverse partitions, each cell containing a single seed imbedded in a soft black pulp. It is this pulp that is the part used in medicine; it has a sweetish mucilaginous taste, and in small doses is a mild laxative. It is sometimes removed from the pods when fresh; or an extract is obtained, after they are dried, by boiling and evaporating. It is said to contain 61—69 per cent. of sugar. The C. pods of the West Indies contain much more pulp, and are therefore more valuable than those imported from the East.—3. *C. Bark*, or *C. lignea*, sometimes called *China Cinnamon*, is a bark very similar to cinnamon both in appearance and properties; but in thicker pieces, and less closely quilled, of a less sweet and delicate flavour, but more pungent. It is the produce of the *Cinnamomum Cassia* or *aromaticum*, a tree of the same genus with the Cinnamon-tree, a native of China, and extensively cultivated there. It is highly esteemed by the Chinese, and is now largely imported into Europe. As it contains a greater proportion of essential oil, and is also much cheaper than true cinnamon, it is much more generally used. The oil which it contains is called *Oil of Cassia*, and is very similar to Oil of Cinnamon. Coarse cinnamon is sometimes sold as cassia. *C. Buds* are believed to be the dried flower-buds of the same tree which yields C. bark. They are now imported into Britain in large quantities, and are much used in confectionary. In flavour and other qualities, they resemble C. bark; in appearance, they are very similar to cloves.

CASSIA'NUS, JOANNES, or JOANNES MASSILIENSIS, or JOANNES EREMITA, a Christian teacher of the ancient church, who flourished in the early part of the 5th c., and distinguished himself as the promoter of monachism in Southern Gaul, and as the opponent of the extreme dogmas of St Augustine respecting grace and free-will. Shortly before 415 A.D., he went to Massilia (Marseille), where he founded two monasteries according to the rules laid down in his *De Institutio Cenobiorum*. One of these monasteries was for nuns; the other was the famous Abbey of St Victor, which under C. is said to have possessed not less than 5000 inmates, and which served as a model to a multitude of monastic institutions in Gaul and Spain. His *Collationes Patrum Scetiorum* is a work in 24 chapters, each of which gives a 'spiritual colloquy between monks in the desert of Sketis,' regarding the monastic life, and the vexed questions of theology. C.'s Grecian erudition, his dislike of dogmatic subtleties, and his zeal for monastic habits, led him to oppose the doctrine of St Augustine on works and grace, and to set up a doctrine which was known by the schoolmen as 'semi-pelagianism.' See PELAGIANISM. As C.'s doctrine gained support from the Massilian monks, St Augustine, having been informed of it by his friend Prosper of Aquitaine, wrote strongly against it, especially in his treatise *De Gracia & Libero Arbitrio, contra Collatorem*. It is not known when C. died; but it must have been subsequent to 433 A.D. The first

collected edition of the various works attributed to him was published at Basel, in 1559; the best at Frankfurt, in 1722. The best account of his life and writings is by Wiggers, *De Johanne C.* (Rostock, 1824—1826).

CA'SSICAN (*Cassicus*), a genus of birds allied to starlings, having an exactly conical bill, thick at the base, and extremely sharp pointed, the commissure forming an angulated line, the bill ascending on the forehead, and encroaching circularly on the plumage. They are all American birds of gregarious habits, feeding both on fruits and insects, and exhibiting such surprising skill and ingenuity in the structure of their nests, that an old lady once gravely asked an American ornithologist whether he did not think they might be taught to darn stockings! The Crested C., or Crested Oriole (*O. cristatus*), is a native of Brasil, Guiana, and Paraguay. It is about 20 inches long, is sometimes seen in flocks of 50 or 100, and constructs its nest by knitting together shreds of a thin bark, *Tillandsia*, &c. The nest is about 36 inches long, and resembles a purse or pouch, the lower end hemispherical, and 10 inches wide, and is suspended from the extremity of a branch of a tall smooth-stemmed tree on the outskirts of a forest, apparently to insure safety from monkeys and serpents. Several of these nests are often to be seen hanging from the branches of the same tree.

CASSINI, the name of a family distinguished by their services in astronomy and geography.

CASSINI, GIOVANNI DOMENICO, was born at Perinaldo, near Nice, on the 8th of June 1625, and studied at the College of Jesuits, Genoa. In 1650 he was appointed to the astronomical chair in the university of Bologna. His first work related to the comet of 1652. He subsequently devoted himself to the determination of astronomical refraction, and of the sun's parallax, &c. In 1664—1665 he determined the period of Jupiter's rotation. Subsequently, he determined the periods of the planets Mars and Venus, as also of the apparent rotation of the sun. He it was who discovered the third and fifth satellites of Saturn, and afterwards the first and second, as well as the dual character of that planet's ring. He was also the first who carefully observed the zodiacal light; he demonstrated that the axis of the moon was not (as had been believed) at a right angle to the ecliptic, and explained the cause of the phenomenon known under the name of lunar libration. One of his finest observations was the coincidence of the nodes of the moon's equator and orbit. C. died September 14, 1712, at Paris, whence he had gone in 1669, at the invitation of Colbert, to take charge of the observatory erected by that minister.

CASSINI, JACQUES, son of the preceding, was born at Paris, February 18, 1677. In 1694 he was elected a member of the Academy of Sciences. He travelled in Italy, Holland, and England, where he formed the acquaintance of Newton, Halley, Flamsteed, &c., and was elected a member of the Royal Society of London. On the death of his father, he succeeded to the charge of the observatory at Paris, and died April 16, 1756. C. wrote several treatises on electricity, the barometer, &c. In his treatise, *De la Grandeur & de la Figure de la Terre* (Par. 1720), he attempted to shew that the earth must be a spheroid elongated at the poles. The Newtonians denied this, inasmuch as it was opposed to the ascertained facts of gravitation and rotation, which necessitated the earth's being a spheroid flattened at the poles. As an observer, C. was eminently successful. He determined the periods of rotation of all the satellites of Saturn then known, the inclination of the planetary orbits, the obliquity of

the ecliptic very nearly, and the length of the year, &c.—His son, CESAR CASSINI, was also engaged in scientific pursuits.

CASSINI, JEAN DOMINIQUE, COMTE DE, the son of Cesar Cassini, was born at Paris, June 30, 1748. He succeeded to the charge of the observatory, and completed in 1789 the great topographical map of France, begun by his father. But it having been decreed in 1793 that the observatory should no longer be in the hands of one person, three others were in consequence elected to the superintendence of it along with C., whose conduct on learning this fact shewed that he had a greater regard for his own dignity than for the whole stellar universe. He refused to have anything more to do with astronomical science, and obstinately kept his purpose through a life that lasted nearly a century, and which was apparently so prolonged to test the durability of a Frenchman's disdain. In his 95th year he published a small volume of poems! He died October 18, 1845.

CASSIODORUS, or (according to several MSS.) CASSIODORIUS, MAGNUS AURELIUS, a Latin writer, who distinguished himself by his erudition in an age of barbarism, was born at Scylacum (now Squillace), in Calabria, about 468 A.D. He was a member of a noble Roman family, and soon attracted the attention of Odoacer by his superior abilities and accomplishments. Under this monarch he held various offices, but after the defeat and murder of Odoacer by Theodoric the Ostrogoth, he passed into the service of the latter. The highest honours now fell upon him; and for years he administered the Ostrogothic power with remarkable prudence and success. In his 70th year, however, he withdrew to Calabria, where he founded the monastery of Viviers, and employed himself and the other monks in the invaluable work of copying classical MSS.; his great desire being to improve the education of the clergy. C. was about 100 years old when he died. Besides his grammatical and rhetorical manuals, which were used as text-books during the middle ages, he wrote a very important work, entitled *Variarum Epistolarum Libri XII.* This is a collection of state-papers, and is, in fact, the most extensive as well as the most reliable source of information which we possess in regard to everything connected with the Ostrogothic rule in Italy. The style, however, is very peculiar, and shews the influence which the political career of C. had exercised on his language and modes of thought. The editio princeps of the *Variarum* was printed at Augsburg in 1533.

CASSIOPEIA, the *Lady in her Chair*, a constellation in the northern hemisphere, near Cepheus, and not far from the north pole. It is marked by five stars of the third magnitude, forming a figure like an M. A line from Capella to the bright star in Cygnus passes nearly through the middle of this M. C., according to Flamsteed, contains 55 stars, all of small magnitude. The figure is that of a woman sitting in a chair with a branch in her hand. In the year 1572, there all at once appeared in C. a new star. It was first noticed by Tycho Brahe on the 11th November, when its lustre exceeded that of all the fixed stars, and nearly equalled that of Venus. The star gradually diminished in lustre, from the time of its being observed until, in March 1574, it disappeared. It is said to have alarmed all the astronomers of the age. Tycho Brahe wrote a treatise on it, and supposed that it had previously appeared in 945 and 1204; but this supposition would not appear to be founded on reliable observation. Sir John Herschel suggested the possibility of its reappearance in 1872.

CASSIQUA'RÉ, or CASSIQUIARI, a river of Venezuela, South America, forming the south bifurcation of the Orinoco, which it leaves in lat. 3° 10' N., long. 66° 20' W., and after a rapid southwest course of about 130 miles, joins the Rio Negro in lat. 2° 5' N., long. 67° 40' W. About 100 yards in breadth when it issues from the Orinoco, it gradually increases until at its union with the Rio Negro it attains a width of 600 yards. By means of this singular river, water-communication is established, through the Amazon, Orinoco, and their affluents, between the interior of Brazil and the Caraccas in Venezuela.

CA'SSIS (Fr., the black currant-tree), a French liqueur prepared from black currants; the manufacture has recently become of great importance. See Currant.

CASSITERIDES. See Scilly ISLES.

CA'SSIUS, LONG'NUS CAIUS, one of Caesar's assassins. At the breaking out of the civil war, though a tribune of the plebs, he sided with Pompey and the aristocratic faction against Caesar. He was taken prisoner by the latter, who pardoned him, and even made him one of his legates. In 44 B.C., through the influence of Caesar, he was made *Praetor Peregrinus*, and was promised the governorship of Syria in the following year. But his mean and jealous spirit could not endure the burden of gratitude imposed upon him by the generosity of the dictator, and he resolved to be released by the murder of his benefactor. Having attached to himself the mutinous spirits among the subjugated aristocracy, and also won over M. Brutus, the pseudo-patriotic conspiracy was soon matured, and on the 15th of March, 44 B.C., Caesar fell by the daggers of assassins. The result of this bloody deed was not what C. had expected. The popular feeling—as witnessed by the riots that broke out at Caesar's funeral—was strongly against the murderers; and the military power fell into the hands of Mark Antony. C. therefore fled to the east, and made himself master of Syria. Afterwards he united his forces with those of Brutus, and having greedily plundered Asia Minor, they crossed the Hellespont in the beginning of 42 B.C., marched through Thrace, and took up a superior position near Philippi, in Macedonia. Here they were attacked by Antony and Octavian. The division commanded by C. was totally routed, although, on the other hand, Brutus succeeded in repulsing the troops of Octavian. C., supposing that all was lost, compelled his freedman, Pindarus, to put him to death. C.'s wife, a half-sister of Brutus, survived him upwards of sixty years. She died in the reign of Tiberius, 22 A.D.

CASSIUS, PURPLE OR, is a colouring substance of very ancient use, which is prepared by adding a mixed solution of protochloride and bichloride of tin gradually to a solution of chloride of gold, when a more or less abundant precipitate of the double stannate of gold and tin ( $Au_2SnO_3 + SnO_2$ ) is thrown down. The Purple of C. is soluble in ammonia, yielding a very pretty purple solution, from which it can again be obtained, with solid form unchanged, by evaporating the ammonia. Mixed with borax, or some fusible glass, Purple of C. is employed by the potter to communicate a rich purple or rose tint to the better kinds of china, and it also imparts the red colour to the kind of glass known as Bohemian glass.

CASSIVELAU'NUS, a British chief, who fought against Caesar during his second invasion of the island, 54 B.C. He ruled the country north of the Thames, and had a great reputation as a warrior, but his capital was taken by the Romans, and he himself compelled to flee. He afterwards sued for

peace, which he obtained, on condition of paying tribute and giving hostages.

CA'SSOCK, a long loose coat, formerly in common wear, but now usually worn only by the clergy. As worn by the clergy of the Church of England, it is a long coat with a single upright collar. Black is the common colour for all orders of the clergy, but on state occasions bishops frequently wear purple cassocks. In the Roman Catholic Church, cassocks vary in colour according to the dignity of the wearer—priests wearing black, bishops purple, cardinals scarlet, and the pope white.

CA'SSOWARY (*Casuarius*), a genus of birds nearly allied to the ostrich (see BREVIPENNIES and OSTRICH), but distinctively characterised by still greater shortness of wing, by a laterally compressed bill, by a bony crest, by pendent wattles on the naked neck, and by three toes on each foot, all furnished with claws, the inner toe short, and armed with a very long and sharp claw. There are also very important anatomical differences in its digestive organs, which are not adapted to the same coarse diet, for the C. 'has short intestines and small coeca, wants the intermediate stomach between the crop and gizzard, and its cloaca does not proportionally exceed that of other birds.' Only one species is known, *Casuarius galeatus*, sometimes called Emu by the older naturalists, before that name was appropriated to the Australian bird which now alone receives it. The C. is a native of the Moluccas, New Guinea, and other Asiatic islands, chiefly inhabiting deep forests. In general appearance, it is not unlike the ostrich, but has a much shorter neck. It is the largest known bird except the ostrich, and its height, when erect, is about five feet. It feeds on fruit, eggs, and succulent herbage. When attacked, it defends itself by kicking obliquely backwards with its feet, and by striking with its short wings, the rigid barbless shafts of which, although useless even to aid it in running, are not

Cassowary.

without value as weapons. There are only about five of them in each wing, somewhat resembling the quills of a porcupine; and at the end of the last joint of the wing there is a spur. The colour of the C. is brownish black; the feathers are loosely webbed, and hang down, so that, at a little distance, the bird seems clothed with hair. Those of the rump are 14 inches long, hanging down in place of a tail. The head and upper part of the neck are naked and of a bluish colour, and there are two pendent wattles, partly red and partly blue, on the

front of the neck. On the breast is a callous bare part, on which the bird rests its body on the ground. The bony crest or helmet reaches from the base of the bill to the middle of the crown, and is about three inches high, exhibiting the most intense blue, purple, and scarlet blended together. The C. lays a few eggs, which it leaves to be hatched by the heat of the sun; and which are greenish, and have a much thinner shell than those of the ostrich. Its flesh is black, tough, and juiceless. The C. is not unfrequently to be seen in menageries in Europe, but is becoming more rare in its native regions, in which it is sometimes kept tame.

**CAST**, an impression produced by pouring a ductile substance, such as plaster of Paris, into a mould. This method was employed by the ancients in multiplying not only objects of art, such as the small household statues of the gods, but articles of direct utility. The so-called *Celt*, or chisels of bronze, which, with the moulds for casting them, are found in England, Ireland, and France, testify to the fact, that the art of casting from a mould is one of the earliest acquired by semi-civilised nations. Casts are of incalculable value in familiarising the eyes of those who can never look on the originals with the grand and beautiful forms of antique art. The best to be had in this country are those executed, and sold on application, at the British Museum. Casting, when applied to metals, is called Founding (q. v.).

**CAST, CASTING-LINE.** The casting-line, in Angling, is a gut-line on which the artificial flies are fastened. It is made up of several lengths of gut, knotted together, and usually from two to four yards long. The flies are attached at intervals of about two feet, and the line with its flies is called a *cast*. The term *cast* is also applied to a part of a stream where certain fish may be taken, as a trout-cast, a salmon-cast.

**CAST-IRON, or PIG-IRON.** This is the crudest form of iron, and the method of its production is described under the head IRON. There are two leading kinds of it—namely, white pig-iron and gray pig-iron; the former is also called forge-iron, from the fact of its being chiefly used for conversion into malleable iron and steel; and the latter is often called foundry-iron, on account of its suitability for castings. Of each of these, again, there are many varieties; and much light has of late years been thrown on what constitutes their different qualities, by experiments in the manufacture of steel. White cast-iron, when melted from the argillaceous ores of the coal-measures, is of inferior value to the gray; much of it, indeed, being produced against the will of the iron-master, when the blast-furnace is working badly. But when obtained from pure ores and fuel it is the most valuable kind, because it contains fewer impurities, and has its carbon nearly all in the combined state, in which case it is best suited for the manufacture of wrought-iron and steel. Gray pig-iron contains carbon both in the combined and the uncombined (graphitic) state. In the grayest kind, uncombined carbon greatly prevails, and the fracture of the iron is more distinctly granular or scaly-crystalline than is the case with other varieties. Such cast-iron is usually called No. 1. It is much softer, but fuses at a higher temperature than white pig-iron. It also becomes thinly liquid when melted, and expands slightly just before cooling—properties which render it extremely valuable for castings. As the grayness and graphite-like brightness diminish, the iron is known as No. 2, No. 3, and so on for several numbers, till we come to the close texture and light colour of white pig-iron; No. 2 being but slightly different from No. 1, and No. 5 from white-

iron in quality. No. 3 is intermediate between the extremes. When cast-iron is partly gray and partly white, it is called mottled iron. Cast-iron contains from 2 to 5 per cent. of carbon, the maximum amount in steel being 2; but steel is practically free from silicon, sulphur, and phosphorus, while cast-iron is not.

**CAST-STEEL.** This term, until lately, was confined to steel made by melting Blister-steel (q. v.), obtained by the old cementation process. Through this simple operation of melting it in crucibles, which was invented by an Englishman named Huntsman about the middle of last century, steel was first readily made perfectly homogeneous, and fitted for the production of the finer kinds of tools and cutting instruments. The crucibles are made of fire-clay, mixed with a small proportion of the material of old ones and coke. They are very carefully prepared and annealed, but notwithstanding this, the heat of the furnace is so high that they can only be three times used. Each crucible contains from 30 to 40 lbs. of steel, which is poured, when melted, into cast-iron ingot-moulds previously smoked. The name 'cast-steel,' however, can no longer be confined to steel so made, because Bessemer steel, although produced by a quite different process, is truly a cast-steel. In Sheffield, the finer kinds of cast-steel are now sometimes called 'crucible steel'; but since puddled steel, which, like the Bessemer, cannot be used for fine cutlery, is also cast in crucibles, such a term is not sufficiently distinctive.

**CASTALIA,** a fountain on the slope of Parnassus, a little above Delphi, in Phocis, sacred to Apollo and the Muses. It was the 'holy-water' of the Delphian temple; and all who came to consult the oracle, or visited the place with any religious purpose whatever, were wont to bathe their hair *sore puro Castalia* (in the pure dew of C.), but those who wished to be purified from murder, bathed their whole body. The Roman poets feigned that its waters filled the mind of those who drank of it with poetic inspiration. It was imagined to have some connection with the river Cephissus, and to flow from the subterranean Styx. The fountain, whose waters are still pure and delightful as in the days of classical antiquity, now bears the name of St John, from a small chapel of that name close by.

**CASTANETS,** a musical instrument of percussion in the form of two hollow nut-shells, which are bound together by a band fastened on the thumb, and struck by the fingers to produce a trilling sound in keeping with the rhythm of the music. The *krotalon* of the ancients was somewhat similar. The C. were introduced into Spain by the Moors, where they retain the name of castanulas, from their resemblance to the form of the chestnut. The C. are now much used in the ballet and in the opera.

**CASTAÑOS, DON FRANCISCO XAVIER DE,** Duke of Baylen, a celebrated Spanish general, was born at Madrid in 1756, and studied in Germany the military tactics of Frederick the Great. For some time after his return to Spain, he had no opportunity of acquiring distinction; but when Napoleon I. invaded that country, C. received the command of a division of the Spanish army, and on the 22d of July 1808, compelled 20,000 French, under General Dupont, to surrender at Baylen. It is asserted, however, that the merit of this prodigious success belonged more to Aloys Reding, a Swiss by birth, and the second in command. In November of the same year, C. was in turn defeated by the French at Tudela. The arrival of Wellington necessarily reduced him to a subordinate position, but he took part in the important battles of Albuera, Salamanca, and

## CASTE.

Vittoria. In 1811, he was appointed general of the 4th Spanish *corps d'armée*, and commandant of several provinces. In 1815, he was placed at the head of 80,000 troops, destined to invade France, some of which had already crossed the frontier when the news came of the battle of Waterloo. Although no great favourite with the court politicians, his talents could not be overlooked. In 1825 he was called to the state council, where he became a decided opponent of the Carlist party. He died 24th September 1852, at the advanced age of 96.

**CASTE**, a term applied chiefly to distinct classes or sections of society in India, and, in a modified sense, to social distinctions of an exclusive nature among the nations of the West. When, at the end of the 15th c., the Portuguese began to penetrate to India by the Cape of Good Hope, and to trade with the Deccan or southern portion of the Indian peninsula, they found arbitrary social laws, full of intricate regulations which constantly interfered with their intercourse with the natives, especially in matters involving the subdivision of labour. They found certain pursuits invariably followed by a certain class, and any attempt to induce a man to perform offices not appointed for the class of which he was a member, met with violent opposition, though such offices might, according to European notions, be more honourable than many he was content to fulfil. They observed, also, that these different classes often varied in appearance, the result, in some cases, of their addiction for many generations to the same pursuits; in others, of their having actually arisen from a different stock. Hence they applied to these various divisions of society the term *casta*—a Portuguese and Spanish word, meaning a breed. As applied to these classes of Hindu society, the word has passed into most European languages. From its frequent use in India, it has sometimes been erroneously considered of Hindu origin.\* Of late, it has been spelled *caste*, but by old authors *cast*; and it is even a question, whether the word may not be as genuine English, as *casta* is Spanish.

In the south of India, the Portuguese became acquainted with what is considered the most exaggerated evil of caste. There are found there large numbers of a class called *Pariahs*, or, in other districts of India, *Chandals*. They are probably the relics of some early conquered race, who have been degraded by uninterrupted ages of oppression, as is represented to have been the case with the Helots of Sparta, and people in a similar condition. These Pariahs were always identified with outcasts—i. e., persons who had forfeited the privileges of their original order. No one of any C. would have any communication with them. If one of them even touched a Nayr, or warrior of high C., he might with impunity kill him. Some sorts of food were defiled by even their shadow passing over them; and the name of Pariah or Chandala conveyed to the Hindu the idea of the utmost vileness and disgust. All who violated the institutions of their class were held to sink into this class—a condition which involved the loss of all human respectability and comfort. These regulations were, moreover, referred to religion.

As India was at this time the land of the marvellous, and its inhabitants, though as various as the different nations of Europe, viewed as one homogeneous people, what was only true of one portion of the peninsula, was considered as prevailing everywhere, and as identical with the

divisions of the Indians into seven tribes or castes, mentioned in olden times by Strabo, by Diodorus Siculus, and by Arrian. Nor was it forgotten that the Egyptians, whose early civilisation was as undoubted as that of India, were also divided, according to Herodotus, into seven classes of priests, warriors, herdsmen, swineherds, tradesmen, interpreters, and pilots, to each of which were assigned particular districts.

About the middle of the 16th c., however, Abraham Roger, chaplain of the Dutch factory at Pulicat, gained the confidence of a Brahman, acquainted with the Sanscrit language, and by this means learned pretty exactly the account of the origin of C. given in the *Law of Menu*, a work inferred to have been written not later than 900 B.C., which was long known only by name in Europe, until about the end of the last century, when a copy was obtained, and translated by Sir William Jones. The whole of the Hindus are represented by Menu as divided into four classes:

1. The *Brahmans*, or *sacerdotal class*, who are said, at the moment of creation, to have issued from the mouth of Brahma. Their business is reading and teaching the Vedas, and the performance of sacrifice for themselves and others. They are to be the chief of all created beings; the rest of mortals enjoy life through them. By their imprecations, they can destroy kings, with all their troops, and elephants, and pomps. Indra, when cursed by one of them, was hurled from his own heaven, and compelled to animate a cat. Hence, the Brahman is to be treated with the most profound respect, even by kings. His life and person are protected by the severest laws in this world, and the most tremendous denunciations for the next. His own offences are treated with singular lenity; all offences against him, with terrible severity. He is forbidden to live by service, but on alms; and it is incumbent upon virtuous men and kings to support him with liberality; and all ceremonies of religion involve feasts and presents to him. The first part of his life is to be devoted to an unremitting study of the Vedas—books, be it observed, older than the code of Menu, and yet, except, perhaps, one of the later hymns, containing no mention of C. as a religious ordinance. He is to perform servile offices for his preceptor, and beg from door to door. In the second quarter, he lives with his wife, reads and teaches the Vedas, assists at sacrifices, and, 'clean and decent, his hair and beard clipped, his passions subdued, his mantle white, his body pure, with a staff and a copy of the Vedas in his hand, and bright golden rings in his ears,' he leads a studious and decorous life. The third quarter of his life he must spend in the woods, as an anchorite, clad in bark, without fire, wholly silent, and feeding on roots and fruits. The last period he is released from external forms and mortifications, and is to spend his time meditating on the divinity, until at length he quits the body, 'as a bird leaves the branch of a tree, at pleasure.'

2. The *Kshatrya*, or *Chattrice*, or *military class*, sprang from the arm of Brahma, and bear something of a sacred character. It is stated that the sacerdotal order cannot prosper without the military, or the military without the sacerdotal; and the prosperity of both, as well in this world as in the next, is made to depend on their cordial union. The Kshatrya are to give alms, to sacrifice, to read the Vedas, and defend the people. Though Brahmins are to draw up and interpret laws, they are carefully excluded from administering them. The executive government is vested in the Kshatryas alone.

3. The *Vaisya*, or *Bais*, or *mercantile class*, sprang from the thigh of Brahma. Their grand duties are

\* In Sanscrit, castes are called *Varnas*, i. e., 'colours,' colour being, no doubt, the chief distinction at first.

to keep cattle, carry on trade, lend on interest, cultivate the soil, and turn their attention to every description of practical knowledge. They are to be perfect men of business.

4. The *Sudras*, or *Sooders*, or *servile class*, came from the *foot* of Brahma. They are to serve the three superior classes, more especially the Brahmins. Their condition is never to be improved ; they are not to accumulate property, and are unable by any means to approach the dignity of the higher classes. Utter and entire submissiveness to the Brahmins is the spirit of all a Sudra's duties, and this is to be enforced by penalties as severe as they are ridiculous. Yet, wthal, the Sudras were not to be slaves, either public or private, and to occupy a position much higher than the Chandals.

Mixture of castes, though not absolutely forbidden, entails disadvantages on the children, and the offspring of a Brahmanical woman and a Sudra becomes a Chandal, or outcast.

Such—omitting the minute and childish laws and penalties, many hundreds in number, by which it is proposed to carry the principle of C. into the pettiest affairs of life—is a brief outline of it, as gathered from the code of Menu. There is no historical evidence that it ever existed in this form, and, from the nature of the case, we may conclude that it never did. In the *Toy-cart*, the oldest Hindu drama, no extravagant veneration for Brahmins anywhere appears. In fact, one of them is condemned to death; and the arrangements of society appear to have been the same as at present. The laws of C. form, it is true, a part of what is reputed to be Hindu law, but they have remained in all the states of India, Hindu as well as Mohammedan, to a great extent a dead-letter. There is nothing to shew that the code of Menu was drawn up for the regulation of any particular state. Some have even conjectured that it may have been the work of some learned man, designed to set forth his idea of a perfect commonwealth under Hindu institutions, just as Plato in *The Republic* gives us his idea of a model government under Greek institutions.

Be this as it may, the C. which at present exists throughout the greater part of India is very different from that described in the code of Menu, though to this it owes, no doubt, much of its stability and its importance in the eyes of Europeans. With the exception of the Brahmins, the pure castes have disappeared, and out of the intermixture of the others have sprung innumerable classes, many of them unauthorised except by the people themselves. So engrained in the whole community is this tendency to class distinctions, that Mussulmans, Jews, Parsees, and Christians fall, in some degree, into it; and even excommunicated or outcast Pariahs form castes among themselves. Most of the existing castes partake of the nature of associations for mutual support or familiar intercourse, and are dependent upon a man's trade, occupation, or profession. Many of them have been described by Mr Colebrooke in the *Asiatic Transactions*, vol. v. Many have had their origin in guilds, in schism from other castes, in the possession of a particular sort of property (as, for instance, landlords are spoken of as the C. of *zemindars*), and similar accidental circumstances. Their names are often due to the district in which the C. took its rise, to their founder, to their peculiar creed, or any random circumstance. In the Bengal presidency, there are many hundreds of such castes, almost every district containing some unknown in those adjacent. Among the lowest classes, and especially among the servants of the English at Calcutta, it has degenerated into a fastidious tenacity of the rights and privileges of station. For example,

the man who sweeps your room will not take an empty cup from your hand ; your groom will not mow a little grass ; a coolie will carry any load, however offensive, upon his head, but even in a matter of life and death, would refuse to carry a man, for that is the business of another caste. Such and many other regulations are described in every work on C., but are as unworthy of serious regard as are the assertions of self-importance found among little people all the world over. When an English servant pleads that such a thing 'is not his place,' his excuse is analogous to that of the Hindu servant when he pleads his caste. When an Englishman of birth or profession, which is held to confer gentility, refuses to associate with a tradesman or mechanic—or when members of a secret order exclude all others from their meetings—or when any other similar social distinction arises, it would present itself to the mind of the Hindu as a regulation of caste.

Nor does C. at the present day, tie a man down to follow his father's business, except, perhaps, in the case of the more sacred functions of the Brahmins. For the rest, Brahmins serve as soldiers, and even as cooks. Men of all castes have risen to power, just as in England our statesmen have sprung from every class of society. Nor, again, is loss of C. anything so terrible as has been represented ; in most cases, it may be recovered by a frugal repast given to the members of the C.; or the outcast joins another C., among whom he will commonly be received with the heartiness due to a new convert. The question of the restoration of a Christian convert wishing to rejoin the Brahmanical C., has been differently decided by his fellow caste-men in different places.

As in the West, so in the East, C. enters into all the most ordinary relations of life, producing laws often most tyrannical and too anomalous to admit of generalisation. In the West, however, whilst good sense and Christianity have ever tended to ameliorate social differences, the feeble mind of the Hindu and the records of his religion have had a contrary effect.

These modified views of C., which have begun to prevail in recent years, will be found more fully developed in Shore's *On Indian Affairs*, Irving's *Theory and Practice of Caste*. Full accounts of the petty regulations of C., as laid down in the code of Menu, may be seen in Sir William Jones's *Translation of the Code of Menu*, Robertson's *Disquisition on India*, Richard's *India*, Elphinstone's *History of India*, Dubois's *India*, Colebrooke's *Asiatic Transactions*, vol. v., and in various articles in the *Calcutta Review*. The most authoritative account of the subject of caste is to be found in the first volume of Dr John Muir's *Original Sanscrit Texts on the Origin and Progress of the Religion and Institutions of India*; collected, translated into English, and illustrated by Notes (5 vols. Lond. 1867—1871; vols. 1 and 2, new ed.), a work of the utmost value.

The question how C. is to be dealt with in converts to Christianity, has now been determined by common consent of missionaries in India ; and it receives no recognition within the Christian church. An opposite policy, in former times, founded on the opinion that C. might be regarded as merely a civil or social institution, and not as a part of the religion of the Hindus, is now believed to have been among the principal causes of the comparative decay of the churches or congregations founded during the 18th c. in the south of India.

CASTE'GGIO, a town of Piedmont, Northern Italy, five miles east-north-east of Voghera. In the campaign of 1859, C. was occupied by Austrians

were defeated by the French and Sardinians. C. was also valourously but unsuccessfully defended by the Austrians in the great battle of Montebello between them and the army of Napoleon I in 1800. As *Clastidium*, C. was an important military position as early as the times of the Gallic and Punic wars. Some Roman antiquities still remain, and numerous curious inscriptions and coins have been found. Pop. 3206.

CASTEL (from the Latin *castellum*) is a name prefixed to various places in Italy, France, Spain, Portugal, &c., of which the most important are :

1. C.-ARQUATO, a town of Parma, North Italy, 19 miles south-east of Piacenza, picturesquely situated amid forests and vineyards, with a fine Gothic church and a noble old castle, from which the town derives its name. It has manufactures of silk, and a population of 4400.

2. C.-BOLOGNESE, a town of North Italy, about 22 miles west-south-west from Ravenna. It derives its name from a strong fortress built here by the Bolognese in the 14th c.; and is historically famous as the scene of a decisive battle between the Milanese and Florentines in 1434, in which the latter were completely vanquished.

3. C.-BUONO, a town of Sicily, in the province of Palermo, eight miles south-east of Cefalu. It is noted for its mineral springs, and has a trade in manna. Pop. 5288.

4. C.-FRANCO, a town of Central Italy, eight miles east of Modena, with the old walls and ramparts of a castle built by Urban VIII, and near the site of the battle between the consuls Hirtius and Pansa and Mark Antony.—Also the name of a town of Italy, in the government of Venice, about 25 miles north-west from the city of that name, with linen and woollen manufactures, and a population of 4220.

5. C.-GANDOLFO, a village of the former Papal States, 11 miles south-east of Rome, near the west shore of Lake Albano. Its situation is extremely picturesque, and it commands extensive views of some of the most beautiful scenery in Italy. The pope has his summer residence here. In early times, the noble family of the Savelli had a stronghold at C., by means of which, for a period of nearly 400 years, they bade defiance to popes, barons, and bourgeoisie. Pop. 1144.

6. C.-SARDO (formerly C. *Aragonese*), a fortified town and seaport, the strongest on the island of Sardinia, is situated on a steep rock on the north coast, 16 miles north-east of Sassari. The environs produce wine. Pop. 1946.

7. C.-SARRASIN, a town of France, in the department of Tarn et Garonne, on the Sanguine, 12 miles west from Montauban. It has the remains of an old castle said to be of Saracenic origin, a population in 1872 of 2967, manufactures of serge and worsted stockings, and a trade in the agricultural produce of the district.

8. C.-TERMINI (ancient *Camiciana Aquae*), a town of Sicily, in the province of Girgenti, and 16 miles north from the city of that name. It has extensive mines of rock-salt and sulphur, and a population of 6614.

9. C.-VETRANO, a town of Sicily, in the province of Trapani, 20 miles south-east of the town of that name. It is an interesting place with an old castle, several convents, manufactures of articles of coral and alabaster, and a population in 1872 of 20,420. Some of the most esteemed white wine of Sicily is produced in the vicinity.

CASTELLAMARÉ, a fortified city and seaport of South Italy, about 17 miles south-east of the city of Naples. It is built on the lower slopes of

south-east side of the Gulf of Naples, over which it commands a magnificent view. It is on or near the site of the ancient *Stabia*, which was desolated by Sylla during the Social War, and where the elder Pliny afterwards lost his life when the city was overwhelmed with lava from Vesuvius. Some ancient remains have been found here. The town was sacked in the 15th c. by Pope Pius II., and again in the 17th c. by the Duc de Guise. It has a royal palace, a cathedral, several convents, among which that founded by Gonsalvo de Cordova, in the 16th c., is famous for the possession of an image of the Madonna, found in a well in the 11th c., which is greatly venerated by the peasantry, who make an annual pilgrimage to the church. The old castle, which gave name to the town, was built in the 12th century. C. has a royal dockyard, affording employment to many of the inhabitants, and manufactures of linen, silk, cotton, leather, and sail-cloth. Pop. 26,381.—CASTELLAMARE is also the name of a town in Sicily, situated at the head of a gulf of the same name, and 20 miles east from Trapani. It has a population of 8986, and exports of cotton, wine, fruit, and manna.—C., GULF OF, is an extensive bay on the north coast of Sicily. Its width from east to west, between Point Uomo Morto and Cape St Vito, is about 15 miles; and its depth about 14 miles. It has deep water and good anchorage, but is much exposed to north winds.

CASTELLAMONTE, a town of North Italy, in the province of Turin, 10 miles south-west of Ivrea. It has an old castle, manufactures of earthenware, and a trade in the agricultural produce of the district. Pop. 6641.

CA'STELLAN, or CHATELAIN, the keeper of a castle or *burg* in the middle ages. The office and the rank of the C. were various in various countries. In France and Flanders, the title C. belonged to the holders of certain demesnes, and was next in order of rank to that of a bailiff. In Germany, the C. had the jurisdiction of a Burg-graf during the ages of chivalry. In Poland, the title of C., with its appendages, remained in later times, and, after the 16th c., the castellans, with the waiwodes and bishops, formed the senate or superior legislative chamber.

CASTELLANA, a town of South Italy, in the province of Bari, and 26 miles south-east of the city of that name. Its trade is confined to the produce of the district. Pop. 9691.

CASTELLANETA, a town of South Italy, in the province of Lecce, 20 miles north-west of Taranto. It has a cathedral and several convents. Cotton is grown in the district. Pop. 6525.

CASTELLAZZO, a town of North Italy, about 5 miles south-west of Alessandria. Pop. 5749.

CASTELLEONE, a town of Lombardy, North Italy, situated near the Oglio, about 12 miles north-north-west of Cremona. It is surrounded by old walls, has a fine church, and a population of 5700.

CASTELLIO, SEBASTIEN, a French theologian, was born in Dauphiné, in 1515. His proper name was Châteillon, which he Latinised, according to the usage of his time. About 1540, he was invited to Geneva by Calvin, and appointed Humanity professor; but having the misfortune, afterwards, to differ from the reformer in religious opinion, he was banished from the city, and went to Basel, where he spent the rest of his life in great poverty. See CALVIN.

Among his various writings may be mentioned

## CASTELLON—CASTILE.

*De Hereticis, &c.*—a treatise which argues against the right of the magistrate to punish heretical opinions, and which produced a reply from Beza; a Latin version of the Old and New Testaments, published in 1561, and dedicated to Edward VI. of England; and a posthumous work, in dialogue, on predestination, election, free-will, and faith, first published by Faustus Socinus in 1578.

**CASTELLO'N DE LA PLA'NA**, a town of Spain, capital of the province of the same name, is situated in the midst of a fruitful plain, about 4 miles from the Mediterranean, and 40 miles north-north-east of Valencia. A magnificent aqueduct supplies the means of irrigation. C. is surrounded by walls, and is for the most part well built. It has some handsome old churches, and a singular bell-tower 260 feet high. Ribalta, the celebrated Spanish painter, was a native of Castellon de la Plana. It has manufactures of linen, woollen, sail-cloth, paper, earthenware, and firearms; also brandy distilleries, and an active trade. Pop. 20,000.

**CASTELNAUDARY**, a town in the department of Aude, France, situated on a declivity, skirted at the base by the Canal du Midi, 22 miles from Carcassone. Pop. (1872) 7721. It has manufactures of woollen and silk fabrics, and earthenware, and carries on a lively trade in agricultural produce. The canal at this point expands into a large basin, which serves as a haven. It suffered dreadfully in the crusade against the Albigenses, and was, in 1212, the scene of a battle between Simon de Montfort and Raymond, Count of Toulouse. In 1355, it was captured by the Black Prince. In 1632, Marshal Schomberg here gained a victory over the party of the Duke of Orleans, when the brave Duke of Montmorency was taken prisoner, and afterwards executed at Toulouse.

**CASTELNUO'VO**, a seaport town of Dalmatia, Austria, situated near the west entrance of the Gulf of Cattaro. It is surrounded by walls, and defended by two forts and a citadel. It has manufactures of brass, and a trade in the produce of the district, which is fertile. It was captured by the British in 1814. Pop., including commune, 7886.

**CASTIGLIO'NE, LAKE OF**, a lagoon of Central Italy, in the province of Siena. It lies north of Grosseto, and has a length of about 10 miles, with a breadth of from 1 to 3 miles. Receiving the waters of the Bruna and other rivers, it discharges its water by a short canal into the Mediterranean.

**CASTIGLIO'NE, BALDASARE**, COUNT, one of the most elegant of the old Italian writers, was born, 1478, at Castrico, in the duchy of Mantua, and studied at Milan. His shining talents, knowledge, and pleasing manners made him a favourite of Guidobaldo di Montefeltro, Duke of Urbino, a great patron of literature, at whose court he was honourably entertained, along with other men of eminence in letters. He was employed by the duke as envoy to Henry VIII. of England, who made him a knight; and was afterwards sent in the same capacity to Louis XII. of France, under Guidobaldo's successor, in several important ambassadorial missions. He died at Toledo in 1529. His chief work is the book *Del Cortegiano*, a manual for courtiers, remarkable for its elegant style. His Italian and Latin poems are also models of elegance, and his *Letters* (2 vols., Padua, 1769—1771) contain interesting contributions to the political and literary history of his time. Tasso devoted a sonnet to the death of C., and Giulio Romano raised to his memory a monument in Padua.

**CASTIGLIO'NE, CARLO OTTAVIO**, COUNT, an eminent Italian philologist, was born at Milan in 1795. At an early period, he displayed a predi-

lection for antiquarian studies, more particularly numismatics. When only 24 years of age, he published a description of the Kufic coins in the cabinet of Brera, at Milan, under the title, *Monete Cufiche del Museo di Milano* (Milan, 1819), which shewed a great knowledge of oriental languages and history. C.'s principal work in the sphere of oriental literature is his *Mémoire géographique et numismatique sur la Partie orientale de la Barbarie appelée Afrikah par les Arabes, suivi de Recherches sur les Berbères Atlantiques* (Milan, 1826), in which he seeks to ascertain the origin and the history of the towns in Barbary whose names are found on Arabic coins. Out of Italy, C. is perhaps best known by his edition of some fragments of the Mosso-Gothic translation of the Bible by Ulphilas (q. v.), which had been discovered, in 1817, by Cardinal Mai among the palimpsests of the Ambrosian Library. At first, he published some specimens in conjunction with Mai, but in 1829, 1834, 1835, and 1839, appeared a variety of fragments of the Pauline epistles, edited by himself, and enriched with valuable disquisitions, commentaries, and glossaries.

**CASTIGLIONE DELLE STIVIERE**, a town of North Italy, 22 miles north-west of Mantua. It is walled, and defended by an ancient castle; but is chiefly celebrated on account of the victory obtained here by the French over the Austrians in 1796, and which gave the title of Duc de Castiglione to Marshal Augereau. Pop. 3716.

**CASTILE** (Spanish, *CASTILLA*) forms, in a geographical and political point of view, the central district of the Spanish peninsula, being the middle and most strongly marked plateau of Spain, as well as the central seat of the monarchy. Both geographically and politically it is divided into Old and New Castile—*Castilla la Vieja* and *Castilla la Nueva*. The former district, situated in  $40^{\circ} 5'$ — $43^{\circ} 32'$  N. lat., and  $1^{\circ} 40'$ — $5^{\circ} 35'$  W. long., rises, in the form of an elevated plateau, to the height of 2500—3000 feet. It is walled in on all sides: on the north, by the highest masses of the Cantabrian Mountains, which separate it from the Basque provinces and Asturias; on the south, by the high ridge forming the water-shed between the Douro and the Tagus; while the Sierras de Oca, de Urbion, and Moncayo, and the heights of Leon and Tras-os-Montes bound it on the east and west. The high plateau of Old C. is but scantily watered, and its natural characteristics far from inviting. In many parts, nothing is presented to the eye but a wide, unwooded, almost treeless waste of land, unrefreshed by streams, in some parts monotonously covered with stunted grasses, and in others, almost destitute of vegetation. The traveller may walk many miles without finding a village, or even a solitary farmhouse. All Old C., however, is not a dusty desert. There are rich tracts in it producing some of the finest wheat in the world. Madder and grasses are also produced abundantly in some parts; and even the olive flourishes where it is protected from the frost and snow of winter, and from the cold winds prevailing in October and the following months. Iron and other minerals exist in plenty, but are not worked to any great extent. Sheep, cattle, pigs, and mules form the chief wealth of the inhabitants. Manufactures consist of coarse woollens, cotton, linen, leather, and glass.

The plateau of New CASTILE—which is situated between lat.  $38^{\circ} 23'$  and  $41^{\circ} 15'$  N., and long.  $1^{\circ}$  and  $5^{\circ} 25'$  W.—like Old C., is also enclosed by mountains. Though lying 1800 feet lower than Old C., New C. presents many similar characteristics of soil and scenery. It is mostly sterile, and scantily

## CASTILLON—CASTING-NET.

irrigated; little rain falls, and the nightly dews are insufficient to refresh the plains, which are entirely destitute of trees, and, in summer, appear quite burned up. Olives, corn, pulse, and saffron, are cultivated in some neighbourhoods; but flocks of sheep constitute the chief wealth of extensive tracts of land. The commerce, carried on by means of long trains of mules, reminds the tourist of the caravan-train over eastern deserts. Industry is almost entirely restricted to manufacturers of coarse woollen goods. The yield of the salt-mines in the south is considerable; and quicksilver, especially at Almaden (q. v.), and iron (manufactured at Toledo) are plentiful. The Castilians have even more than the general haughtiness of the Spanish character. Their language prevails throughout the educated classes, as in the literature of Spain, and their rulers have extended their sway over the whole nation.

In the present administrative division of Spain into forty-nine provinces, the division of Old and New C., though it will long be remembered by the people, is one belonging to past history. Old C. is now divided into the eight provinces of Burgos, Logroño, Santander, Soria, Segovia, Ávila, Palencia, and Valladolid. The population, distributed over an area of 22,797 square miles, amounted in 1867 to 1,716,193. New C. includes the five provinces—Madrid, Guadalaxara, Cuenca, Toledo, and Ciudad Real, and on an area of 30,882 square miles, has 1,289,415 inhabitants. Besides these provinces, the kingdom of Leon, Galicia, the principality of Asturias, and the districts of Extremadura, Andalusia, Granada, and Murcia, belonged to the crown of Castile.

C. first became an independent country in 762, and remained so until 1028, when it passed to Sancho III., king of Navarre. His son, Ferdinand I. (Great), founded the kingdom of C., and among other acquisitions annexed to it the kingdom of Leon. This union, however, was not permanent, Leon being made a separate kingdom for Ferdinand II. The two kingdoms, however, were afterwards reunited in the 13th c. in the person of Ferdinand III., and remained ever after under one sceptre. Among the successors of Ferdinand III., the most distinguished was Alfonso X., by whose direction the Alfonsine (astronomical) tables were drawn up. By the marriage of Isabella, sister and successor of Henry IV., with Ferdinand, king of Aragon (1469), the two crowns of C. and Aragon became united (1479), and from these sprang the kingdom of Spain, which, however, was not fully established before the death of Ferdinand, in 1516, when Charles I. of Spain (Charles V. of Germany) inherited both crowns.

CASTILLON, a town of France in the department of Gironde, situated on the right bank of the Dordogne, 26 miles east of Bordeaux. It has manufactures of cotton and woollen yarns, nails, and cordage. It is celebrated as the scene of the battle between the forces of Henry VI. of England and Charles VII. of France, July 1453, in which the English met with a signal defeat, their leader, the Earl of Shrewsbury, and his son, being slain. Of all their possessions in France, Calais alone remained to the English after this battle, the incidents of which were seized on by Shakespeare for the sixth scene in his play of *King Henry VI.*, Part I. Pop. (1872) 3328.

CASTING, in Angling, is the term applied to the act of throwing a fly or a fish-bait. In casting a fly with a single-handed rod, the beginner should let out about as much line as the length of the rod; grasp the rod just above the reel; then wave it back over the right or left shoulder, with a slightly circular sweep, so as to extend the line behind;

and then bring it forward with a steady cutting kind of action, urging the point of the rod towards the spot where the fly is to fall, taking care not to carry the point of the rod too far forward, or too low, or the line will not fall straight and evenly on the water. The object of the circular sweep behind is to prevent the fly from cracking off. By slightly raising the point of the rod just as the fly is delivered, the line is straightened; and the fly, checked in mid career, falls like thistle-down upon the water. Always allow time for the line to go straight out behind, for if returned too quickly, the fly cracks off. In casting with the double-handed rod, the one hand grasps the rod above the reel, and the other below it, the lower hand acting as a pivot upon which the rod turns.

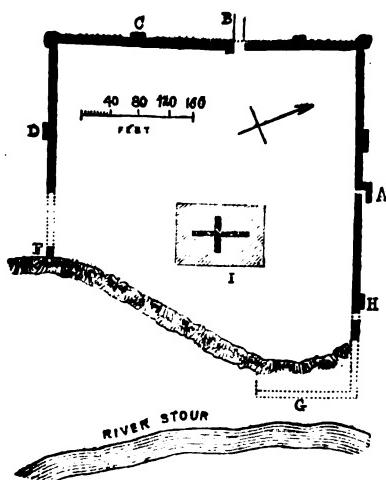

In casting a bait, either for spinning, trolling, or live-baiting, the bait is suffered to hang from the point of the rod about a yard. Taking the rod in both hands, the line clasped to the rod in his right, the angler waves the bait gently back; and having first drawn as much line as he requires off the reel, and laid it loosely at his feet, he sends the bait forward with a swing towards the point he desires to reach.

CASTING-NET, a species of net very widely distributed, having been found in use amongst various savage tribes in different parts of the world, some of whom, from long and constant practice, use it with a dexterity and address unknown in England. The nets used in England are usually from 13 to 20 feet in circumference when spread out. They are netted in the shape of a kind of long loose bag or cone; and so much is the number of meshes increased as the net progresses, that it is capable of being spread out in a perfectly flat and circular form, the apex of the cone forming the centre of the circle. To this apex is attached a rope of some yards in length; when casting, this rope is fastened round the left wrist of the caster. The bottom of the net, which forms, when it is held up by the apex, the base of the cone, or, when spread, the circumference of the circle, is hung around with perforated leads or bullets. These have not only the effect of carrying the net to the bottom of the water, but also, when it is cast, of causing the net to spread open. The bottom of the net is turned up some six inches or more in depth, and hung up on the inside about every ten inches or so, to an upper portion of the net, by stout strings, so as to form a kind of purse; this is called the 'tuck.' When the net is required to be cast, the caster, having fastened the rope to his wrist, and coiled it loosely in his left hand, hangs a portion of the net over his left shoulder; and then gathering as much of the outer edge of the net as he can collect in his right hand, and holding it up so as to open the net as much as possible, makes a semicircular sweep of the body and the right hand—rather difficult to accomplish without practice—and whirls the net away off the shoulder. The centrifugal motion thus communicated to the leads, &c., on the bottom of the net, causes it to open like a circle on the surface of the water, the leads carry it to the bottom, and the net thus covers all that comes within its circle. The rope is then pulled gradually, and worked from side to side, in order to narrow the circle, to bring it once more into a cone; and, in their efforts to escape, the fish that may have been covered are gradually driven into the tuck or purse of the net. When the leads are all close together, the net is lifted from the water, and the fish in the tuck are taken out. The cost of a cast-net is regulated by the circumference and the size of the mesh. They may be had from 12*s*. to 30*s*. or more.

## CASTING-VOTE—CASTLE.

**CASTING-VOTE**, the vote by which the chairman or president of a meeting is generally empowered to cast the balance on the one side or the other, where the other votes are equally divided. In the House of Commons, the Speaker does not vote at all unless this occurrence takes place. As his position in this respect is felt to be a delicate one for a person whose duty it is to withdraw himself from the contentions of party, it is usual for the Speaker to vote in such a way as to give the House an opportunity of reconsidering its decision. The same rule prevails in select committees. Following a similar rule, the chairman at corporation and general meetings usually gives his casting-vote either in a way that will lead to a reconsideration of the subject, or for what seems the popular view of the case, although that may be at variance with his convictions.

**CASTLE** (*Sax. castel*; *Lat. castellum*, dimin. from *castrum*), a building constructed for the purpose of repelling attack. The root of the word is the same as that of *caza*, a little house or hut, and probably means a driving off or repelling; and it is worthy of notice, in confirmation of this view, that in Welsh the radical syllable *ca*, signifies a C., separated, and also hatred, malice, &c. The *castella*, left by the Romans in Britain and elsewhere, were constructed on the general model of their stationary encampments (*castra stativa*), (see **CAMP** and **ENCAMPMENT**); and though they may have suggested the castles of the middle ages, they differed from them in being designed for military purposes only, and not also as places of permanent residence. Even Burgh Castle, in Suffolk, the ancient Garamonium, and Richborough Castle, in Kent, the ancient Rutupis, were encampments or fortresses, rather than castles. The accompanying ground-plan, taken from Mr Roach Smith's interesting work on the *Antiquities of Richborough* and other places in Kent,

Plan of Roman Castrum at Richborough :

A, postern gate; B, decuman gate; C, D, square towers; E, corner of south wall projecting over the cliff; F, return wall overthrown; G, site of tower in north wall; H, surface of subterranean building.

will give a better conception than any mere description of the remains of the most remarkable Roman castellated fort to be found in this country.

Besides these monuments of the military occupation of the island by the Romans, traces are found in various parts of the country of encampments or

castles, which are ascribed to its aboriginal or early inhabitants. These are generally situated on the tops of hills; as, for example, the Herefordshire Beacon, on the Malvern Hills; Moel Arthur, in Flintshire; Chem Castle, in Cornwall; the Maiden Castle, in Dorsetshire; the Caterthuns, near Brechin, in Forfarshire; the Barmkin of Echt, in Aberdeenshire. It is probable that the Saxons adapted the Roman castles to a certain extent to their modes of defence, and traces of Saxon, and even Norman workmanship are found in structures which are

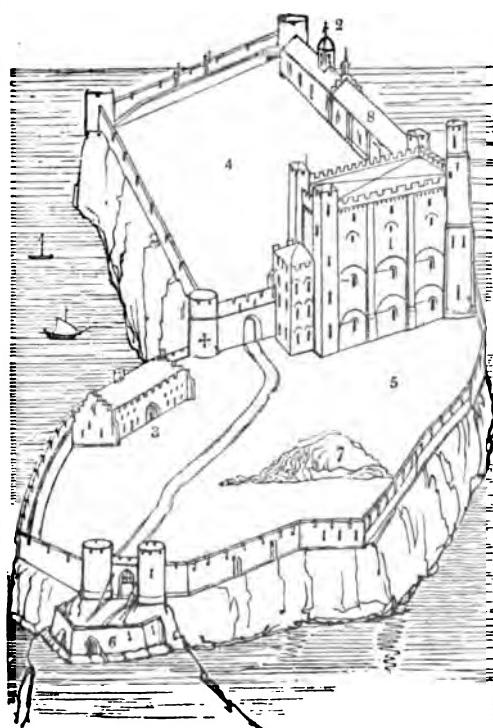

Roman Castellum.—From *Vatican Virgil*.

believed to have been originally Roman. One very frequent change consisted in raising a mound of earth on one side of the walls on which the keep or citadel was erected. The Decuman and Praetorian gates were also, as at Portchester, converted into the fortified entrances peculiar to the castellated structures of the middle ages. But of castles designed for residence as well as defence, there are few or none which are of higher antiquity than the Conquest. They were part of the organisation of the feudal system—castle-guard being one of the duties which the tenants were taken bound to pay in return for their lands; and till that system was developed by the Normans, the residences of persons of importance were probably guarded only by their domestic retainers, or, in extraordinary circumstances, perhaps by the national militia. The absence of strongholds is said to have been a reason why William the Conqueror so easily became master of the kingdom; and it was as a protection against the resentment which the Conquest occasioned, that most of the great Norman castles of England were built. As these castles grew in strength by the additions and improvements of each generation, they afforded their possessors the means not only of security from their fellow-subjects, but of independence as regarded the central government. The lord of every C. became a petty tyrant; and no small portion of the history of England, and, indeed, of Europe altogether, during the feudal period, consists of an account of the attempts which were made by the monarch to extirpate what Matthew Paris has emphatically designated as ‘these nests of devils and dens of thieves’. Of castles of this description, it is said that in England, in the reign of Stephen (1135–1154), no fewer than 1115 were built.

The Norman C., which was the most complete structure of the kind, was generally surrounded by a moat or ditch; and in order that the ditch might be readily filled with water, the site chosen was usually either on the banks of a river, or on a peninsula running into a lake. In the latter case, the ditch was of course merely a deep cut made through the neck of land, by means of which the C. and its surroundings were converted into an island. On the inner side of the ditch, mounds

## CASTLEBAR—CASTLES.

were constructed, which were surmounted with walls and towers, both of which, but particularly the latter, were supplied with battlements and bastions. The entrance-gates were also protected by towers, which were usually of great strength. The communication was by a bridge, sometimes of stone, but usually of wood, which was made to draw up and down; and the entrance, in addition to thick folding-doors, was protected by a Portcullis (q. v.), which was dropped down through grooves in the masonry at the sides. The gateway, in castles of the larger sort, was further defended by a Barbican (q. v.). On passing the external wall, you entered the Bailey (q. v.), which sometimes consisted of several courts, and contained the barracks, magazines, well, a chapel, and sometimes even a monastery. The only portion of the C. which was always spoken of as distinguished from the bailey, was the Keep (q. v.) or citadel, which corresponded to the praetorium of the Roman fortification. The keep was a species of internal C., more strongly defended than any other portion of the fortress, and placed in the most advantageous position, so as to afford a last chance to the garrison when driven from the external works. As the keep had the same design as the C. itself, it contained most of its appliances, even to a chapel, when large and complete. Under the keep was the Dungeon (q. v.). An excellent example of a keep is seen at

A NORMAN CASTLE.—From an Ancient Drawing published in Grose's *Military Antiquities*:

1. The Dungeon;
  2. Chapel;
  3. Stable;
  4. Inner Bailey;
  5. Outer Bailey;
  6. Barbican;
  7. Mount;
  8. Soldiers' Lodgings.
- The Mount is supposed by Grose to be the Court-hill, where the lord dispensed justice, and where it was also executed.

Rochester Castle. The best known is probably that at Windsor, which forms so prominent an object in the surrounding landscape. The protection which

the walls of his C. afforded to the retainers of a baron, in a state of society in which life and property were extremely insecure, naturally led to the construction of houses around the moat, and to this custom a very large number of the towns, both in England and on the continent of Europe, owe their origin. Along the banks of the Rhine, this process of town-formation may be seen in all its earlier stages; from the few peasants' houses and the village church nestling under the ivy-covered ruin on the cliff, to the large and prosperous city of Coblenz. Strange as it may seem, the existence of these castles may be regarded not only as a cause, but as an effect of a certain feeling of security on the part of the surrounding population; for where a country was thoroughly insecure, the risk of the castles falling into the hands of the enemy, and thus proving a source not of protection but of oppression, was so great as to prevent their erection. It is on this ground that Sir Walter Scott explains the slight character of the fortresses on the Scottish border, notwithstanding centuries of warfare. 'It was early discovered that the English surpassed their neighbours in the arts of assaulting and defending fortified places. The policy of the Scotch, therefore, deterred them from erecting upon the borders buildings of such extent and strength, as being once taken by the foe, would have been capable of receiving a permanent garrison. To themselves, the woods and hills of their country were pointed out by the great Bruce as their safest bulwarks; and the maxim of the Douglases, that "it was better to hear the lark sing, than the mouse cheep," was adopted by every border chief.' For these reasons, 'we do not find, on the Scottish borders, the splendid and extensive castles which graced and defended the opposite frontier. The Gothic grandeur of Alnwick, of Raby, and of Naworth, marks the wealthier and more secure state of the English nobles.' The residence of the Scottish chieftain 'was commonly a large square battlemented tower, called a keep or pele, placed on a precipice, or on the banks of a torrent, and, if the ground would permit, surrounded by a moat. In short, the situation of a border-house, encompassed by woods, and rendered almost inaccessible by torrents, by rocks and morasses, sufficiently indicated the pursuits and apprehensions of its inhabitants.'

—*Minstrelsy of the Scottish Border*, Introduction.

CASTLEBAR, the capital of the county of Mayo, Ireland, 159 miles west-north-west of Dublin. It is situated on the Castlebar river, near the head of a valley at the north-west end of the great limestone plain which includes the greater part of the counties of Roscommon, Sligo, Galway, and Mayo. The two main streets cross each other, and the chief buildings are in a square near the west end. The suburbs, as in most of the west Irish towns, consist of the wretched hovels of agricultural labourers. Pop. (1871) 3508. C. has some coarse linen manufactures. Here the Irish, in the rebellion of 1641, massacred the English parliamentary army, and in 1786 was executed the famous 'fighting Fitzgerald.' In 1798, the French general, Humbert, held the town for a fortnight. In 1846 and 1847, C. suffered extremely from the famine.

CASTLEREA'GH, LORD. See LONDONDERRY, MARQUIS OF.

CASTLES, in Heraldry, are often given as charges in the shields of persons who have reduced them, or been the first to mount their walls in an assault. The practice of heralds, in this as in other respects, has not been very consistent, as we learn that in 1602, a castle was granted by William Cambden, Clarendon King of Arms, to William Frear, doctor of physic:

## CASTLETON—CASTOR OIL.

**CA'STLETOWN**, the capital town and seat of government of the Isle of Man, called in Manx *Balley Cushtal*, or the Town of the Castle. C. is situated on the margin of Castletown Bay, near the southern extremity of the island, and surrounds Castle Rushen, a Danish fortress of prodigious strength, having walls from 12 to 18 feet in thickness, built of the limestone found on the spot, which is of so imperishable a nature that the sharp angles of the keep retain the marks of the builder's chisel, though completed in the 10th century. The castle was founded by Guthred II. of the Orrys kings of Man, and having been added to from time to time, it now consists of a pile of building of a most imposing appearance. It underwent a six months' siege by Robert Bruce in 1313. The keep is used as the public jail of the island, and the other portion of the castle consists of public offices, officers' apartments, and accommodation for the chancery and other superior courts.

Being in the neighbourhood of the bold coast-scenery of the Calf of Man, Spanish Head, &c., C. is a desirable resort for the numerous tourists who frequent the Isle of Man. Ship-building has of late made considerable progress in Castletown. Population in 1871, 2320.

**CA'STOR** and **POLLUX**, the two principal stars in the constellation Gemini (q. v.), were so called from Castor and Pollux, sons of Leda and Tyndareus, king of Lacedaemon. Their sister was the famous Helen of Troy. On account of their mutual attachment, Zeus placed them among the stars.

**CASTOR AND POLLUX**, the name given to a meteor, seen at sea, and which, under the form of twin balls of fire, attaches itself to the masts of ships. Sailors predict fair weather from its appearance. Sometimes, however, only one ball of fire is seen; the meteor is then called Helena, and it is regarded as foreboding a storm. Shakespeare makes mention of this superstition in the *Tempest* (Act i. Scene 2).

**CASTOR OIL**, a fixed oil obtained from the seeds of the C. O. plant. In extracting the oil, the seeds are first bruised between heavy rollers, and then pressed in hempen bags under a hydraulic or screw press. The best variety of oil is thus obtained by pressure in the cold, and is known as *cold-drawn* C. O.; but if the bruised and pressed seeds be afterwards steamed or heated, and again pressed, a second quality of oil is obtained, which is apt to become partially solid or frozen in cold weather. In either case, the crude oil is heated with water to 212°, which coagulates, and separates the albumen and other impurities. Exposure to the sun's light bleaches the oil, and this process is resorted to on the large scale. When pure and cold drawn, C. O. is of a light-yellow colour; but when of inferior quality, it has a greenish, and occasionally a brownish tinge. It is somewhat thick and viscid. Its specific gravity is high for an oil, being about 960 (water being taken as 1000). It is miscible with alcohol or spirits of wine and ether. Reduced to a temperature of 0° F., it does not become solid; but exposed to the air, it very slowly becomes rancid, then dry and hard, and serves as a connecting-link between the drying and non-drying oils. It has a nauseous smell, and an acrid, disagreeable, and sickening taste, which may be overcome by the addition of a little magnesia. The principal acid present in it is *ricinolic acid* ( $\text{HO},\text{C}_{18},\text{H}_{34},\text{O}_5$ ), which is allied to oleic acid.

C. O. is one of the most convenient and mildest of purgative medicines. Given in doses of one or two tea-spoonfuls, with a little peppermint-water, it forms a gentle laxative for habits easily acted

on by medicine; while a dose of a table-spoonful, or a little more, will almost always succeed if it remains on the stomach. The only serious objections to the use of C. O., are its disagreeable flavour, and the sickness often produced by it; some persons get over this difficulty by floating the oil in hot coffee, which is said to remove its nauseous quality.

The adulterations of C. O. may be various. Several of the fixed oils, including lard, may be employed. The best test of its purity is its complete solubility in its own volume of absolute alcohol, which other fixed oils are not. Croton oil is occasionally added, to increase the purgative power of the oil.

The **CASTOR-OIL PLANT** (*Ricinus communis*) is a native of the south of Asia, but now naturalised in the south of Europe, and in other warm regions of the globe. The genus *Ricinus* belongs to the natural order *Euphorbiaceæ*. It has panicled flowers, with 3—5-partite perianth; the fruit a trilococous capsule, with one seed in each cell, the outside of the capsule generally covered with soft spines. The castor-oil plant is often cultivated in gardens in the middle, and even in the northern parts of Europe, where it is only an annual, attaining a height of 3—10 feet, but highly ornamental by its stately growth, its large, broad, palmato-peltate, 7—9-fid leaves,  $\frac{1}{2}$ —2 feet in diameter, and its generally purplish hue. Its flowers are produced in long glaucous racemes. In warmer climates, it is perennial,

Castor-oil Plant:  
a, end of a branch, with leaves and flowers; b, a capsule.

and its stem becomes arborescent, attaining even 30 feet in height, with a corresponding thickness, so that ladders are used for climbing it. Different species which have been described, are probably mere varieties. It was known to the ancients, and appears to have been valued by them. Its seeds have been found in Egyptian sarcophagi. From the resemblance of its seeds to an insect called *ricinus*, it received that name from the Romans. The seeds are oval, and about four lines long. They are chiefly valued for the oil which they yield, on account of which the plant is cultivated in the Levant, Spain, Provence, the West Indies, Brazil,

the United States of America, as far north as New Jersey, and in other tropical and warm temperate countries.—Although castor oil is chiefly used in medicine, it is not unfit for lamps and for oiling the wheels of machinery. The streets of Lima are lighted, and the machines used in the works of the sugar-plantations of Peru are oiled with it. The appearance of the castor-oil plant obtained for it the name of *Palma Christi*, by which it is still sometimes called. Its seeds were formerly known as *semina cataputia majoria*.

CASTORÉUM, a substance secreted in two glandular sacs, closely connected with, but quite distinct from, the organs of reproduction in the Beaver (q. v.), and at one time held in the highest repute in medicine, although now regarded as almost inert, and chiefly used by perfumers. The C. sacs are pear-shaped, and it appears in commerce in these sacs themselves, connected in pairs as they are taken from the animal. C. is produced both by the male and by the female beaver. In Hudson's Bay commerce, ten pair of them are equal in value to one beaver skin. Russian C. is of much higher value than American. C. was well known to the ancients. From the time of Hippocrates, it was regarded as having a specific influence over the uterus, and is still in use in the north of Europe. It was at one time also esteemed a most valuable medicine in hysteria, catalepsy, and other spasmodic diseases.

CASTORIDÆ, a family of *Mammalia*, of the order *Rodentia*, of which the Beaver (*Castor*) is the type, and in which besides the beaver, the Coypu (*Myopotamus*), and the *Musquash*, some naturalists include other genera more commonly regarded as belonging to the Mouse and Rat family (*Muridae*), as the Lemmings and Voles.

CASTRAMETATION is the art of encamping; and a camp is the result of that art. See CAMP, ENCAMPMENT.

CASTREN, MATTHIAS ALEXANDER, the greatest authority in regard to the Finnish people and language, was born in 1813, not far from the Lappish boundaries of Finland. He received his earliest instruction in the town of Tornea, and afterwards studied at Helsingfors. About the year 1838, he undertook a pedestrian excursion through Finnish Lapland, in order to extend his knowledge of the language and literature; and, in 1840, another through Carelia, to collect ballads, legends, &c., illustrative of Finnish mythology. On his return, he published in Swedish a translation of the famous Finnish poem, *Kalevala*, the metre and style of which have been imitated by Longfellow in his poem of *Hawatha*. Aided by the government of his native province, he commenced his researches among the Finnish, Norwegian, and Russian Laplanders, as also among the European and Siberian Samoyeds. Appointed linguist and ethnographer to the St Petersburg Academy, C., between the years 1845 and 1849, prosecuted his laborious investigations as far east as China, and as far north as the Arctic Ocean. On his return, he was appointed first professor of the Finnish language and literature at the university of Helsingfors. He employed himself in preparing for publication the vast materials which he had collected, but died 7th May 1852, from exhaustion—a martyr to science. Before his death, appeared *Verzeichniss einer ostjakischen Sprachlehre nebst kurzen Wörterverzeichniss* (Petersburg, 1849), as the first instalment of his *Northern Travels and Researches*. He also wrote *Elementa Grammaticae Syraenae* (Helsingfors, 1844), and *Elementa Grammaticae Tcheremissa* (1845); *On the Influence of the Accent in the Lappish Language* (Petersburg, 1845);

*De Affixis Personalibus Linguarum Altaicarum* (Helsingfors, 1850), &c.

CASTRES, a town of France, in the department of Tarn, is situated on both sides of the river Agout, 46 miles east of Toulouse. The two parts of the town are united by two stone bridges. In the middle ages, C. was celebrated for its Benedictine abbey, the heads of which exercised a temporal sway over the place. Later, it was one of the strongholds of the reformed party, but it was forced to submit, and had its fortifications demolished in the reign of Louis XIII. C. has beautiful promenades, shaded by fine alleys of trees, and in the neighbourhood is a remarkable rocking-stone, 11 feet high, and weighing some 30 tons. It is of egg-shape, and rests upon its smaller end; a strong push is sufficient to cause its vibration. C. is a busy manufacturing place. Its fine wool-dyed goods are especially famous, and it has also manufactures of linen, leather, paper, soap, &c. Pop. (1872) 16,458.

CA'STRI, or KASTRI, a village of modern Greece, in the government of Phocis, situated on the south declivity of Mount Parnassus, and worthy of notice, as occupying a portion of the site of the ancient Delphi (q. v.). The famous Castalian spring, now called the Fountain of St John, is situated between 200 and 300 yards to the east of the village. Beside it grows a plane-tree, the only one in C., which is fabled to be that planted by Agamemnon.

CA'STRO (ancient Mitylene), a seaport town of Asiatic Turkey, capital of the island of Mitylene, situated on the east coast, about 55 miles north-west of Smyrna. It is surrounded with walls, and defended by a castle, and its streets are narrow and dirty. Remains of the ancient town are found to the west. Pop. 6500.

CASTRO, INES DA, whose mournful fate is the subject of several tragedies and poems, was the daughter of Pedro Fernandez de Castro, and sprang from a branch of the royal family of Castile. She was appointed lady-in-waiting to the wife of Dom Pedro, son of Alfonso IV. of Portugal. Her beauty captivated Dom Pedro, and, after the death of his wife, in 1345, he secretly married Ines. Their stolen interviews took place in the convent of St Clara, at Coimbra, until the secret was discovered and revealed to the king, who was made to believe that this union might prove injurious to the young Ferdinand, son of Dom Pedro by his deceased wife. Questioned by his father, Dom Pedro had not the courage to reveal the whole truth, while he refused to marry another. In the king's council, it was determined that Ines must die. To see this sentence executed, the king hastened to Coimbra, while his son, Dom Pedro, was engaged in hunting (1355); but the sight of the beautiful Ines, who, with her children, cast herself at the feet of the king, and prayed for mercy, diverted him for a few moments from his purpose. His advisers, however, soon obtained from the king permission to execute the sentence, and, in the course of an hour after the interview, Ines fell pierced by the daggers of assassins. Dom Pedro attempted a revolt against his father, but was pacified by the queen and the Archbishop of Braga, and promised not to seek revenge for the death of Ines. Two years afterwards, the king died, having shortly before his death recommended the murderers of Ines to leave Portugal, and seek shelter in Castile, where Peter the Cruel was then ruling. As several of Peter's nobles had escaped into Portugal, to avoid his oppression, he now proposed to Dom Pedro an exchange of fugitives, to which the latter (now king of Portugal) consented. Two of the assassins accordingly were delivered up, and were tortured and burned. Two

by papal sanction, and in the presence of the Archbishop of Guarda, to Ines de Castro. When this statement had been confirmed by several testimonies, the king gave orders that the corpse of Ines should be removed from its grave, clothed in royal attire, with a crown on the head, and seated on a throne, should receive homage as queen. This strange ceremony was performed, the nobles of Portugal bowing before the enthroned dead, and kissing the hem of the royal robe. The body was then removed to Alcobaça followed by the king, with the bishops and the nobility, all on foot. A splendid marble monument was erected over the grave of Ines, surmounted by her statue, wearing a crown.

CA'STRO DEL RIO, a town of Andalusia, Spain, situated on a slope on the right bank of the Guadajocillo, 16 miles south-east of Cordova. A portion of the old town is surrounded by ruinous walls; the new town lying outside of these has some good streets. It has manufactures of woollen and linen fabrics, earthenware, &c., and considerable trade in agricultural produce. Pop. 9100.

CA'STRO-GIOVANNI, a town of Sicily, in the province of Catania, is situated 13 miles north-east of Caltanissetta, on a remarkable fertile plateau, which rises precipitously to a height of 4000 feet above the sea-level. C. occupies the site of the ancient *Enna*, of which Ceres was the presiding goddess, and her most famous temple was here. The neighbourhood was the scene of Proserpine's abduction by Pluto. In connection with the Punic and Servile wars, Enna has a conspicuous part in early history. There are no remains of the old town. A castle and other buildings of Saracenic origin are still standing. The district yields large quantities of sulphur. Pop. (1872) 14,633.

CASTRNUO'VO, a town of Sicily, in the province of Palermo, 25 miles north of Girgenti. It is situated on a hill, is fortified, and in its vicinity are quarries of fine marble. Pop. 4029.

CASTROVILLA'RI, a town of South Italy, in the province of Cosenza, 34 miles north of Cosenza. It is situated on an eminence surrounded by mountains, is partially fortified, and has an old massive castle, and a trade in wine, manna, silk, &c. Pop. 7931.

CASTUE'RA, a town of Extremadura, Spain, 68 miles east-south-east of Badajoz. It is situated near the right bank of the Guadalefra, has several good streets, manufactures of brick, earthenware, &c., and a trade in agricultural produce; there is also some weaving carried on. Pop. 5600.

CA'SUAL POOR are persons temporarily relieved without being admitted to the roll of permanent paupers. See POOR-LAWS.

CA'SUALTIES OF SUPERIORITY, in the feudal law of Scotland, are such emoluments arising to the superior as depend on uncertain events. See WARD-HOLDING.

CASUARI'NA, a genus of trees of the natural order *Amentaceae*, and of the sub-order *Casuarinae*, which is regarded by some as a distinct natural order. The trees of this genus are almost exclusively Australian; one only, *C. equisetifolia*, being found in the South Sea Islands, the Indian Archipelago, the Malayan peninsula, and on the east side of the Bay of Bengal, as far north as Arracan. Some of them are large trees, producing timber of excellent quality, hard and heavy, the *Beef-wood* of the Australian colonists, so called from the resemblance in colour to raw

666

beef. The Society Islands, where it grows chiefly on the sides of hills, and where its wood was formerly used for clubs and other implements of war. It has been introduced into India, and is there much valued, as its wood bears a great strain, and is not readily injured by submersion in water. The hardness and durability of this wood led the earlier voyagers to the South Sea Islands to designate it *Iron Wood*. *C. quadrivalvis* is the SHE OAK of New South Wales. CASSOWARY TREE is a popular generic name of the *Casuarina*. Some of the species are scrubby bushes. All of them have a very peculiar appearance, their branches being long, slender, wiry, drooping, green, jointed, with very small scale-like sheaths instead of leaves. They resemble arborescent *Equisetum*. The fruit consists of hardened bracts, collected in a *strobilus*, or cone, and enclosing small winged nuts. The flowers have neither calyx nor corolla; the stamens and pistils are in separate flowers, the male flowers with only one stamen, the female flowers with a one-celled ovary, the male flowers in spikes, the female flowers in dense heads. More than 20 species are known.

CA'SUISTRY, called by Kant the *dialectics of conscience*, is that branch of theology and morals which professes to deal with very delicate moral questions—*casus conscientiae*—and which supplies rules and principles of reasoning for resolving the same; drawn partly from natural reason and equity, and partly from the authority of Scripture, the canon law, councils, fathers, &c. C. has been, and still is, studied chiefly by Roman Catholic theologians; but at one period Protestant divines also paid some attention to the perilous science. The rudiments of it, however, are to be sought for in antiquity. Traces of it are found in the Stoic philosophers of ancient Greece. This is not to be wondered at, for C. is not, in its essence, a device of the schoolmen, although the latter elaborated it into a science, but a natural expression of the intellect and moral nature of man, when he is placed in circumstances of great perplexity. The sound and healthy reason of antiquity, however, could not enter into the morbid refinement, or rather the insidious corruption of morals found in certain Jewish and Christian writers. The *Talmud* (q. v.) contains an enormous accumulation of casuistical questions, while the sphere of Christian ethics in the middle ages often became a mere arena for unprofitable and pernicious disputation of this nature, as is seen in such works as the *Summa Raymondiana*, *Summa Astensis*, *Summa Bartholomaei*, which obtained their names from their respective compilers. At a later period, the Jesuits Molina, Escobar, Sanchez, Busenbaum, &c., became notorious for their abuse of ingenuity in the construction of moral puzzles, and for the flagrant immorality of their solutions. Some of them still 'suffer the vengeance' of Pascal's immortal satire. It is nevertheless indubitable, that in the life of every man—now as formerly—*casus conscientiae* will at times arise, when the higher laws of morality come into collision with subordinate conventional ones. The dubiety as to what the path of duty is, what *ought* to be done, resulting from this collision, naturally and legitimately leads to many nice considerations. If these are carried on under the guidance of a pure conscience, no harm can ensue, but, on the contrary, much good. Such, however, is not the *perverted* C. of the Jesuits, 'the art of quibbling with God,' as M. Le Fevre, preceptor to Louis XIII, called it, in which a man seeks to justify, by subtle quirks, his immoral actions. Mayer has published an

## CASUS BELLI—CAT.

account of all the writers on cases of conscience, ranging them under three heads—Lutheran, Calvinistic, and Romish.

CA'SUS BELLI, or a case of war, is the reason alleged by one power for going to war with another. It is found impossible to reduce these causes or reasons to any definite code, because an ambitious or aggressive power has no difficulty in making a reason to declare to others, without acknowledging the real reason.

CAT (*Lat. catus*), a name sometimes extended to the whole family of quadrupeds designated by zoologists *Felidae* (q. v.), the genus *Felis* of Linneus; and sometimes more restrictedly applied to a section of that family, containing a number of its smallest species, the domestic cat and species most nearly allied to it. These form the subject of the present article. They all pursue their prey on the branches of trees more than on the ground, and are most expert climbers, in which, however, they are rivalled by some of the other *Felidae*.

The origin of the domestic C. is by no means well ascertained; and by some naturalists it is described as a distinct species, under the name *Felis domesticus*, which perhaps may be regarded as at least a convenient provisional designation, until satisfactory reasons can be adduced for referring it to some species existing in a wild state. By many, indeed, the domestic C. has been confidently pronounced to be a mere domesticated variety of the common Wild C. (*Felis Catus*) of Europe and the north of Asia; but to this there are many objections; the most important being that it is always of smaller size, contrary to what is usually observed of the effects of domestication in animals; and that in cats of the domesticated race which have run wild, and in their known progeny, there is no appearance whatever of a tendency to return to the type of the true wild cat.—Another opinion as to the origin of the domestic C. has obtained the assent of a considerable number of naturalists; that it is derived from the *Felis manulata*, or Gloved C. of North Africa, a species discovered by the celebrated traveller Rüppell. But Mr Owen has stated a perfectly conclusive reason against identifying the domestic C. with the *Felis manulata*, that the first deciduous molar tooth in the latter has a relatively thicker crown, and is supported by three roots, whilst the corresponding tooth both of the domestic C. and of the wild C. of Europe has a thinner crown, and only two roots.

The certainty, however, that the C. existed as a domestic animal in ancient Egypt, makes it not improbable that we ought to look for its original on the banks of the Nile, or in some of the countries from which the ancient Egyptians might most readily have obtained it. Of its rarity in Britain in former times, when the wild C. was common in all the woods which covered so much of the island, a curious evidence is afforded by a Welsh law quoted by Pennant—a law of the reign of Howel the Good, who died in 938 A.D.—fixing the prices of cats according to their age and qualities, beginning with a price for a kitten before it could see, and enacting that if any one stole or killed the C. that guarded the prince's granary, he was to forfeit a milk ewe, its fleece and lamb; or as much wheat as when poured on the C. suspended by its tail, the head touching the floor, would form a heap high enough to cover the tip of the tail.

It is needless to describe an animal so well known as the domestic C., or to do more than allude to its purring, its mewing, and the other sounds which it makes, its aversion to wet its feet or fur, its love of heat and comfort, its stealthy manners when in

quest of prey, its patient watchfulness, so often fatal to mice, and other points of its natural history with which everybody is familiar.

The delight which a C. takes in tormenting a mouse before killing it, has sometimes been mentioned as an apparent exception to the general character of goodness manifest in the instincts of animals. It is an interesting circumstance, however, that when the prey is a bird instead of a mouse, a C. immediately inflicts a mortal wound, as if aware of its greater power of effecting its escape.

The eye of the C. is capable of much contraction and dilatation of its pupil, so that the animal can see in a very feeble light, and is thus adapted for those nocturnal habits to which, even in domestication, it shews so strong a natural tendency.

The fur of the C. is very free from any oily substance, so as to be readily injured by water, and is capable of being rendered highly electric by friction, particularly in very dry or frosty weather. An electric spark is readily obtained from the tip of the ear.

The strong statements of Buffon gave for a time great currency to the opinion, that the C. is incapable of affection, and retains, even in a domesticated state, its savage ferocity, merely restrained by selfishness, and disguised by cunning. The belief is very prevalent that the C. forms an attachment to places only, and not to persons. There are, however, well-authenticated stories which prove the C. to be capable of strong attachment to its master or mistress, although this quality is less frequently and remarkably displayed than by the dog. The instances which have, on the other hand, been recorded to shew the attachment of the C. to places, are well worthy of attention in connection with the subject of instinct in animals. Some of these instances of cats finding their way back from great distances to their former home, are very wonderful, and indeed cannot be explained on any grounds or principles known. The same instinct and power, however, are displayed by other animals.

The varieties of the domestic C. are neither numerous nor very different. The *Tortoise-shell C.* differs from the most common variety chiefly in colour, although it is also particularly elegant and delicate in form. It is much more common in the south of Europe than in Britain.—The *Angora C.* is a beautiful variety, remarkable for its long silky hair.—The *Chinese C.* has a fine glossy fur, and is remarkable for its pendulous ears.—The *Chartreuse* is of a bluish colour.—It is supposed that the *Tabby* may have undergone less change by domestication than any other variety.

The wild C. is still to be found in a few of the woods of the north of England, in the mountains of Wales, the Highlands of Scotland, and some parts of Ireland. It has entirely disappeared from districts where it was once common. It is the only beast of prey remaining in Britain the strength and fierceness of which make it at all dangerous to man; but an encounter with a wild C. is safe only to a man well armed. Fortunately, the instances of its attacking when unmolested are rare, but such instances have occurred. The wild C. is an inhabitant of deep thickets and recesses of woods, and of the rocky and bushy ravines of mountainous districts. Its fur is held in considerable estimation. The fur is soft, long, and thick. The colour of the face is yellowish-gray, with a band of black spots towards the muzzle; the forehead is brown; the head is gray, with two black stripes passing from the eyes, over and behind the ears; the back, sides, and limbs are gray, darker on the back, paler on the sides, with a blackish longitudinal stripe along the middle of the back, and numerous paler curved

ones on the sides; the tail is ringed with light-gray and black, the tip being black. The length of a medium-sized male wild C. is almost 2 feet, exclusive of the tail, but this length is sometimes very considerably exceeded.—We know no record of any attempt to domesticate the wild cat.

Wild Cat.

The animal often called wild C. in America is the Bay Lynx. See LYNX.

*Superstitions regarding Cats.*—Cats have been objects of superstition from the earliest ages. In Egypt, they were held in the highest reverence; temples were erected in their honour; sacrifices and devotions were offered up to them; and it was customary for the family in whose house a C. died to shave their eyebrows. In the middle ages, they were regarded as the familiars of witches. The favourite shape of Satan was said to be that of a black C.; and the animal was an object of dread instead of veneration. There is or was a belief among sailors, that the frolics of a C. at sea portended a storm. Many people still prophecy rainy weather from a C. washing its face; and a cat-call on the house-top was formerly held to signify death. Their supposititious connection with witches, and the foolish belief that a C. has nine lives, have led to the perpetration of great cruelties upon this harmless and very useful domestic animal. See Brand's *Popular Antiquities*, Ellis's revised edition.

CAT, on shipboard, is a name for many of the ropes or lines employed. A *cat-fall* is a rope for heaving up the anchor from the water's level to the bow; it works through *cat-blocks*, and is connected with the *cat-head*. *Cat-harpings* are small ropes for tightening the shrouds. The *cat-heads*, just named, are two strong short timbers projecting from the bow, on each side of the bowsprit. A *cat-hook* fastens the ring of the anchor to the *cat-block*.

CAT, or CAT-CASTLE, in the military engineering of the middle ages, was a kind of movable tower to cover the sappers as they advanced to a besieged place. The garrison sometimes poured down burning pitch and boiling oil from the walls upon the C.; but occasionally this stratagem was disastrous, for the besiegers availed themselves of the blazing tower to burn the wooden gates of the town or fortress.

CAT-O'-NINE-TAILS. See FLOGGING.

CATABRO'SA (Gr. *catabrosis*, a gnawing), a genus of grasses formerly included in *Aira* (see HAIR-GRASS), but distinguished by the leathery *palææ*, which are ribbed, truncated, erose (as if gnawed at the points), awnless, and nearly equal. The glumes are much shorter than the spikelets,

membranaceous, and very obtuse. The general appearance is different from that of the genus *Aira*.—*C. aquatica* is a pretty common British grass. It is of very wide geographic and climatic

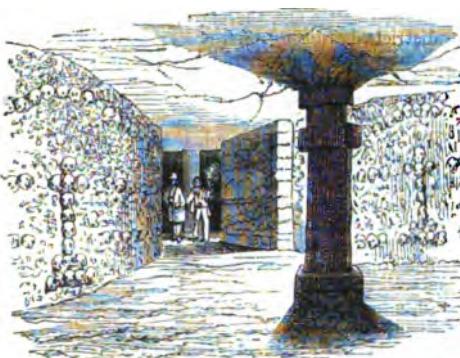

*Catabrosa aquatica*:  
a, panicle; b, part of stem, with roots and leaves; c, a spikelet;  
d, glume.

range, being found throughout Europe, from Lapland to the Mediterranean, and also in the torrid regions of South America. It grows only in very moist situations, as the muddy margins of lakes and rivers, ditches, &c., and is only cultivated in irrigated meadows, or on the banks of rivers subject to be overflowed by high tides, where the ground is always wet and muddy. It is one of the most valuable grasses for such situations, its foliage being peculiarly sweet, and much relished by cattle. Both its foliage and its seeds, also, afford much food to water-fowl, and to some kinds of fish, particularly carp. Its leaves often float, and its stalks seldom rise, more than a foot or fifteen inches above the surface of the water. It has a stiff branching panicle, with whorled spreading branches, and its seeds are small. When its artificial propagation is attempted, it is more frequently by dropping freshly gathered stems into still waters, or scattering them on the mud, than by sowing the seeds. It is sometimes called WHORL GRASS, and sometimes SWEET WATER GRASS.

CATACOMBS (Gr. *kata*, and *kumbos*, a hollow), subterraneous chambers and passages formed generally in a rock, which is soft and easily excavated, such as *tufa*. C. are to be found in almost every country in which such rocks exist, and, in most cases, probably originated in mere quarries, which afterwards came to be used either as places of sepulture for the dead or as hiding-places for the living. The most celebrated C. in existence, and those which

## CATAFALCO—CATALEPSY.

are generally understood when C. are spoken of, are those on the Via Appia, at a short distance from Rome. To these dreary crypts it is believed that the early Christians were in the habit of retiring, in order to celebrate their new worship, in times of persecution, and in them were buried many of the saints and martyrs of the primitive church. They consist of long narrow galleries, usually about 8 feet high and 5 wide, which twist and turn in all

Interior of one of the Catacombs of Paris.

directions, very much resembling mines. The graves were constructed by hollowing out a portion of the rock, at the side of the gallery, large enough to contain the body. The entrance was then built up with stones, on which usually the letters D. M. (Deo Maximo), or XP, the first two letters of the Greek name of Christ, were inscribed. Other inscriptions and marks, such as the cross, are also found. Though latterly devoted to purposes of Christian interment exclusively, it is believed that the C. were at one time used as burying-places by pagans also. At irregular intervals, these galleries expand into wide and lofty vaulted chambers, in which the service of the church was no doubt celebrated, and which still have the appearance of churches. The original extent of the C. is uncertain, the guides maintaining that they have a length of 20 miles, whereas about 6 only can now be ascertained to exist, and of these, many portions have either fallen in or become dangerous. When Rome was besieged by the Lombards in the 8th c., many of the C. were destroyed, and the popes afterwards caused the remains of many of the saints and martyrs to be removed and buried in the churches. Art found its way into the C. at an early period, and many remains of frescoes are still found in them. The C. at Naples, cut into the Capo di Monte, resemble those at Rome, and evidently were used for the same purposes, being in many parts literally covered with Christian symbols. In one of the large vaulted chambers there are paintings, which have retained a freshness which is wonderful, when the influences of time and the dampness of the situation are taken into account. The palm-tree, as a memorial of Judea, is a prominent object in these pictures. At Palermo and Syracuse there are similar C., the latter being of considerable extent. They are also found in Greece, in Asia Minor, in Syria, Persia, and Egypt. See NECROPOLIS. At Milo, one of the Cyclades, there is a hill which is honey-combed with a labyrinth of tombs running in every direction. In these, bass-reliefs and figures in *terra cotta* have been found, which prove them to be long anterior to the Christian era. In Peru and other parts of South America, C. have been discovered. The C. in Paris

are a species of charnel-houses, into which the contents of such burying-places as were found to be pestilential, and the bodies of some of the victims of 1792, were cast by a decree of the government.

**CATAFALCO** (Ital. a scaffold), or **CATAFALQUE**, a temporary structure of carpentry, intended to represent a tomb or cenotaph, and adorned with sculpture and painting. It was employed in funeral ceremonies. The most magnificent C. ever made, perhaps, was that used at the interment of Michael Angelo, at Florence.

**CATALANI, ANGELICA**, a highly celebrated Italian singer, born at Sinigaglia, in Central Italy, some say in 1780, others in 1784, educated in the convent of St Lucien, near Rome, where, in her seventh year, she displayed such wonderful vocal powers that strangers flocked from all quarters to hear her. She made her first public appearance at Venice, in her 16th year, and experienced a succession of triumphs in every country in Europe for more than 30 years, amassing immense sums of money. The Italian Opera in Paris was twice under her direction; but her husband's interference and extravagance brought her into much trouble. Her large queenly person and fine countenance, the immense volume, range, and flexibility of her voice, her power of sustaining her notes, in contrast with the lightness and facility of her unerring execution, everywhere took her audience by storm. Her expression, although fine, and her whole style, surprised rather than touched the heart. In concert-singing, her great triumphs were in Rhode's Air with variations, and *God Save the King*—which she would call *shave*; and in Oratorios, Luther's Hymn, her delivery of which, especially when her marvellous voice alternated with the trumpet's sound, was so sublimely awful, that the audience were hushed and pale, and some were borne away fainting. The throat from which these wondrous sounds proceeded was physically of such dimensions, that a physician, when called to look into it, declared he could have passed down a penny-loaf! In 1830, Madame C. purchased a villa near Florence, formerly belonging to the Medici family, where she gave free instructions to girls who had a talent for singing, on condition of their taking the name of Catalani. In the spring of 1849, when political disturbances broke out in Tuscany, she repaired with her daughter to Paris, where she died of cholera on the 13th of June.

**CATALAUNIAN PLAIN** (*Campi Catalaunici*), the ancient name of the wide plain surrounding Chalons-sur-Marne, in the old province of Champagne, France, celebrated as the field of battle where the West Goths, and the forces under the Roman general Aëtius, gained a great victory over Attila in 451 A.D. A wild tradition (made the subject of a striking picture by Kaulbach, 'Die Hunnenschlacht, or The Battle of the Huns') tells that three days after the great fight, the ghosts of the fallen myriads appeared on the plain, and renewed the conflict.

**CATALDO, SAN**, a town of Sicily, in the province of Caltanissetta, and 5 miles west of the town of that name. There are productive sulphur-mines in its vicinity. Pop. 9671.

**CATALEPSY** (*katalepsis*, a taking possession of), a state of more or less complete insensibility, with absence of the power of voluntary motion, and statue-like fixity of the body and limbs in the attitude immediately preceding the attack, a like position being also retained, unless altered by force, until the return of consciousness. Such is the abridged description of C., as commonly given in works of authority. The patient is usually in good

times the attack is preceded by disappointment, fear, violent exciting or depressing passions, or even religious emotions, being in such cases only an extreme form of what is otherwise called trance, reverie, or ecstasy (q. v.); on other occasions, the apparent cause is more purely physical, as in some of the hysterical cases, depending on suppressed menstruation. In all cases of cataleptic rigidity and insensibility, it may be presumed that the brain, as the organ of consciousness, is disturbed; but it does not appear that in any considerable proportion there is structural disease. Patients rarely die during the attack, which may, however, be protracted for an indefinite period, and may even endanger life indirectly by the debility consequent on imperfect nourishment. The circulation and respiration are, in most instances, little affected; cases, however, have been recorded in which, in consequence of their failure, the patient has been supposed to be dead. See DEATH, APPARENT. Many of the recorded cases of C. are little worthy of credit, and it has even been doubted whether this curious disease can ever be said to exist except as the result of some degree of deception, or at least voluntary and conscious regulation of the muscles on the part of the person affected. The combination of C. with hysteria, and its frequent association with what are called the higher phenomena of mesmerism (q. v.), are undoubtedly circumstances of great suspicion; but it would certainly be wrong to suppose that all the cases described were fictitious, and not less so to classify them all under the head of pure imposture. Epidemic C. has been described, and in such cases it would appear plain that the principle of imitation, so powerful in producing nervous disease, must have been at work. The remedies of C. are the same as those of the states to which it is so nearly allied, and of which it may be said to form a part. Moral means form a large part of the treatment, as in hysteria. In some cases, it may become necessary to administer food by means of the stomach-pump, and this even for weeks or months. We have seen such a case end in complete recovery.

CA'TALOGUE (Gr. a list). See BIBLIOGRAPHY, BRITISH MUSEUM, LIBRARY, STARS.

CATALONIA (Spanish, *Cataluña*), an old province and principality of Spain, now divided into the provinces of Barcelona, Tarragona, Lerida, and Gerona, the total area being 12,180 miles, and the population (1870) 1,768,408. C. occupies the north-eastern corner of Spain, having France on the north, and the Mediterranean on the east and south-east. It is watered by the Llobregat and the Ter, and by some of the affluents of the Ebro, the last-mentioned river having its embouchure in Catalonia. The coast is rugged, its boldest promontories being Capes Creus and San Sebastian, and its deepest indentations the Bays of Rossas and Tarragona. With the exception of a few low plains of limited extent, the soil of C. is that of a wild mountainous region formed by numerous offsets or terraces of the Pyrenees, one great ridge or series of ridges extending through the centre of the province.

The terraces, sloping abruptly down to the coast, or to the narrow coast plains, are divided by the valley of Llobregat into the lower and the upper Catalonian mountains.

The climate of C., though fog and rain are frequent, and extreme and rapid changes of temperature prevail, is on the whole healthy and favourable to vegetation. Near Barcelona, oranges flourish in the open air; the fields in some parts are bounded

60

of thorn-apple, laurel, myrtle, pomegranate, box, rosemary, &c., extend where the cork has its limits. Northern upper C. has a more severe winter than the south; but everywhere, vineyards and olive-gardens cover the slopes, and cornfields extend in the valleys. Among the other products are hemp, flax, madder, barilla, and saffron. Hazel-nuts, a variety called Barcelona nuts, are extensively grown. Meadow-lands and pastures are comparatively rare, and horned cattle are, therefore, mostly confined to the districts bordering on the Pyrenees; while few horses and mules are kept; but sheep, goats, and swine are bred in considerable numbers. Silk-worms and bees are also reared. The coasts abound with fish, and game is plentiful. The minerals are coal, copper, manganese, zinc, lead, cobalt, salt, sulphur, and many varieties of marble.

C. is the principal manufacturing province of the kingdom—is, in fact, ‘the Lancashire of Spain.’ The inhabitants are neither French nor Spaniards, their language, costume, and habits being quite distinct from those of either; they have also local coins, weights, and measures. In energy, industry, and intelligence, they greatly surpass the rest of the Spaniards.

C., under the name of *Hispania Tarraconensis*, was one of the earliest, and remained among the last of the Roman provinces. It was invaded and captured by the Alans, who were followed by the Goths, hence its name, *Gothalania*, changed into Gothaland or Catalonia. In the 8th c., the Arabs gained possession of the southern part. When Charlemagne, in 788, subjugated Spain as far as the Ebro, C. formed the central portion of the Spanish mark, governed by French counts, having Barcelona as their residence. They soon made themselves independent of France. In 1137, Earl Raymund Berengar, by his marriage, united C. with Aragon; and the marriage of Ferdinand and Isabella (1469) united both with Castile, and so C. became a portion of the Spanish monarchy, but never a very peaceable one. In modern times especially, it has been the scene of all the Carlist insurrections.

CATALYSIS (Gr. dissolution) is a term applied in Chemical Physics to a force supposed to be exerted by one substance upon a second, whereby the latter is subjected to change or decomposition, whilst the former, or acting substance, remains comparatively unaltered, and does not combine with it. The force, indeed, has been ascribed to the mere ‘action of contact.’ Fermentation is an example of this force (see BEER), when one part of yeast acting upon the sugar of the sweet worts, without entering into combination with it, compels 100 parts of sugar to pass into alcohol and carbonic acid. Germination, or the sprouting of grain when placed in the ground, is another example where one part of *diastase* changes 1000 parts of starch into sugar. No plausible theory has been brought forward to account for these changes, or to define what the force of C. is. Liebig has suggested, as an explanation, ‘that a body in the act of combination or decomposition enables another body with which it is in contact to enter into the same state;’ but this view does not explain C., as that force does not act in the majority of cases where changes are proceeding, and, moreover, the acting substance, while changing itself, never throws the body acted upon into the same state of change, but causes it to assume a new series of changes different from those pursued by itself.

CATALYSOTYPE, a name given by its inventor,

process, upon the assumption that light set up a catalytic action (see CATALYSIS) among the ingredients employed. The paper is first washed with very dilute hydrochloric acid, to prevent the formation of yellow patches of insensitiveness, and then treated with syrup of iodide of iron containing a trace of free iodine; it is then partially dried between folds of blotting-paper, and sensitised by brushing over it a solution of nitrate of silver of ten grains to the ounce. Immediate exposure in the camera follows; after which, though no picture be visible at first, if it be allowed to remain in the dark for a period which varies with the length of time it was exposed, and the amount of light, a negative picture of great perfection is gradually developed. It is not necessary, however, for the explanation of this phenomenon, to assume that a catalytic action is set up, inasmuch as the ordinary chemical reactions are quite sufficient to account for it. As soon as *nitrate of silver* comes in contact with the moist *iodide of iron* with which the paper is first imbued, an interchange of elements takes place, *iodide of silver* is precipitated in the pores of the paper, and *protonitrate of iron* is diffused over the surface; and this latter salt is even a more energetic developing agent than the ordinary gallic acid, hence the seemingly spontaneous appearance of the picture. This process is so uncertain in its results, that it is seldom practised.

CATAMARA'N is a raft formed of three planks lashed together, the middle one serving as a keel,

Indian Catamaran.

and the other two for the sides. The rower stands or kneels on the middle plank, and works a paddle. These simple vessels are used by the natives of Madras, to maintain communication between ships and the shore, ordinary boats being rendered unsafe by the surf. By the adoption of a similar construction on a larger scale, some of the catamarans are made large and strong enough to carry goods, and even artillery. Catamarans used in Brazil consist simply of three logs of wood tapered at the end and lashed together; they carry a sail.

CATA'NIA, or CATANEA, a city and seaport of Sicily, situated on the east coast, near the foot of Mount Etna, 31 miles north-north-west of Syracuse. The fertile and well-cultivated neighbourhood of C., extending along the south-east base of Mount Etna, is styled 'the granary of Sicily,' and has given to C. the title, 'La Bella Catania.' By eruptions of the great volcano and attendant earthquakes, the city has been several times almost entirely destroyed—especially in the year 1693; but out of its ruins it has always risen with increased beauty, and it is now the finest city in Sicily, being built throughout on a beautiful and consistent plan, from which no deviation is allowed. The harbour of C., formerly good, was choked by a stream of lava in 1693, and the mole was partly destroyed, so that now it has only a roadstead, which is guarded by a fort, and serves as a landing-place. It has several squares, the finest of which, in front of the cathedral, has a statue of an elephant sculptured in lava. Among

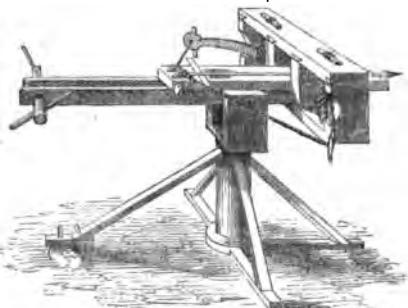

and church of San Nicolo, with one exception, the grandest structure of the kind in Europe; the town-hall; the cathedral, with its noble granite columns; and the university, founded in 1445. It has besides many handsome churches and convents, and several educational and charitable institutions, and is the seat of one of the three high courts in the island. The inhabitants, formerly much more numerous, amounted in 1872 to 84,397, and are distinguished by their commercial spirit and industry. C. has manufactures of silk and linen goods, and of articles in amber, lava, wood, &c. Among the remains of ancient times, that earthquakes have spared, are those of a theatre, an odeum, a temple of Ceres, Roman baths, and an aqueduct. C., anciently known by the name *Calana*, was founded by a Greek colony of Chalcidio origin, in the latter part of the 8th c. B.C.; and as early as the beginning of the 5th c. B.C., it was esteemed one of the most flourishing towns in Sicily. It was taken by the Athenians under Nicias, and was desolated by Dionysius I.; but again rose under the Roman sway into its former importance. Augustus here founded a Roman colony. It suffered at the hands of the Goths, but once more, under the Byzantine empire, became one of the principal cities in the island. C. gives name to the province of which it is the capital, and which is one of the richest in Sicily, with an area of 1743 square miles, and a population, in 1872, of 479,850.—C., GULF OR, an inlet of the Mediterranean, on the east coast of Sicily, extends in the form of a semicircle from La Trezza Bay to Cape Santa Croce, a distance of 18 miles. It is about 10 miles deep, and receives the river Giaretta.

CATANZA'RO, a city of South Italy, in the province of the same name, is beautifully situated on the declivity of a rocky hill, near the Gulf of Squillace, and in the midst of a very fertile district. On account of its agreeable climate, many wealthy families have made it their residence. It has a cathedral, an old castle of the Norman period, a college, one of the largest, as it is one of the best conducted in the country, and is the seat of one of the four great civil courts of the kingdom. C. suffered very severely by an earthquake in 1783. It has manufactures of silk-velvet and woollen fabrics, and an active trade in agricultural produce. Pop. (1872) 24,901.

CA'TAPLASM (a Greek term for a poultice), an application to diseased or painful parts, for the purpose of promoting suppuration, relieving pain, and stimulating or soothing the skin, according to circumstances. A C. may be composed of any moist pulpy substance of sufficient consistency to retain the water without dripping or soaking through the thin muslin covering in which it is generally wrapped. The making of a poultice well is a matter of some nicety, and unless the proper consistency is given to the mass, the application is apt to do more harm than good. The linseed-meal poultice is the most easily made, and most satisfactory of all soothing applications. The meal is stirred gradually into a sufficient quantity of boiling water, placed in the bottom of a small basin or teacup, until a perfectly smooth pulp is formed of the proper consistence, and in quantity sufficient to cover completely, to the thickness of three-quarters of an inch, the whole pained part. The pulp is then folded up in muslin or thin calico, and applied as soon as the heat will permit it to be borne. The bread and milk, or even bread and water poultice, is also very good; as is also the oatmeal-porridge poultice, to which a little butter may be added with advantage. A spoonful

discharges, or peat charcoal may be sprinkled on the surface of the poultice before it is applied. Carrot poultices are in great favour with the people in some parts of the country. Hemlock poultices, made of the fresh leaves, or of the dried leaves, with the aid of some powder of the leaves, form a valuable sedative application in painful diseases; and poppy-heads, or even opium, are sometimes infused in the water of which a poultice is made, for the same purpose. A stimulating C. or poultice may be made by sprinkling oil of turpentine, or chloroform, or mustard in moderate quantity on the surface of any ordinary poultice. When considerable irritation of the skin in a short time is desirable, a mustard C. or sinapis (*sinapi*, mustard) is used.

CATAPULTA, an engine of war used by the ancients, somewhat resembling the crossbow. In the C., a string or rope, suddenly freed from great tension, gave a powerful impulse to an arrow placed in a groove. There were great catapultas, fixed upon a

Catapulta.

scaffold with wheels, which were used in sieges, and small ones, carried in the hand, which were employed in the field. For a description of similar engines of ancient warfare, see articles BALISTA and ARBALEST.

CA'TARACT, an opaque condition of the lens of the eye. It is readily distinguished from opacities of the cornea, or clear front part of the eye, by its position just behind the pupil—that round and varying aperture in the iris through which light is admitted into the back of the eye. C. may affect the lens alone (lenticular C.), or the front or back of the capsule of the lens (capsular C.), or both lens and capsule (capsulo-lenticular C.). Its whiteness varies from that of half-boiled white of egg to that of snow. Heat will produce a like change on the lens out of the body, just as it changes white of egg from transparent to opaque. The rounded lens of the fish is seen at table in this opaque condition.

C. is painless, and unaccompanied by inflammation. It occasions blindness simply by obstructing the passage of the light; but C. alone does not produce so complete blindness but that the patient can tell light from darkness. It may occur at any age, but is most common in elderly persons, and is not unfrequent in children, who may be even born with it. The catoptric test, as it is called, is an ingenious method of distinguishing incipient C. from certain other deep affections of the eye. When a lighted candle is held before the eye of a person whose back is to the window, three candles are seen in the healthy eye. Two are erect—the large front one caused by the convex cornea, the smaller and fainter one behind by the convex front of the lens. The third, occasioned by the concave back of the lens, is in the middle; is small, bright, and turned upside down;

direction, while the window looks directly towards the candle. When the back of the lens becomes opaque, the inverted image is obscured or disappears; and when the front of the lens is affected, only the great front image, caused by the cornea, remains. This curious experiment may be tried on a large scale, by holding a common bi-convex lens a little way behind a watch-glass. Then, on greasing the back of the lens, to imitate C., the inverted image disappears, and on turning the lens round, all but the image in the watch-glass disappears.

No medical or other treatment has any influence in arresting the progress of C., nor can it be cured but by a surgical operation. A clever imposture used to be practised by quacks. By applying belladonna to the eye—as the surgeon does when he wishes to dilate the pupil for an examination or operation—some little light was temporarily admitted through the less opaque edge of the lens. The patient beginning to see somewhat better, after long and increasing dimness of vision, began to congratulate himself on a cure; the quack, of course, hastened to get his money without waiting for the further result, which was sure to be blank disappointment. So long as there is fair vision with one eye, the operation on the other may be delayed. It is a mistake to delay the operation in children on account of their tender age. The sooner it is done the better, both for the eye and the education of the child.

Three methods of operation are practised. 1. For absorption or solution. This is suitable for children, in whom the C., like the natural lens, is soft, and in all other cases in which there is reason to suppose that the C. is soft. An appropriate needle is passed through the cornea; made to open and lacerate the front of the capsule, the rags of which curl out of the way behind the iris, so that their subsequent opacity does not obstruct the light; then the soft cataractous lens is punctured and picked so as more effectually to admit the aqueous humour, which naturally fills the space between the lens and the cornea, and which has the remarkable property of absorbing or dissolving the lens or cataract when admitted within the capsule. This operation may require to be repeated several times, at intervals of a few weeks, before the whole C. is dissolved. 2. Displacement. A needle is passed through the fore part of the white of the eye, until it is seen through the upper part of the pupil, lying across the front of the upper part of the lens. This is now pressed back, so as to make the lens sink down and back into the vitreous humour, when it is either slowly absorbed, or may in part permanently remain. The older method of displacement, termed couching, in which the lens was pushed more directly downwards, is now abandoned, as more likely to press on the retina, and cause subsequent evil to the eye. 3. Extraction. Half the cornea, through nearly its whole breadth, is divided with Beer's knife, an operation requiring great skill; the front of the capsule is opened, and disposed of with a needle; and the lens is gently assisted out of its place, through the pupil, and out of the opening in the cornea, great care being taken not to allow the vitreous humour to follow. Displacement and extraction are both applicable to hard cataracts, the form it generally takes in old age, as the lens itself becomes naturally harder with age, as well as more flat and amber-tinted. Displacement is more likely to be followed by bad consequences, some time after, from the presence of the displaced lens, while the risk of extraction is greater at the operation. The surgeon must decide which is best for each case. Though not so simple and successful

as the operation for absorption through the cornea for soft C., displacement and extraction are generally very successful in restoring vision. The place of the lens is supplied by fluid humour, the refracting power of which is nearly equal to that of the lens, and the restoration of vision may be perfect. All of these operations require minute anatomical knowledge (see EYE), and great nicety and skill in the use of the instruments.

CATA'RRH (Gr. *kalarreo*, I flow down), a disease of great frequency in temperate latitudes, especially in changeable moist climates in the winter season. From its well-known connection with sudden falls of temperature, and other epidemic or atmospheric causes (see INFLUENZA), as also from the chill often experienced at the commencement of the disease, it is popularly called a *cold* —a term, however, perhaps somewhat less definite in its meaning than C., which word is usually restricted to the case of a cold affecting the chest, and attended with discharge of mucus by coughing. A 'cold in the head' is termed, in strict scientific language, *Coryza*; we shall, however, keep both forms in view in the present article. C., or cold, commonly begins with a feeling of chilliness, which may or may not be attributable to external causes. Sometimes this is absent, there being only a sense of languor and indisposition; not unfrequently there is no sensation of an unusual kind, until a stuffing is experienced in the nostrils, or severe headache, or hoarseness with cough, or oppression of the breathing. The regular form of a cold is to attack the nostrils first, and afterwards the air-passages leading to the chest. When it habitually attacks the chest, without running through its ordinary course as indicated above, there is often some special cause of delicacy in the lungs, or some constitutional tendency towards consumption (q. v.). The discharge is in the beginning watery, becoming afterwards more abundant, glairy, and of yellowish colour; the early stages of the disease are attended by considerable irritation of the surfaces affected, and probably no one of the little miseries of life is more prostrating and discouraging for the time than a bad cold in the head. The tendency of C. to attack the chest, and thus to pass into Bronchitis or Pneumonia (q. v.), or to lay the foundation of tubercular disease, constitutes almost its only danger. See CHEST, DISEASES OF.

The treatment of a cold is commonly a simple matter, so far as the particular attack is concerned. Confinement to the house, and, in severe cases, to bed, or to the sofa, for a day or two; a warm hip or foot bath, to remove the chill; light farinaceous diet, and, if the stomach and bowels are at all loaded, a dose or two of some gentle laxative, are commonly sufficient to subdue the disease. Some persons cure their colds by entire abstinence from food, and as much as possible from drink; others by a large opiate, or by a succession of doses of Dover's powder; others by spirit of mindererus and paregoric; some even profess to carry out the popular maxim, 'stuff a cold, and starve a fever,' and maintain, that a good dinner, and a tumbler of whisky, or brandy toddy, are the best specifica. That colds get well under all these methods, needs not be denied; but that any violently perturbative or specific practice assists the cure, or shortens the disease, has yet to be proved; and multiplied experience has shewn, that 'stuffing a cold' is by no means to be commended. In the later stages, however, a more liberal diet than at first, and in some cases even a moderate allowance of stimulants, affords considerable relief from the feeling of depression that remains for a time on the subsidence of a catarrh. The tendency to this disease, when habitual, and whence

not dependent on any requiring special measures by the daily use of exercise in the open air sleeping-apartment; and by clothing, which is comfortably warm, sudden chills, when to be avoided; but a breathed in a workshop predisposing cause of t

CATCHFLY, the common plants of the natural genus *Silene Armeria*, *S. Anglica*—which being clammy, in exudation, on the calyx, &c., often prove fatal to insects.

## CATCHPOLE—CATECHISM.

**See LYCHINS and SILENE.**—The name is sometimes employed by botanists as a sort of popular equivalent to *Silene*.—*Dianosa niuecipula* is also sometimes called the Carolina Catchfly. See **DIONSEA**.

**CATCHPOLE**, a sheriff's officer, or bailiff, is so called in England, probably because he was in use to catch his victim by the pole, or head.

**CATEAU, L.**, or **CATEAU-CAMBRESIS**, a town of France, in the department of Nord, situated on the Selle, 14 miles east-south-east of Cambrai. C. has manufactures of shawls, merinoes, calicoes, and leather; it has also breweries and distilleries. Pop. 9254. It is celebrated as the place where, in 1559, the treaty known as that of Cateau-Cambresis was concluded between Henri II. of France and Philip II. of Spain, by which the former monarch ceded to the latter, Savoy, Corsica, and nearly 200 forte in Italy and the Low Countries.

**CATECHISM**, from a Greek word, *katēchē*, which means to resound, or sound into one's ears; hence to instruct by word of mouth. Persons undergoing instruction in the principles of Christianity were hence called *catechumens* (*katēchoumenos*), and the teacher appointed for this purpose was called a *catechist*. Hence any system of teaching by question and answer is called a Catechism.

Catechisms have long formed one of the principal means employed for popular instruction in the truths and duties of the Christian religion. The composition of the first catechisms was, in all probability, suggested by the ordinary oral instruction of catechumens, and was intended for the help both of teachers and pupils. It appears to have been in the 8th and 9th centuries that the first regular catechisms were compiled, of which that by Kero, a monk of St Gall, and that ascribed to Otfried of Weissenburg, are among the most noted. At later periods, the use of catechisms prevailed chiefly among the opponents of the hierarchy, as among the Waldenses, the Albigenses, the Wickliffites, and, above all, among the Bohemian Brethren. The term C. appears to have been first employed in its present sense among the latter. At an early period in the history of the Reformation, the Reformers began to avail themselves of this method of popular instruction, and their catechisms became important instruments in that great religious movement. In 1520, Luther published his first short catechism. In 1525, Justus Jonas and John Agricola were intrusted with the preparation of a catechism. In 1529, Luther published his Larger and Smaller Catechisms, which found a place among the symbolical books or standards of the Lutheran churches. A number of catechisms were published also by the Swiss Reformers, and by those of England and other countries. The Geneva catechisms, Larger and Smaller, were the work of Calvin. They were published in 1536, were speedily translated into various languages, and became acknowledged standards of the Reformed churches, not only in Switzerland but in the Low Countries, in France, and in Hungary. The Church of Geneva has set aside the authority of these catechisms.—The Zurich C. is received as a standard in the Church of Zurich.—The Heidelberg or Palatinate C. is of greater importance, however, than any other as a standard of the Swiss Reformed churches. It was compiled by the Heidelberg theologians, Caspar Olevian and Zacharias Ursinus, at the request of the Elector Frederic III. of the Palatinate; it was published in 1563, was approved by several synods, and was subjected to a revision by the Synod of Dort.—In the Church of Rome, the Romish or Tridentine C. is of high authority. It was prepared in accordance with the decrees of the Council of

Trent, by Archbishop Leon. Marino, Bishop Agidius Foscarari, and the Portuguese Dominican, Francis Fureiro; revised by Cardinals Borromeo, Sirlet, and Antonian, and sanctioned by Pope Pius V. It was published at Rome in 1566.—The C. of the Orthodox Greek Church was prepared by Peter Mogilas, metropolitan in Kiev, and published in 1642. It received authority as a standard or symbolical book from a synod at Jerusalem in 1672. It is often called the Larger Russian C., to distinguish it from the Smaller C., prepared by order of Peter the Great.—Besides these catechisms, which have a historic interest, or are of importance from their symbolical character, there have appeared at all periods, since the Reformation, many others, both Protestant and Roman Catholic, some doctrinal, some controversial, some devoted to particular subjects, as the sacraments, or to particular purposes, as the preparation of candidates for admission to the Lord's Supper, some adapted to the mental capacity of very young children, &c. The opinion, however, has become prevalent, that doctrinal abstracts are not the best form in which religion can be presented to the young, and the use of catechisms has accordingly been in some measure relinquished in favour of other methods of instruction.

The C. of the Church of England, with which we are most familiar, is the smaller one published in the Book of Common Prayer. It is in two parts: the first contains and explains the Baptismal Covenant, the Creed, the Ten Commandments, and the Lord's Prayer; the second explains the two sacraments, Baptism and the Lord's Supper. It is not known with absolute certainty who was the author of the first part; probably Cranmer and Ridley had the principal hand in framing the questions and answers. It was originally put forth with the 42 Articles in the reign of Edward VI., and condemned as heretical in the reign of Mary. It must not be confounded with Cranmer's C., which was a larger work, differently arranged, and translated chiefly from the German C. used in Nuremberg. This first part of the church C. is spoken of as the *Shorter Catechism*.

There was a *larger* church C. compiled also in the reign of Edward VI., by Ponet, as is supposed, and it corresponds in some degree with the smaller work above described. It was afterwards revised and enlarged by Noel, Dean of St Paul's, and published in 1570; and though never officially promulgated by the church, it has some authority from having been approved by the lower house of Convocation. At the Hampton Court Conference, in the reign of James I., the *Shorter* C. was considered too short, and the larger one of Noel's too long; and accordingly, at the king's suggestion, an addition was made to the former of that explanation of the two sacraments which now forms the second part of the church catechism. This was drawn up by Dr Overall. The whole is a work much esteemed by all sections of the church, as remarkable for its simplicity, truth, and catholicity. It, however, states the baptismal theory in a way that is not very acceptable to the extreme Low Church party. The rubrics in the Common Prayer Book enjoin the teaching of the C. in the church on Sundays and holidays after the 2d lesson at Evening Prayer; and the 59th canon contains a like injunction, imposing penalties on the clergy who neglect this. The custom of catechizing in the church had fallen into almost universal disuse, but in many parishes it has been revived with excellent results.

The Larger and Shorter Catechisms, which, with the Westminster Confession of Faith, constitute the standards or symbolical books of the Presbyterian

churches throughout the British empire and the United States of America, were compiled by the Assembly (q. v.) of Divines at Westminster: the Shorter C. 'to be a directory for catechising such as are of weaker capacity;' the Larger, 'for catechising such as have made some proficiency in the knowledge of the Christian religion.' The Shorter C. was presented to the English House of Commons on 5th November 1647; the Larger on the 14th April 1648; and in July 1648, both received the sanction of the General Assembly of the Church of Scotland—the General Assembly, in the act approving of the Larger C., declaring it to be 'a rich treasure for increasing knowledge among the people of God,' and that 'they bless the Lord that so excellent a catechism has been prepared.' The Shorter C. has, however, been far more generally used for the purpose of instruction than the Larger, which has been generally felt to be too minute in its statements, and too burdensome to the memory to be employed as a catechism. Even the Shorter C. is regarded by many, who substantially adhere to its doctrine, as carrying the statement of dogmatic theology beyond what is proper for elementary instruction, whilst it has been long felt to be unsuitable for the very young and the very ignorant, and its use is now almost always preceded by that of catechisms more adapted to their capacity. Its influence, however, has been very great in forming the religious opinions, and in exercising and training the intellectual faculties, wherever Presbyterianism has prevailed; for it has been, and still is, in almost universal use among Presbyterians speaking the English language, and to a considerable extent among Independents or Congregationalists both in Britain and America. In Holland also, a translation of it has been much used. It is very generally regarded, by those whose doctrinal views are in accordance with it, as an admirable compend of Christian doctrine and duty.—The authorship of the Westminster Assembly's Catechisms has been the subject of much debate, or at least the authorship of the first drafts of them; it being admitted that they were prepared with great care by committees of the Assembly. But the probability appears to be, that their authorship is to be ascribed entirely to these committees; and that, like the Westminster Confession of Faith, they are thus the result of the joint labours of many. From discoveries recently made by Dr M'Crie, it seems probable that at least the plan or scheme of the Shorter C. is to be ascribed to Mr Palmer.

CATECHU, a substance employed both as a colouring matter and medicinally as an astringent. The C. of commerce is obtained chiefly from East Indian trees, such as the C. tree (*Acacia Catechu*), betel-nut, &c.; but the greater part of that which is exported from India is made from the C. tree. It is known in India by the name *Kutt*; and C. is said to be a name compounded of two words signifying *the juice of a tree* (*cate*, a tree, and *chu*, juice). CUTCH is another form of one or other of these names, and is a common commercial name. The heart-wood alone of the tree yields C., which is obtained by cutting it into small chips, and boiling it in water, straining the liquid from time to time, and adding fresh supplies of chips, till the extract is of sufficient consistence to be poured into clay moulds, which are usually of a square shape; or when of the thickness of tar, it is allowed to harden for two days, so that it will not run, and is formed into balls about the size of oranges, which are placed on husks of rice or on leaves, and appear in commerce enveloped in them. The C. manufacturers in Northern India move to different parts of the

country at different seasons, and erect temporary huts in the jungles, where they carry on their operations. The C. tree abounds chiefly in the Bombay and Bengal presidencies; is a small, erect, thorny tree, with a roundish head of (generally) prickly branches. Its sapwood is yellow, the heart-wood dark red. C. is brittle, and can readily be broken into fragments; is soluble in water, and possesses an astringent taste, but no odour. It is a very permanent colour, and is employed in the dyeing of blacks, browns, fawns, drabs, and greens. It contains much tannin, and an acid called Catechuic Acid, which can be isolated in white silky crystals. It is often adulterated with earthy substances, but its ready solubility in water and alcohol should at once shew the presence of such, by leaving them behind in an insoluble state.—The C. of the betel-nut is obtained by boiling first the nuts, and then the extract to a proper consistency. A first boiling of the nuts for some hours is said to yield a black kind of C., called *Kassu*; and a second boiling, after the nuts are dried, a yellowish-brown kind, called *Coury*, which is considered the best, and is sold for the highest price. The former appears in commerce under the name of Colombo C. or Ceylon C. (or Cutch), in the form of circular flat cakes, covered on one side with husks of rice. The latter does not seem to reach Europe.—Gambir (q. v.) may be regarded as a kind of catechu. Kino (q. v.) is sometimes confounded with catechu. *Terra Japonica*, or JAPAN EARTH, is an old name for C., not quite disused, which was given to it on the supposition of its being an earthy substance brought from Japan.

CATECHUMENS (Gr. persons undergoing a course of instruction; see CATECHISM), the appellation given, in the early Christian Church, to those converted Jews and heathens who had not yet received baptism, but were undergoing a course of training and instruction preparatory to it. They had a place assigned them in the congregation, but were not permitted to be present at the dispensation of the Lord's Supper. In the apostolic age, converts appear to have been at once admitted to the sacraments; but afterwards this ceased to be the case, and a period of probation was required. The C. were divided into different classes or grades, according to their proficiency—those of the lowest grade were not permitted to be present during the prayers of the congregation; and those only of the highest, and who had been declared fit to be baptized at the next administration of the ordinance, were permitted to witness the dispensation of the Lord's Supper.—The term C. was afterwards employed to designate young members of the Christian Church who were receiving instruction to prepare them for confirmation or for the Lord's Supper, and it is still often used in this sense.

CATEGORIES. This designation has come down to us from Aristotle. One of the books of his *Organon* or Logical System is so named. The C., or Predicaments, as the schoolmen called them, are to be understood as an attempt at a comprehensive classification of all that exists, for the purposes of logical affirmation, proof, or disproof. The entire universe may be classified in various ways—as into things celestial and terrestrial; into matter and spirit; into organized and unorganized; into minerals, plants, animals, &c. But the classification contemplated under the C. proceeds on the very general properties or attributes that most extensively pervade all existing things, although in unequal degrees. A good example is Quantity, which pertains to everything that we know or can think of. We give the Aristotelian enumeration—the first column is the original Greek; the second,

## CATENARY—CATERPILLAR.

the Latin rendering of the schoolmen; the third, the nearest corresponding English words :

O <i>beria</i> ,	Substantia,	Substance.
I <i>laris</i> ,	Quantitas,	Quantity.
I <i>latus</i> ,	Qualitas,	Quality.
I <i>ncipit</i> , et c.	Relatio,	Relation.
I <i>latus</i> ,	Actio,	Action.
I <i>magistrus</i> ,	Passio,	Passivity.
I <i>locus</i> ,	Ubi,	Position in Space.
I <i>tempus</i> ,	Quando,	Position in Time.
K <i>indus</i> ,	Situs,	Situation.
E <i>xus</i> ,	Habitus,	Possession.

Mr J. S. Mill has the following remarks on the above scheme : ‘The imperfections of this classification are too obvious to require, and its merits are not sufficient to reward, a minute examination. It is a mere catalogue of the distinctions rudely marked out by the language of familiar life, with little or no attempt to penetrate, by philosophical analysis, to the *rationale* even of these common distinctions. Such an analysis, however superficially conducted, would have shewn the enumeration to be both redundant and defective. Some objects are admitted, and others repeated several times under different heads. It is like a division of animals into men, quadrupeds, horses, asses, and ponies. That, for instance, could not be a very comprehensive view of the nature of Relation, which could exclude action, passivity, and local situation from that category. The same observation applies to position in time and position in space; while the distinction between the latter and situation is merely verbal’—*Logic*, book i., chap. iii., § 1. Some writers have endeavoured to save the C. from these objections, by declaring that the fourth, Relation, is to be looked upon as a general head, comprehending the remaining six under it. But there is no evidence that Aristotle had this view in his mind; on the contrary, it appears almost certain that his idea of Relation was too narrow and limited to admit of his giving it so great a comprehension.

Mr Mill gives as the result of his own analysis, the following enumeration and classification of existences or describable things :

1. Feelings, or States of Consciousness ; which are the most comprehensive experience that the human mind can attain to, since even the external world is only known as conceived by our minds.

2. The Minds which experience those feelings.

3. The Bodies, or External Objects, which are supposed to excite all that class of feelings that we denominate Sensations.

4. The Successions and Co-existences, the Likenesses and Unlikenesses, between feelings or states of consciousness. Although those relations are considered by us to subsist between the bodies, or things, external to our minds, we are driven in the last resort to consider them as really subsisting between the states of each one's own individual mind.

Mr Mill shews that all possible Propositions—and it is with the truth or falsehood of Propositions that the science of Logic has chiefly to do—affirm or deny one or other of the following properties or facts : Existence—the most general attribute of all—Co-existence, Sequence or Succession, Causation—a peculiar case of Succession—and Resemblance. It is to arrive at this classification of Propositions, for the purposes of logic, that the foregoing analysis, corresponding to the Aristotelian C., was made. The properties affirmed of any thing or things, or the things of which any properties are affirmed, come under some one or other of the four heads above given.

The C. of Kant, which are sometimes brought into comparison with those of Aristotle, are conceived under a totally different point of view. See

676

Sir W. Hamilton's *Discussions on Philosophy*, 2d edit., p. 26. They refer to certain forms supposed to be inherent in the understanding itself, under which the mind embraces the objects of actual experience. The Kantian philosophy supposes that human knowledge is partly made up of the sensations of outward things—Colour, Sound, Touch, &c.—and partly of intuitions existing in the mind prior to all experience of the actual world. This is the point of difference between the school of Locke—who rejected all innate ideas, conceptions, or forms—and the school of Kant. No such question was raised under the Aristotelian categories. Kant's enumeration of his innate forms is as follows :

1. Quantity, including unity, multitude, totality;
2. Quality, including reality, negation, limitation;
3. Relation, including substance and accident, cause and effect, action and reaction;
4. Modality, which includes possibility, existence, necessity.

These indicate the elements of our knowledge *a priori*; it being the opinion of the author, that such notions, as Causation, Necessity, &c., cannot be obtained from the exercise of our senses and intelligence upon the world of realities, but must have been somehow or other imprinted upon the mind originally.

CATENARY. The C. is the curve formed by a flexible homogeneous cord hanging freely between two points of support, and acted on by no other force than gravity. If the cord is not homogeneous, and the density varies in any regular way, the cord hangs in a curve slightly different in shape from that of the ordinary catenary. The C. possesses several remarkable properties, one of which is, that its centre of gravity (q. v.) is lower than that of any curve of equal perimeter, and with the same fixed points for its extremities. Where the cord is such that the weight of any part of it is proportioned to its horizontal projection, the curve is a parabola (q. v.). The latter curve and the ordinary C. are of importance chiefly in the theory of suspension bridges (q. v.). The properties of the C. will be found fully analysed in all the leading works on mechanics.

CATENIPORA, a genus of fossil lamelliferous corals peculiar to Palaeozoic strata, confined in Britain to the Silurian measures. The genus is easily recognised. The cells are terminal and oval, arranged like a loose network of chains, hence called ‘chain coral.’ Vertical anastomosing lamellae united the cells together, and formed a hemispherical polypidom, sometimes of great size.

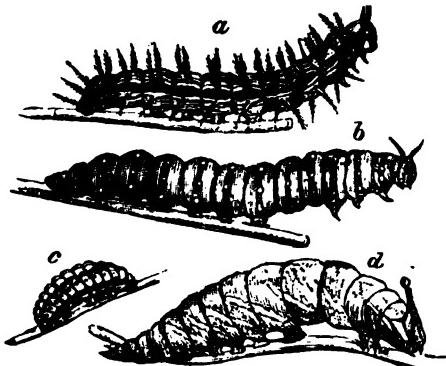

CATERINA, SANTA, a town of Sicily, in the province of Caltanissetta, and 7 miles north-north-west of the town of that name. It is situated on a hill near the river Salso, is fortified, has manufactures of fine earthenware; and in the neighbourhood are found jaspers and agates of good quality. Pop. 5800.

CATERPILLAR, the name given to the larvae of lepidopterous insects—butterflies, moths, and hawk-moths. Caterpillars exhibit as great differences as subsist among the perfect insects into which they change, and the family, genus, and species may be determined by the characters of the C., as well as of the perfect insect. Their body is generally long, nearly cylindrical, soft, and consisting of twelve rings or segments besides the head.

Catenipora escharoidea.

with nine spiracles or small openings for respiration on each side. The head is much harder than the rest of the body, of a sort of almost horny substance, and has six small shining points on each side, which are regarded as simple or *stemmatic* eyes, and is also furnished with two very short rudimentary antennæ. The mouth is adapted for tearing, cutting, and masticating the substances on which the C. is destined to feed, which are very various in the different species, although in all extremely different from the food of the perfect insect: it is provided with two strong *mandibles*, or upper jaws; two *mazilla*, or lower jaws; a *labium*, or lower lip; and four *palpi*, or feelers. In the mouth also is situated the *spinerner* of those species which, when they change into the chrysalis or pupa state, envelop themselves in silken cocoons. See SILK-WORM. The first three segments of the body are each furnished with a pair of feet, which are hard and scaly, and represent the six feet of the perfect insect; some of the remaining segments are also furnished with feet, varying in all from four to ten in number, the last pair situated at the posterior extremity of the body; but these feet are soft and membranous or fleshy, and armed at their extremity with a sort of circlet of minute hooks. All the feet or legs are very short. Those caterpillars in which the *pro-legs*, as they are

Caterpillars of Butterflies:

c, chalk-hill blue; d, purple emperor.

sometimes called, or supplementary soft feet, are pretty equally distributed along the body, move by a sort of regular crawling motion; but those which have only four such feet situated near the posterior extremity, move by alternately taking hold by what may be called their fore-feet and their hind-feet, now stretching the body out to its full length, and now bending it into an arch, whilst the hinder part is brought forward almost into contact with the forepart. Caterpillars which move in this way are called *Geometers* or *Loopers*. Some caterpillars have the power of fixing themselves by the two hind feet to a twig, and stretching themselves out as straight as a rod, so that being in colour very like a twig of the tree on the leaves of which they feed, they are not readily observed. The muscular power required for this position of rest is very great, and Lyonnet found the number of muscles in a C. to be more than 4000. The skin of some caterpillars is naked, that of others is covered with hairs, spines, or tubercles. Some make for themselves nests or tents of silk, under which they dwell in societies, protected from the inclemency of the weather. Many construct cases or sheaths by agglutinating various substances together, as the C. of the common clothes-moth. Some roll together

leaves, and fix them being for themselves; a galleries in the substs leaves; many being l plant, or to a few me on flowers, some on even on the woody wool, hides, furs, and few on lard, and oth admirable harmonious, is the ad kind of C.'s appearanc on which it is to feed.

CATGUT is employed strings of violins, har instruments; as also makers, in the bows. CATHARI, or CAT name very generally given appeared in the church. It appears to have been profession of a purity of to that which generally sometimes bestowed iron profession, and perhaps vation of the Paulicians (q. appellation of sects who in the beginning of the in France and the were some connection with they were sometimes call also *Patarenes* or *Patar or *Popelitans*, and in the The names *Albigenses* a equivalent to one another*

the disadvantage of having to depend entirely on the writings of very bigoted adversaries for our knowledge of their doctrines and practices, and considerable obscurity rests on all this interesting part of ecclesiastical history. Manichaeism, Gnosticism, and Montanism are ascribed to the C.; but there is much reason to think that the errors of a few were often indiscriminately charged upon all, and that such charges indeed sometimes rested on ignorant or wilful misconstruction. It appears quite certain, that the C. differed considerably in their doctrines and in the degree of their opposition to the dominant church. Some of them advocated and practised a rigid asceticism. There is no good evidence that any of them nearly approached to the doctrines of the Reformation; although in their rejection of tradition, of the authority of Rome, of the worship of saints and images, &c., there are notable points of agreement with the views of the Reformers.

CATHARINE is the name of several saints of the Roman Catholic Church. The simple designation of *Saint C.*, however, is given to a virgin, said to have been of royal descent in Alexandria, who, publicly confessing the gospel at a sacrificial feast appointed by the Emperor Maximinus, was put to death in 307 A.D., after being tortured on a wheel. Hence the name of 'St Catharine's wheel.' Very extraordinary legends exist as to her converting 50 philosophers sent by the emperor to convert her in prison, besides a multitude of other persons; the conveyance of her head by the angels to Mount Sinai, &c. She is regarded as the patroness of girls' schools.—*St C. of Siena*, one of the most famous saints of Italy, was the daughter of a dyer in Siena, and was born there in 1347 A.D.; practised extraordinary mortifications; and was said to be favoured with extraordinary tokens of favour by Christ, whose wounds were impressed upon her body, &c. She became a Dominican, and therefore afterwards a patron saint of the Dominicanas. She wrote devotional pieces, letters, and poems, which have been more than once printed: the best edition appeared at Siena and Lucca, in 1707—1713, in 4 vols. 4to, under the title of *Opera della serafica Santa Catarina—St C. of Bologna and St C. of Sweden* are of less note.

CATHARINE I., Empress of Russia, was originally by name Martha Rabe, and was the posthumous daughter of John Rabe, a Swedish quarter-master in Livonia. Her mother died in 1635, when she was but three years old. Left helpless and destitute, a parish-clerk took compassion on her, and supported her, and a Lutheran clergyman in Marienburg afterwards received her into his house as an attendant on his children. In 1701, she married a Swedish dragoon, who next year was called to active service; and Marienburg being taken by the Russians, she became for some time the mistress of General Bauer; and afterwards entering the service of the Princess Menchikoff, she attracted the notice of Peter the Great. In 1703 she went over to the Greek Church, and took the name of Catharina Alaxiewna. After being for some years the emperor's mistress, she was privately married to him in 1711; the marriage was publicly avowed in 1712; she was proclaimed empress in 1718, and was crowned at Moscow in 1724. She bore eight children to the emperor, all of whom died in childhood, except two daughters, Anne and Elizabeth, the latter of whom was afterwards Empress of Russia, and the former married the Duke of Holstein, and was the mother of the Emperor Peter III. When Peter the Great and his army seemed entirely in the power of the Turkish army on the Pruth in 1717, C., who was with

him, sought an interview with the Grand Vizier, and, by employing her jewels to bribe his attendants, succeeded in procuring the deliverance of the Russians. Her conduct on this occasion excited so much admiration and gratitude in the emperor, that he resolved to appoint her his successor. Yet in the end of the year 1724, she became the object of his displeasure and suspicion, on account of an alleged intimacy with a chamberlain, whom he caused to be beheaded. Menchikoff, who had always been attached to her interests, was at this time in disgrace. But she had contrived in a great measure to recover her position, when, on 28th January 1725, Peter the Great died. His death was kept secret as long as possible, that everything might be arranged for her taking possession of the throne; and the Archbishop of Pleskow came forward and declared before the troops and people, that the emperor, on his death-bed, had declared her alone worthy to be his successor. The hostility and hesitation of the nobles were at once overcome, and C. was acknowledged as Empress and sole Ruler of All the Russias. Under Menchikoff's direction, the affairs of government went on well enough for a time; but the empress ere long began to yield to the influence of a number of favourites, addicted herself to drunkenness, and lived such a life as could not fail to hurry her to the grave. She died, however, unexpectedly, 17th May 1727.

CATHARINE II., Empress of Russia, was born at Stettin on 25th April 1729. Her father, the Prince of Anhalt-Zerbst, was a Prussian field-marshal, and governor of Stettin. She received the name of Sophia Augusta; but the Empress Elizabeth of Russia having selected her for the wife of her nephew and intended successor, Peter, she passed from the Lutheran to the Greek Church, and took the name of Catharina Alexiowna. In 1743, her marriage took place. She soon quarrelled with her husband, and each of them lived a life of unrestrained vice. Among his attendants was a Count Soltikow, with whom her intimacy soon became scandalous; and Soltikow was sent on an embassy abroad. But the young Polish count, Stanislaus Poniatowski, almost immediately supplied his place. After the death of the Empress Elizabeth in 1761, Peter III. ascended the Russian throne; but the conjugal difference became continually wider. C. was banished to a separate abode; and the emperor seemed to entertain the design of divorcing her, declaring her only son, Paul, illegitimate, and marrying his mistress, Elizabeth Woronzow. The popular dislike to Peter, however, rapidly increased; and at length, he being dethroned by a conspiracy, C. was made empress. A few days afterwards, Peter was murdered (July 1762). What participation his wife had in his murder, has never been well ascertained.

C. now exerted herself to please the people, and among other things, made a great show of regard for the outward forms of the Greek Church, although her principles were, in reality, those of the infidelity then prevalent among the French philosophers. The government of the country was carried on with great energy; and her reign was remarkable for the rapid increase of the extent and power of Russia. Not long after her accession to the throne, her influence secured the election of her former favourite, Stanislaus Poniatowski, to the throne of Poland. In her own empire, however, discontentment was seriously manifested, the hopes of the disaffected being centred in the young prince Ivan, who was forthwith murdered in the castle of Schlisselburg. From that time, the internal politics of Russia long consisted in great part of court intrigues for the humiliation of one favourite and the exaltation of another. The first partition of Poland in

## CATHARINE DE MEDICI—CATHARINE OF ARAGON.

1772, and the Turkish war which terminated in the peace of Kainardji in 1774, vastly increased the empire. The Turkish war which terminated in the peace of Jassy in 1792, had similar results, and also the war with Sweden, which terminated in 1790. The second and third partitions of Poland, and the incorporation of Courland with Russia, completed the triumphs of C.'s reign. She began a war with Persia, however, and cherished a scheme for the overthrow of the British power in India; but a stroke of apoplexy cut her off on November 9, 1796. She was a woman of great ability; but, utterly devoid of principle, she shrank from no crime; and sensuality and ambition governed all her actions. She was shameless in vice; and always had a paramour, who dwelt in her palace, and might be regarded as filling an acknowledged office of state, with large revenues and determinate privileges. Yet distinguished authors flattered her; and she invited to her court some of the literati and philosophers of France. She was ever ready to commence great undertakings, but most of them were left unfinished; and little was really accomplished in her reign for the improvement of the country, or the progress of civilisation. On a visit to the southern provinces of the empire in 1787, she was gratified by a perpetual display of fictitious wealth and prosperity along the whole route. This imperial progress was also a triumphal procession of her vile favourite Potemkin (q. v.).

**CATHARINE DE MEDICI**, the queen of Henri II. of France, was the daughter of Lorenzo de' Medici, Duke of Urbino, and was born at Florence in 1519. In her fourteenth year, she was brought to France, and married to Henri, the second son of Francis I. The marriage was a part of the political schemes of her uncle, Pope Clement VII., but as he died soon after, she found herself friendless and neglected at the French court. In these circumstances, she conducted herself with a submission which seemed even to indicate a want of proper spirit, but which gained her the favour of the old king, and in some measure also of her husband. It was not till the accession of her eldest son, Francis II., in 1559, that her love of power began to display itself. The Guise at this time possessed a power which seemed dangerous to that of the throne, and C. entered into a secret alliance with the Huguenots to oppose them. On the death of Francis II. in 1560, and accession of Charles IX., the government fell entirely into her hands. Caring little for religion in itself, although she was very prone to superstition, she disliked the Protestants, chiefly because their principles were opposed to the absolute despotism which she desired to maintain. Yet she sought to rally the Protestant leaders around the throne, in order to remove the Guise. This attempt having failed, and the civil war which ensued having ended in the peace of Amboise, highly favourable to the Protestants, she became alarmed at the increase of their power, and entered into a secret treaty with Spain for the extirpation of heretics; and subsequently into a plot with the Guise, in which at first only the murder of the Protestant leaders was contemplated, but which resulted in the fearful massacre of St Bartholomew's Day. This event brought the whole power of the state into the hands of the queen-mother, who boasted of the deed to Roman Catholic governments, and excused it to Protestant ones, for she now managed all the correspondence of the court. About this time she succeeded, by gold and intrigues, in getting her third son, afterwards Henri III., elected to the Polish throne. But her arbitrary and tyrannical administration roused the opposition of a Roman

Catholic party, at the head of whom was her own fourth son, the Duke of Alençon, who allied themselves with the Protestants. It was very generally believed that she was privy to the machinations that led to his death. When, after the death of Charles IX., Henri III. returned from Poland to be king of France, his mother still ruled the court, and had the principal share in all the intrigues, treacheries, and political transactions of that woful period. Having betrayed all who trusted them, she and her son found themselves at last forsaken and abhorred by all. The League and the Guise had no more confidence in them, than had the Protestants and Henri of Navarre. Vexation on this account preyed on the proud heart of the queen-mother in her last days; and amidst the confusion and strife of parties, she died at Blois, on 5th January 1589, unheeded and unlamented. Her ruling passion was ambition, and to this she was ready to sacrifice everything. Her unprincipled policy had almost subverted the French monarchy; her extravagance and luxury exhausted the finances of the country. Her influence was powerful in increasing the demoralisation of the court and of society. She unscrupulously employed beauties of her train to corrupt men from whose power she apprehended danger.

**CATHARINE OF ARAGON**, Queen of England, the first wife of Henry VIII., and fourth daughter of Ferdinand and Isabella, king and queen of Castile and Aragon, was born December 1485. She occupies a prominent place in English history, not for what she herself was, but for what she was the occasion of—the Reformation. Married, when scarcely sixteen, to Arthur, Prince of Wales, son of Henry VII., she was left a widow within a year; and in the course of a few months more a second marriage was projected for her by her father-in-law, with his second son Henry, as yet a boy of only twelve years old. The pope's dispensation enabling such near relatives to marry was obtained in 1503, and the marriage took place in June 1509, immediately after Henry's accession to the crown as Henry VIII. Although Henry was very far from being a model husband, he appears to have treated Queen C., who had borne him several children, with all due respect, until about 1527, when he conceived a passion for Anne Boleyn (q. v.). He now expressed doubts as to the legality of his marriage, and set about obtaining a divorce. Pope Clement VII. would readily have annulled the marriage permitted by his predecessor, had he not feared Queen C.'s powerful nephew, the Emperor Charles V. He, however, granted a commission to Campeggio and Wolsey, to inquire into the validity of the marriage; but before these prelates Queen C. refused to plead, and appealed to the pope. The king craved judgment. The legates cited the queen, and declaring her contumacious when she appeared not, went on with the cause; but the wily Campeggio, anxious only for time for his master when the king expected an answer, protracted the court until a future day. The king consulted the universities of Europe, many of which declared the marriage invalid. The pope now summoned the king to Rome, but Henry haughtily refused to appear either himself, or by deputy, which he maintained would be to sacrifice the prerogatives of his crown; and setting the pope at defiance, married Anne Boleyn. Cranmer, shortly afterwards (1533), declared the first marriage void, and Pope Clement annulled Cranmer's sentence, making the separation from Rome complete. Queen C. did not quit the kingdom, but took up her residence first at Ampthill, in Bedfordshire, and afterwards at Kimbolton Castle, Huntingdonshire, where she led an austere religious life until her decease

## CATHARINE PARR—CATHEDRAL.

in January 1536. Queen C.'s personal character was unimpeachable, and her disposition sweet and gentle.

CATHARINE PARR, the sixth wife of Henry VIII., was the daughter of Sir Thomas Parr, and was born in 1513. Married first to Lord Burgh, and afterwards to Lord Latimer, she, in July 12, 1543, became queen of England by marriage with Henry VIII. She was distinguished for her learning and her knowledge of religious subjects, her discussion of which with the king had well-nigh brought her to the block, like so many of her predecessors. Her tact, however, saved her, and brought rebuke on her enemies; for she made it appear to the king's vanity, that she had only engaged him in discourse about the Reformation, in order to derive profit from his majesty's speech. She persuaded Henry to restore the right of succession to his daughters, and interested herself on behalf of the universities. After Henry's death, she married, 1547, Sir Thomas Seymour, and died the following year, not without suspicion of poison.

CATHARINE'S, SR. COLLEGE, or HALL, Cambridge, was founded by Robert Wodelarke, Pro-vost of King's College, 1473, for a master and three or more fellows. The visitors sent down to the university by Edward VI. ordered that there should be then six fellows, and in future a greater or less number as the revenues permitted. The statutes confirmed in May 1860 provide that there shall be a master and nine fellows. There are twenty-four scholars. Edwyn Sandys, Archbishop of York, Bishop Overall, and Bishop Sherlock, were of this college.

CATHA'RTICS (Gr. *kathairō*, I purify), a name originally for all medicines supposed to purify the system from the matter of disease (*materies morbi*), which was generally presumed by the ancients to exist in all cases of fever and acute disease (see CRIMS), and to require to be separated or thrown off by the different excretions of the body. Ultimately, the term C. became limited in its significance to remedies acting on the bowels, which are popularly called purgatives—a mere translation of the Greek word. The principal C. are aloea, gamboge, colocynth, rhubarb, scammony, jalap, senna, Epsom and other salts, and castor oil. Sulphur and cream of tartar forms a well-known mild laxative; magnesia is also useful in many cases of indigestion with acidity. Croton oil and elaterium belong to a more dangerous class of C., as also does the favourite remedy of the ancients—the black hellebore. The doses and use of the more ordinary remedies of this class are explained in all works on medicine. See CONSTITUTION.

CATHA'RTINE, or BITTER OF SENNA, is the essential principle in senna which possesses laxative or purgative properties. It can be isolated as a yellowish-red uncrySTALLISABLE solid, which is deliquescent, soluble in water and alcohol, insoluble in ether, has a very bitter nauseous taste, a characteristic odour, and possesses great purging powers, accompanied by nausea and griping. Three grains of C. are a full dose.

CATHCART, WILLIAM SHAW, EARL, a British general and diplomatist, son of Baron Cathcart of Cathcart, county of Renfrew, was born September 17, 1765. Having studied at Glasgow, he entered the army, took a prominent part in the American war, and fought with distinction in Flanders and North Germany. In 1801, he was made lieutenant-general, and in 1803, commander-in-chief for Ireland. In 1805, he was engaged on a diplomatic mission to the Czar Alexander. In July 1807, he received the command of the land-forces employed

to co-operate with the fleet in the attack on Copenhagen, and, for his services in this capacity, was made a British peer, with the title of viscount, and received a vote of thanks from both Houses of parliament, January 28, 1808. In 1812, he was sent as ambassador to St Petersburg, accompanied the Czar Alexander in the campaigns of 1813 and 1814, and was present at the congresses of Chatillon and Vienna. He was raised to the rank of earl, June 18, 1814. The latter years of his life were chiefly spent at his country residence, Cartside, near Glasgow, where he died June 17, 1843.—His eldest son, CHARLES MURRAY, EARL CATHCART (formerly known as Lord Greenock), was born 1783; served in Spain and at Waterloo under Wellington; afterwards acted in Canada; and was made a general, and colonel of the 1st Dragoon Guards. He died July 1859.

CATHCART, SIR GEORGE, son of William, Earl Cathcart, was born in London, 1794. Educated at Eton and Edinburgh, he, in 1810, joined the 2d Life Guards, and fought with the grand army in the campaigns of 1812 and 1813; and as aide-de-camp to the Duke of Wellington, was present at Quatre Bras and Waterloo. In 1828, he was made lieutenant-colonel, and served in British America and the West Indies for about eight years; and in 1837 he proved himself an energetic and efficient officer in quelling the outbreak in Canada, where he remained for more than six years. In 1852, having held the appointment of deputy-lieutenant of the Tower for some years, he was made governor of the Cape of Good Hope, with command of the forces, and in this capacity succeeded in bringing to a successful end the harassing Kafir war. He returned to England in time to be sent out to the Crimea as general of division. His bravery here was conspicuous, especially in the battle of Inkermann, where the odds were so terribly against the British forces, and where he was slain. He was buried on the spot where he fell, and which, in his honour, was named Cathcart's Hill. C. was the author of a very valuable work, entitled *Commentaries on the War in Russia and Germany* in 1812 and 1813 (London, 1850).

CATHEDRAL, from a Greek word *cathedra*, signifying a seat. Thus, 'to speak ex cathedra,' is to speak as from a seat of authority. The C. city is the seat of the bishop of the diocese, and his throne is placed in the C. church, which is the parish church of the whole diocese. The diocese was, in fact, anciently called *parochia*, until the application of this name to the smaller portions into which it was divided. A C. town has generally been understood to be entitled to the honours of a city, even although the town be not a borough incorporate; but in the case of Manchester, the claim was disallowed by a court of law. The distinction between C. and collegiate churches consists principally in the see of the bishop being at the former. The governing body of a C. is called the dean and chapter—i.e., the dean and canons who meet for corporate purposes in the chapter-house of the cathedral. The property of the C. vests in this body. They elect the bishop of the diocese on the issue of a *congrē d'élire* from the crown, but as the person to be elected is always named, and they may be compelled by a mandamus to elect that person and no other, the election is merely a form.

The bishop is 'visitor' of the dean and chapter. In England, by the act of 1840, all members of cathedrals, except the dean, are styled canons. Their seat in the C. is called their *stall*. They are no longer called prebends. Canons must reside 3 months in each year. The act allows to the canons of Durham,

## CATHELINEAU—CATHOLIC EMANCIPATION ACT.

Manchester, St Paul's, and Westminster, an income of £1000 per annum; to those of every other C. in England, £500. The bishop was always considered of common right to have the patronage of canonries, but formerly there were exceptions. Now, the appointment to all canonries is vested either in the bishop, or in the crown. Where the bishop is patron, he 'collates,' and the dean and chapter 'induct,' by placing the new canon in a stall in the church. The crown appoints by letters-patent, and the canon is installed without collation. Honorary canons have no emoluments, but rank after the canons. Minor canons, of whom there are from 2 to 6 in each C., perform the daily choral services. The C. service is the usual Church of England service intoned, with an anthem and the Psalms chanted. For the general plan of C. buildings, see CHURCH. The more remarkable cathedrals will be noticed under the names of the towns in which they are situated. In England, the number of cathedrals is 29.

**CATHELINEAU, JACQUES**, general of the army in La Vendée, in the west of France, was born January 5, 1759, in very humble life, at Pin-en-Mauges, in Lower Anjou. Horrified at the atrocities and despotic acts of the Convention, he placed himself in opposition to it, and soon collected around him a body of loyal peasantry, whom he led against and defeated the Republicans in several conflicts. After the victory of Saumur (q. v.), the council of generals appointed him, as having the greatest influence over his countrymen, commander-in-chief. He immediately determined to make an attack upon Nantes, and managed to penetrate into the town, where he was wounded by a musket-ball, and his troops immediately dispersed. He was carried to St Florent, where he died July 11, 1793. He was a man of great simplicity and honesty of character, and his piety was such, that he was called the Saint of Anjou.

**CATHERINE-WHEEL** (see CATHARINE, S<sup>r</sup>) is frequently used as a charge in coats of arms, when it is represented with teeth, thus:

**CATHETER** (Gr. *kathíemi*, to thrust into), was a name applied indifferently to all instruments used for passing along mucous canals. In modern times, however, it has generally been reserved for tubular rods through which fluids or air may pass, and which may give free exit to the accumulated contents of such organs as the urinary bladder. The C. for the latter purpose is a very old surgical instrument. The ancients made theirs of copper, which accumulated verdigris. In the 9th c. silver was substituted by the Arabian surgeons as a cleaner metal, and is still used by all who are not obliged, for economical reasons, to have their catheters made of German silver or pewter. The urinary C. for the male varies in length from 10 to 11 inches; the female C. need not be more than 4 or 5 inches. The form is a matter of indifference, but most surgeons prefer an instrument straight to within the last few inches of its length; the latter should be curved into the segment of a small circle. Others, however, use a double curve, and, indeed, nearly every surgeon has a peculiar fancy in this respect.

Flexible catheters are made of gum elastic, which may be used either alone or supported on a wire. Many other materials have been proposed. Of late years, gutta percha has been used, but owing to some awkward accidents—such as portions often breaking off in the bladder—it has not been generally adopted by surgeons.

**CATHODE.** See ANODE.

**CATHOLIC CHURCH.** The term catholic literally signifies *universal*. The phrase C. C. is therefore equivalent to 'universal church,' and cannot properly be applied to any particular sect or body, such as the Roman, Anglican, Genevan, Reformed Lutheran, or Presbyterian, all of which form merely portions more or less pure of the 'church universal.' It was first employed to distinguish the Christian Church from the Jewish; the latter being restricted to a single nation, whereas the former was intended for the world in general. Afterwards, it served to mark the difference between the orthodox Christian Church and the various sects which sprang from it, such as the Cerinthians, Basilidians, Arians, Macedonians, &c. The name has been retained by the Church of Rome, which was the visible successor of the primitive one; and although Protestant divines have been careful to deny its applicability to a church which they consider buried under the corrupt accretions of centuries, yet the term catholic is still used by the populace of almost every Protestant country as synonymous with Roman Catholic, so that from their minds all conception of the literal meaning of the word has vanished. For an account of the Church of Rome, see art. ROMAN CATHOLIC CHURCH.

**CATHOLIC CREDITOR**, in the law of Scotland, is one whose debt is secured over several or the whole subjects belonging to the debtor—a g., over two or more heritable estates for the same debt. The C. C. is bound so to exercise his right as not unnecessarily to injure the securities of the other creditors. Thus, if he draw his whole debt from one of the subjects, he must assign his security over the others to the postponed creditors.

**CATHOLIC (ROMAN) EMANCIPATION ACT** (10 Geo. IV. c. 7). To render this famous measure intelligible, and still more to convey a conception of its importance to younger readers, it is necessary that we should preface our account of it by a slight sketch of the position of our Roman Catholic fellow-subjects before it was passed. From first to last, the sufferings of the Roman Catholics were the fruit of political tyranny quite as much as of religious rancour or fanaticism, and their release was effected by a change in the political rather than in the religious views or feelings of the dominant party. The first occasion on which even a promise of a different line of policy from that which had been originally adopted was held out to the Roman Catholics of Ireland, was on the termination of the revolutionary war in 1691; and had King William been able to carry out the views which his personal enlightenment and liberality dictated, it is probable that Catholic emancipation would have been hastened by more than a century. But the English parliament, which was intensely anti-Roman Catholic, enacted, on the 22d of October 1691, that Irish members of both Houses should take the oaths of supremacy; and three years later, a set of acts were passed, which placed the Roman Catholics in a worse position than at any previous period of their history. The whole population was disarmed, and the priests banished from the country. But what must have been still more intolerable, was the interference with the private arrangements of their families. All Roman Catholics were prohibited from acting as guardians not only to Protestant, but to Catholic children. At a somewhat later date (1704), it was enacted that if a son chose to turn Protestant, he should be entitled to dispossess his father, and at once to take possession of the family estate. Though Catholics were

## CATHOLIC EMANCIPATION ACT.

not directly declared incapable of holding land, they were deprived of the right of acquiring it by purchase, or even by long lease; and if a Catholic chanced to occupy a place in a line of entail, he was passed over in favour of the next Protestant heir. No office of trust, civil or military, was now open to a Catholic; he was forbidden to vote at elections, to intermarry with a Protestant, or even to dwell in Limerick or Galway, except under certain conditions. But perhaps the most demoralizing provision of all, was that which empowered the son of a Catholic to bring his father into Chancery, to force him to declare on oath the value of his property, and to settle such an allowance on him as the court should determine, not only for the father's life, but the son's.

Amongst the other burdens of this heavy time, may be mentioned the exclusion of Catholics from the profession of the law, and the regulation that if a Protestant lawyer married a Catholic, he should be held to have gone over to her faith: the prohibition against Catholics acting as schoolmasters, under the penalty of being prosecuted as convicts, by which the whole body was virtually excluded from the benefits of education: and the still more summary enactment, that if a priest celebrated marriage between a Protestant and a Catholic, he should be hanged. But as years passed away, the memory of the foul deeds of the Inquisition and the confessional, and of the other enormities of which Roman Catholics had been guilty in their days of power, waxed fainter; milder feelings began to prevail; and when Grattan appeared as the champion of their rights, the field was already in some degree prepared for his labours. Favoured by such influences, of which no one knew better how to avail himself, he succeeded, in 1780, in carrying, in the Irish parliament, the famous resolution, 'that the king's most excellent majesty, and the Lords and Commons of Ireland, are the only competent power to make laws to bind Ireland.' Many of the disqualifying statutes were now repealed, and the claim for complete equality with Englishmen and Protestants, or complete separation from the sister-country, was now formally urged. From this period till the final liberation was achieved, there was no rest. The Irish rebellion of 1798 brought home to the English nation the dangers to which it would constantly be exposed till the question was finally adjusted. The Act of Union of 1800 was the immediate consequence of that outbreak; and to this act the Irish were induced to consent by a virtual pledge entered into by Mr Pitt, to the effect that the Catholic disabilities should be at once removed. But, like William of Orange, Pitt had pledged himself to more than he was able to accomplish. The king was seized with scruples regarding the obligations imposed upon him by his coronation oath, and made a vigorous stand against the proposals of his minister.

At a subsequent period, efforts were made in the direction of emancipation by Mr Canning and Lord Castlereagh. About 1824, the press began to take up the question warmly; a Catholic Association was formed, to prepare petitions to parliament; the Irish priests stimulated their flocks to subscribe for the purposes of agitation; O'Connell rapidly became a power; and as early as March 1825, the importance of the question was so deeply felt, that Sir F. Burdett ventured to introduce a relief bill, which passed the Commons by a majority of 268 to 241, but was rejected by the Lords. A slight temporary reaction now took place, the superstitious fears of ignorant Protestants being excited by a 'no-popery' cry, and in consequence, a new relief bill, introduced in 1827, though supported by the last effort of Canning's eloquence, was lost in the Commons by a majority

of 4. But the liberal view of the Roman Catholic claims was essentially the popular one—at least among the enlightened classes; and as a proof of this, under the hostile administration of the Duke of Wellington, the very same resolution which had been lost in 1827 by a minority of 4, was carried in 1828 by a majority of 6. The duke himself now began to waver in opinion, so that the beginning of the end was manifestly near. During O'Connell's famous canvass for the county of Clare, the duke declared in the House of Lords, 'if the public mind were now suffered to be tranquil, if the agitators of Ireland would only leave the public mind at rest, the people would become more satisfied, and I certainly think it would then be possible to do something.' O'Connell's return for Clare, notwithstanding the existence of the oaths which precluded him from taking his seat in the House, and the events which now followed in quick succession, made it clear that the 'something' of which the duke had spoken must be the passing of the emancipation bill in the ensuing session. The king's speech, which was read on the 5th February of the following year, accordingly contained a recommendation to parliament, to consider whether the civil disabilities of the Catholics could not be removed, 'consistently with the full and permanent security of our establishments in church and state.'

On the 5th March, Mr Peel brought forward the great measure. The majority on the motion in the Commons for going into committee was 188, in a house of 508 members; the debate on the second reading issued in a majority of 180; and the final majority, after the bill had passed through committee, in which not one of the many amendments proposed was carried, was 178 in a House of 462. In the Lords, the debate lasted three nights, the majority being 106 in favour of the second reading of a bill which, nine months before, the same House had refused, by a majority of 45, even to entertain—so rapid and threatening had been the progress of the agitation. On the 13th April 1829, this famous measure became the law of the land. It now only remains that, by mentioning the provisions of the act, we sum up the results of one of the most important controversies that ever agitated the inhabitants of this country. For the oath of supremacy, another oath was substituted, by which all Catholic members of parliament bound themselves to support the existing institutions of the state, and not to injure those of the church (see ABSURATION). Catholics were admitted to all corporate offices, and to an equal enjoyment of all municipal rights. The army and navy had already been opened to them. On the other hand, they were excluded from the offices of Regent of Chancellor of England or Ireland, and of Viceroy of Ireland; from all offices connected with the church, its universities and schools, and from all disposal of church patronage. The most important security related to the franchise, in which a £10 was substituted for a 40s. qualification in Ireland. The clergy of the R. C. Church were left in the position of other dissenters, the government having declined either to endow them, or to introduce any machinery for prying into their relations to the pope. But the public use of their insignia of office, and of episcopal titles and names, was denied them; the extension of monachism was prohibited; and it was enacted that the number of Jesuits should not be increased, and that they should henceforth be subject to registration. For further information, see Miss Martineau's *History of England during the Peace from 1815 to 1846*. W. & R. Chambers, 1858.

**CATHOLIC EPISTLES**, the name given, according to Clemens Alexandrinus and Origen, to certain epistles, addressed not to particular churches or individuals, but either to the church universal or to a large and indefinite circle of readers. Originally, the C. E. comprised only the first epistle of John and the first of Peter, but, at least as early as the 4th c. (as evinced by the testimony of Eusebius), the term was applied to all the apostolic writings used as ‘lessons’ in the orthodox Christian churches. But this included the Epistle of James, of Jude, the 2d of Peter, and the 2d and 3d of John. These seven thus constituted the C. E., although the genuineness and authenticity of the last-mentioned five were not universally acknowledged; but this very incorporation with epistles whose canonicity was not questioned, naturally had the effect of confirming their authority, so that in a short time the entire seven came to be considered a portion of the canon.

**CATHOLICOS**, the title of the patriarchs or chief ecclesiastics in the hierarchy of the Armenian Church, and of the Christians of Georgia and Mingrelia.

**CATILYNA**, Lu'cius Si'rus, descended from a patrician but impoverished family, was born about the year 108 B.C. During his youth, he attached himself to the party of Sulla. His bodily constitution, which was capable of enduring any amount of labour, fatigue, and hardship, allied to a mind which could stoop to every baseness and feared no crime, fitted him to take the lead in the conspiracy which has made his name infamous to all ages. In the year 68 B.C. he was elected prætor; in 67 B.C., governor of Africa; and in 66 B.C., he desired to stand for the consulship, but was disqualified on account of the accusations brought against him of maladministration in his province. Disappointed thus in his ambition, and burdened with many and heavy debts, he saw no hope for himself but in the chances of a political revolution, and therefore entered into a conspiracy, including many other young Roman nobles, in morals and circumstances greatly like himself. The plot, however, was revealed to Cicero by Fulvia, mistress of one of the conspirators. Operations were to commence with the assassination of Cicero in the Campus Martius, but the latter was kept aware of every step of the conspiracy, and contrived to frustrate the whole design. In the night of November 6 (63 B.C.), Catiline assembled his confederates, and explained to them a new plan for assassinating Cicero; for bringing up the Tuscan army (which he had seduced from its allegiance), under Manlius, from the encampment at Fesula; for setting fire to Rome, and putting to death the hostile senators and citizens. In the course of a few hours, everything was made known to Cicero. Accordingly, when the chosen assassins came to the house of the consul, on pretence of a visit, they were immediately repulsed. On the 8th of November, Catiline audaciously appeared in the senate, when Cicero—who had received intelligence that the insurrection had already broken out in Etruria—commenced the celebrated invective beginning: *Quousque tandem abutre, Catilina, patientia nostra?* &c. (‘How long now, Catiline, will you abuse our patience?’) The scoundrel was abashed, not by the keenness of Cicero’s attack, but by the minute knowledge he displayed of the conspiracy. His attempt at a reply was miserable, and was drowned in cries of execration. With curses on his lips, he abruptly left the senate, and escaped from Rome during the night. Catiline and Manlius were now denounced as traitors, and an army under the consul, Antonius, was sent against them. The conspirators who

remained in Rome, the chief of whom was Lentulus, were arrested, tried, condemned, and executed, December 5. The insurrections in several parts of Italy were meanwhile suppressed; many who had resorted to Catiline’s camp in Etruria, deserted when they heard what had taken place in Rome, and his intention to proceed into Gaul was frustrated. In the beginning of January (62), he returned by Pistoria (now Pistoja) into Etruria, where he encountered the forces under Antonius, and, after a desperate battle, in which he displayed almost superhuman courage and enthusiasm, was defeated and slain. The appearance of Catiline was in harmony with his character. He had a daring and reckless look; his face was haggard with a sense of crime; his eyes were wild and bloodshot, and his step unsteady, from nightly debauchery. The history of the Catiline conspiracy is given by Sallust in a remarkably concise and nervous style.

**CATION.** See ANODE.

**CATKIN** (*amentum*), in Botany, a spike of numerous, small, unisexual flowers, destitute of calyx and corolla, and furnished with scale-like bracts instead, the whole inflorescence finally

Catkin of Willow.

Catkin of Birch.

falling off by an articulation in a single piece. Examples are found in the willow, hazel, oak, birch, alder, and other trees and shrubs, forming the natural order AMENTACEÆ (q. v.). In some, as in the oak and hazel, the male flowers only are in catkins.

**CA'TMINT** (*Ne'peta cataria*), a plant of the natural order *Labiatae*, pretty common in England, in chalky and gravelly soils, but rare in Scotland and Ireland, widely diffused throughout Europe and the middle latitudes of Asia, and of North America; remarkable for the fondness which cats display for it. It appears to act upon them in a similar way to Valerian root; and when its leaves are bruised so as to be highly odoriferous, they are at once attracted to it, rub themselves on it, tear at it, and chew it. Its odour has been described as intermediate between that of mint and that of pennyroyal. It has erect stems, 2–3 feet high, dense whorls of many whitish flowers, tinged and spotted with rose-colour, and stalked heart-shaped leaves of a velvety softness, whitish and downy beneath.—Other species are numerous in the south of Europe, and middle latitudes of Asia.

**CATO**, MARCUS PORCIUS, surnamed *Censorius* and *Sapiens* (‘the wise’), afterwards known as *CATO PRISCUS* or *CATO MAJOR*—to distinguish him from Cato of Utica—was born at Tusculum in 234 B.C. He inherited from his plebeian father a small farm in the country of the Sabines, where he busied himself in agricultural operations, and learned to love the simple and severe manners of his Roman forefathers, which still lingered round his rural home. Induced by Lucius Valerius Flaccus to

remove to Rome when that city was in a transition epoch, from the old-fashioned strictness and severe frugality of social habits, to the luxury and licentiousness of Grecian manners, C. appeared to protest against this, to denounce the degeneracy of the Philo-hellenic party, and to set a pattern of sterner and purer character. He soon distinguished himself as a pleader at the bar of justice, and after passing through minor offices, was elected consul. In his province of Nearer Spain, where an insurrection had broken out after the departure of the elder Scipio (206 B.C.), C. was so successful in quelling disturbances and restoring order, that in the following year he was honoured by a triumph. C. exhibited extraordinary military genius in Spain; his stratagems were brilliant, his plans of battle were marked by great skill, and his general movements were rapid, bold, and unexpected. In 187 B.C., a fine opportunity occurred for the display of 'antique Roman' notions. M. Fulvius Nobilior had just returned from Aetolia victorious, and sought the honour of a triumph. C. objected. Fulvius was indulgent to his soldiers, a man of literary taste, &c., and C. charges him, among other enormities, with 'keeping poets in his camp.' These rude prejudices of C. were not acceptable to the senate, and C.'s opposition was fruitless. In 184 B.C., C. was elected censor, and discharged so rigorously the duties of his office, that the epithet *Censorius*, formerly applied to all persons in the same station, was made his permanent surname. Many of his acts were highly commendable. He repaired the water-courses, paved the reservoirs, cleansed the drains, raised the rents paid by the publicans for the farming of the taxes, and diminished the contract prices paid by the state to the undertakers of public works. More questionable reforms were those in regard to the price of slaves, dress, furniture, equipage, &c. His despotism in enforcing his own idea of decency may be illustrated from the fact, that he degraded Manilius, a man of praetorian rank, for having kissed his wife in his daughter's presence in open day. C. was a thoroughly dogmatic moralist, intolerant, stoical, but great, because he manfully contended with rapidly swelling evils; yet not wise, because he opposed the bad and the good in the innovations of his age with equal animosity.

In the year 175 B.C., C. was sent to Carthage to negotiate on the differences between the Carthaginians and the Numidian king Masinissa; but having been offended by the Carthaginians, he returned to Rome, where, even afterwards, he described Carthage as the most formidable rival of the empire, and concluded all his addresses in the senate-house—whatever the immediate subject might be—with the well-known words: '*Ceterum censeo, Carthaginem esse delendam*' ('For the rest, I vote that Carthage must be destroyed').

Though C. was acquainted with the Greek language and its literature, his severe principles led him to denounce the latter as injurious to national morals. He died 149 B.C., at the age of 85. C. was twice married. In his eightieth year, his second wife, Salonia, bore him a son, the grandfather of Cato of Utica. C. treated his slaves with shocking harshness and cruelty. In his old age, he became greedy of gain, yet never once allowed his avarice to interfere with his honesty as a state-functionary. He also composed various literary works, such as *De Re Rustica* (a treatise on agriculture)—much corrupted, however. The best editions are by Gesner and Schneider in their *Scriptores Rei Rusticar.* His greatest historical work, *Origines*, has unfortunately perished; but some few fragments are given in Krause's *Historicorum Romanorum Fragmenta*

(Berlin, 1833). Fragments of C.'s orations—of which as many as 150 were read by Cicero—are given in Meyer's *Oratorum Romanorum Fragmenta* (Zurich, 1842).

CATO, MARCUS PORCIUS, named CATO THE YOUNGER, or CATO UTICKENSIS (from the place of his death), was born 95 B.C. Having lost, during childhood, both parents, he was educated in the house of his uncle M. Livius Drusus, and, even in his boyhood, gave proofs of his decision and strength of character. In the year 72 B.C., he served with distinction in the campaign against Spartacus, but without finding satisfaction in military life, though he proved himself a good soldier. From Macedonia, where he was military tribune in 67, he went to Pergamus in search of the Stoic philosopher, Athenodorus, whom he brought back to his camp, and whom he induced to proceed with him to Rome, where he spent the time partly in philosophical studies, and partly in forensic discussions. Desirous of honestly qualifying himself for the questorship, he commenced to study all the financial questions connected with it. Immediately after his election, he introduced, in spite of violent opposition from those interested, a rigorous reform into the treasury offices. He quitted the questorship at the appointed time amid general applause. In 63 B.C., he was elected tribune, and also delivered his famous speech on the Catiline conspiracy, in which he denounced Caesar as an accomplice of that political desperado, and determined the sentence of the senate. Strongly dreading the influence of unbridled greatness, and not discerning that an imperial genius—like that of Caesar—was the only thing that could remedy the evils of that overgrown monster, the Roman Republic, he commenced a career of what seems to us blind pragmatical opposition to the three most powerful men in Rome—Crassus, Pompey, and Caesar. C. was a noble but strait-laced *theorist*, who lacked the intuition into circumstances which belongs to men like Caesar and Cromwell. His first opposition to Pompey was successful; but his opposition to Caesar's consulate for the year 59 not only failed, but even served to hasten the formation of the first triumvirate between Caesar, Pompey, and Crassus. He was afterwards forced to side with Pompey, who had resiled from his connection with Caesar, and become reconciled to the aristocracy. After the battle of Pharsalia (48 B.C.), C. intended to join Pompey, but hearing the news of his death, escaped into Africa, where he was elected commander by the partisans of Pompey, but resigned the post in favour of Metellus Scipio, and undertook the defence of Utica. Here, when he had tidings of Caesar's decisive victory over Scipio at Thapsus (April 6, 46 B.C.), C., finding that his troops were wholly intimidated, advised the Roman senators and knights to escape from Utica, and make terms with the victor, but prohibited all intercessions in his own favour. He resolved to die rather than surrender, and, after spending the night in reading Plato's *Phaedo*, committed suicide by stabbing himself in the breast.

CATO, DIONYSIUS, is the name prefixed to a little volume of moral precepts in verse, which was a great favourite during the middle ages. Whether or not such a person ever existed, is a point of the greatest uncertainty. The title which the book itself commonly bears, is *Dionysii Catonis Disticha de Moribus ad Filium*. Its contents have been differently estimated: some scholars have considered the precepts admirable; others, weak and vapid: some have found indications of a superior scriptural knowledge; others, of a deep-rooted

paganism. The style has been pronounced the purest Latin and the most corrupt jargon. The truth would seem to be, that on a groundwork of excellent Latin of the Silver Age, the illiterate monks of a later period have, as it were, inwoven a multitude of their own barbaric errors, which preclude us from determining precisely the period when the volume was composed. It begins with a preface addressed by the supposed author to his son, after which come 56 injunctions of rather a simple character, such as *parentem ama*. This is followed by the substance and main portion of the book—viz., 144 moral precepts, each of which is expressed in two dactylic hexameters. During the middle ages, the *Disticha* was used as a text-book for young scholars. In the 15th c., more than 30 editions were printed. The best edition, however, is that published at Amsterdam in 1754 by Otto Arntzenius. Caxton translated it into English.

CA'TODON and CATODO'NTIDÆ. See CACHOLOT.

CATO'PTRICS. The divisions of the science of optics are laid out and explained in the article OPTICS (q. v.). C. is that subdivision of geometrical optics which treats of the phenomena of light incident upon the surfaces of bodies, and reflected therefrom. All bodies reflect more or less light, even those through which it is most readily transmissible; light falling on such media, for instance, at a certain angle, is totally reflected. Rough surfaces scatter or disperse (see DISPERSION OF LIGHT) a large portion of what falls on them, through which it is that their peculiarities of figure, colour, &c., are seen by eyes in a variety of positions; they are not said to reflect light, but there is no doubt they do, though in such a way, owing to their inequalities, as never to present the proper phenomena of reflection. The surfaces with which C., accordingly, deals, are the smooth and polished. It tracks the course of rays and pencils of light after reflection from such surfaces, and determines the positions, and traces the forms, of images of objects as seen in mirrors of different kinds.

A ray of light is the smallest conceivable portion of a stream of light, and is represented by the line of its path, which is always a straight line. A pencil of light is an assemblage of rays constituting either a cylindrical or conical stream. A stream of light is called a converging pencil when the rays converge to the vertex of the cone, called a focus; and a diverging pencil, when they diverge from the vertex. The axis of the cone in each case is called the axis of the pencil. When the stream consists of parallel rays, the pencil is called cylindrical, and the axis of the cylinder is the axis of the pencil. In nature, all pencils of light are primarily diverging—every point of a luminous body throwing off light in a conical stream; converging rays, however, are continually produced in optical instruments, and when light diverges from a very distant body, such as a fixed star, the rays from it falling on any small body, such as a reflector in a telescope, may, without error, be regarded as forming a cylindrical pencil. When a ray falls upon any surface, the angle which it makes with the normal to the surface at the point of incidence is called the angle of incidence; and that which the reflected ray makes with the normal, is called the angle of reflection.

Two facts of observation form the groundwork of catoptrics. They are expressed in what are called the laws of reflection of light: 1. In the reflection of light, the incident ray, the normal to the surface at the point of incidence, and the reflected ray, lie all in one plane. 2. The angle of reflection is equal to the angle of incidence. These

laws are simple facts of observation and experiment, and they are easily verified experimentally. Rays of all colours and qualities follow these laws, so that white light, after reflection, remains undecomposed. The laws, too, hold, whatever be the nature, geometrically, of the surface. If the surface be a plane, the normal is the perpendicular to the plane at the point of incidence; if it be curved, then the normal is the perpendicular to the tangent plane at that point. From these laws and geometrical considerations may be deduced all the propositions of catoptrics. In the present work, only those can be noticed whose truth can in a manner be exhibited to the eye, without any rigid mathematical proof. They are arranged under the heads *Plane Surfaces* and *Curve Surfaces*.

*Plane Surfaces*.—1. When a pencil of parallel rays falls upon a plane mirror, the reflected pencil consists of parallel rays. A glance at the annexed figure (fig. 1), where PA and QB are two of the incident rays, and are reflected in the directions AR and BS respectively, will make the truth of this pretty clear to the eye. The proposition, however, may be rigidly demonstrated by aid of Euclid, book xi., with which, however, we shall not presume the reader to be acquainted. The reader may satisfy himself of its truth practically by taking a number of rods parallel to one another and inclined to the floor, and then turning them over till they shall again be equally inclined to the floor, when he will again find them all parallel.—2. If a diverging or converging pencil is incident on a plane mirror, the focus of the reflected pencil is situated on the opposite side of the mirror to that of the incident pencil, and at an equal distance from it. Suppose the pencil to be diverging from the focus Q (fig. 2), on the mirror of the surface of which CB is a section. Draw QN<sub>q</sub> perpendicular to CB, and make qN = QN, then q is the focus of the reflected rays. For let QA, QB, QC be any of the incident rays in the plane of the figure; draw the line AM perpendicular to CB, and draw AR, making the angle MAR equal to the angle of incidence, MAQ. Then AR is the reflected ray. Join qA. Now it can be proved geometrically, and indeed is apparent at a glance, that qA and AR are in the same straight line; in other words, the reflected ray AR proceeds as if from q.

In the same way, it may be shewn that the direction of any other reflected ray, as BS, is as if it proceeded from q; in other words, q is the focus of reflected rays; it is, however, only their virtual focus. See art. FOCUS. If a pencil of rays converged to q, it is evident that they would be reflected to Q as their real focus, so that a separate proof for the case of a converging pencil is unnecessary. The reader who has followed the above, will have no difficulty in understanding

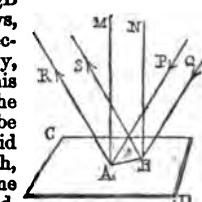

Fig. 1.

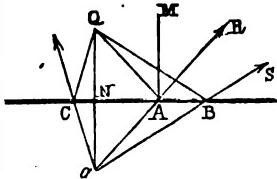

Fig. 2.

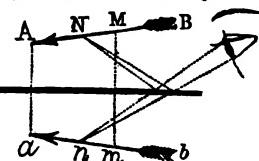

Fig. 3.

how the position and form of the image of an object placed before a plane mirror—as in fig. 3, where the object is the arrow AB, in the plane of the paper, to which the plane of the mirror is perpendicular—should be of the same form and magnitude as the object (as ab in the fig.), and at an equal distance from the mirror, on the opposite side of it, but with its different parts inverted with regard to a given direction. The highest point a, for instance, in the image, corresponds with the lowest point, A, in the object. He will also understand how, in the ordinary use of a looking-glass, the right hand of the image corresponds to the left hand of the object.

When two plane mirrors are placed with their reflecting surfaces towards each other, and parallel, they form the experiment called the Endless Gallery. Let (in fig. 4) the arrow, Q, be placed

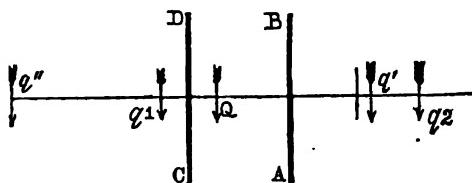

Fig. 4.

vertically between the parallel mirrors, CD, BA, with their silvered faces turned to one another, Q will produce in the mirror CD the image  $q'$ . This image will act as a new object to produce with the mirror BA the image  $q''$ , which, again, will produce with the mirror CD another image, and so on. Another series of images, such as  $q'$ ,  $q''$ , &c., will similarly be produced at the same time, the first of the series being  $q'$ , the image of Q in the mirror BA. By an eye placed between the mirrors, the succession of images will be seen as described; and if the mirrors were perfectly plane and parallel, and reflected all the light incident on them, the number of the images of both series would be infinite. If, instead of being parallel, the mirrors are inclined at an angle, the form and position of the image of an object may be found in precisely the same way as in the former case, the image formed with the first mirror being regarded as a new (virtual) object, whose image, with regard to the second, has to be determined. For a curious application of two plane mirrors meeting and inclined at an angle an aliquot part of  $180^\circ$ , see art. KALMIDOSCOPE—3. The two propositions already established are of extensive application, as has partly been shewn. They include the explanation

of all phenomena of light related to plane mirrors. The third proposition is one also of considerable utility, though not fundamental. It is: When a ray of light has been reflected at each of two mirrors inclined at a given angle to each other, in a plane perpendicular to their intersection, there reflected ray will deviate from its original course by an angle double the

angle of inclination of the mirrors. Let A and B (fig. 5) be sections of the mirrors in a plane perpendicular to their intersection, and let their directions

be produced till they meet in C. Let SA, in the plane of A and B, be the ray incident on the first mirror at A, and let AB be the line in which it is thence reflected to B. After reflection at B, it will pass in the line BD, meeting SA, its original path, produced in D. The angle ADB evidently measures its deviation from its original course, and this angle is readily shewn to be double of the angle at C, which is that of the inclination of the mirrors. It is on this proposition that the important mathematical instruments called the Quadrant and Sextant (q. v.) depend.

*Curved Surfaces.*—As when a pencil of light is reflected by a curved mirror, each ray follows the ordinary law of reflection, in every case in which we can draw the normals for the different points of the surface, we can determine the direction in which the various rays of the pencil are reflected, as in the case of plane mirrors. It so happens that normals can be easily drawn only in the case of the sphere, and of a few ‘surfaces of revolution,’ as they are called. These are the paraboloid, the ellipsoid, and the hyperboloid of revolution. The paraboloid of revolution is of importance in optics, as it is used in some specula for telescopes. See arts. SPECULUM and TELESCOPE. The three surfaces last named are, however, all of them interesting, as being for pencils of light incident in certain ways what are called surfaces of accurate reflection—i.e., they reflect all the rays of the incident pencil to a single point or focus. We shall explain to what this property is owing in the case of the parabolic reflector, and state generally the facts regarding the other two.

1. The concave parabolic reflector is a surface of accurate reflection for pencils of rays parallel to the axis or central line of figure of the paraboloid. This results from the property of the surface, that the normal at any point of it passes through the axis, and bisects the angle between a line through that point, parallel to the axis, and a line joining the point to the focus of the generating parabola. Referring to fig. 6, suppose a ray incident on the surface at P, in the line SP, parallel to the axis AFG. Then if F be the focus of the generating parabola, join PF. PF is the direction of the reflected ray. For PG, the normal at P, by the property of the surface, bisects the angle FPS, and therefore  $\angle(FPG) = \angle(GPS)$ . But  $SPG$  is the angle of incidence, and  $SP$ ,  $PG$ , and  $FP$  are in one plane, and therefore, by the laws of reflection,  $FP$  is the

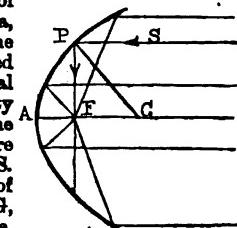

Fig. 6.

reflected ray. In the same way, all rays whatever, parallel to the axis, must pass through F after reflection. If F were a luminous point, the rays from it, after reflection on the mirror, would all proceed in a cylindrical pencil parallel to the axis. This reflector, with a bright light in its focus, is accordingly of common use in light-houses.

2. In the concave ellipsoid mirror there are two points—viz., the foci of the generating ellipse, such that rays diverging from either will be accurately reflected to the other. This results from the property of the figure, that the normal at any point bisects the angle included between lines drawn to that point from the foci.

3. Owing to a property of the surface similar to that of the ellipsoid, a pencil of rays converging to the exterior focus of a hyperbolic reflector, will be accurately reflected to the focus of the generating hyperbola.

## CATOPTROMANCY—CAT'S-EYE.

The converse of the above three propositions holds in the case of the mirrors being convex.

Though the sphere is not a surface of accurate reflection, except for rays diverging from the centre, and which on reflection are returned thereto, the spherical reflector is of great practical importance, because it can be made with greater facility and at less expense than the parabolic reflector. See art. TELESCOPE. It is necessary, then, to investigate the phenomena of light reflected from it.

*4. Spherical Mirrors.*—It is usual to treat of two cases, the one the more frequent in practice, the other the more general and comprehensive in theory. First, then, to find the focus of reflected rays when a small pencil of parallel rays is incident directly

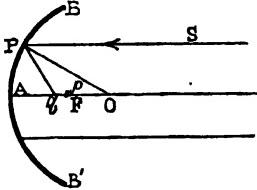

Fig. 7.

on a concave spherical mirror. Let  $BAB'$  (fig. 7) be a section of the mirror,  $O$  its centre of curvature, and  $A$  the centre of its aperture.  $AO$  is the axis of the mirror, and therefore of the incident pencil, because it is incident directly on the mirror; a pencil being called oblique when its axis is at an angle to the axis of the mirror. As the ray incident in the line  $OA$  will be reflected back in the same line— $OA$  being the normal at  $A$ —the focus of reflected rays must be in  $OA$ . Let  $SP$  be one of the rays; it will be reflected so that  $\angle qPO = \angle SPO$ . But  $\angle POq = \angle OPS$  by parallel lines. Therefore,  $\angle qPO = \angle qOP$ , and  $Pq$  and  $Oq$  are equal. If, now, the incident pencil be very small—i. e., if  $P$  be very near  $A$ —then the line  $Pq$  will very nearly coincide with the line  $OA$ , and  $Pq$  and  $Oq$  will each of them become very nearly the half of  $OA$ . Let  $F$  be the middle point of  $OA$ —the point, namely, to which  $q$  tends as the pencil diminishes. Then  $F$  is called the principal focus of the mirror, and  $AF$  the principal focal length, which is thus  $= \frac{1}{2}$  radius of the mirror. It will be observed that when  $AP$  is not small,  $q$  lies between  $A$  and  $F$ .  $Fq$  is called the aberration of the ray. When  $AP$  is large, the reflected rays will continually intersect, and form a luminous curve with a cusp at  $F$ . This curve is called the Caustic (q. v.). We shall now proceed to the more general case of a small pencil of diverging rays, incident directly on a concave spherical mirror. Let  $PAP'$  (fig. 8) be a section of the mirror,  $A$  the centre of its aperture,  $O$  of its curvature, and let  $F$  be its principal focus. Then,

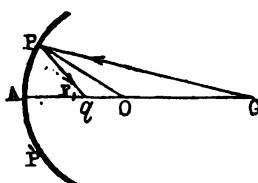

Fig. 8.

if  $Q$  be the focus of incident rays (as if proceeding from a candle there situated),  $q$ , the focus of the reflected rays, lies on the ray  $QOA$ , being incident in the line of the normal  $OA$ , is reflected back in the same line. Let  $PQ$  be any other ray of the pencil. It will be reflected in  $Pq$ , so that  $\angle qPO = \angle OPQ$ ; and on the supposition that  $PA$  is very small, so that  $QP$  becomes nearly equal to  $QA$ , and  $qP = qA$ , it can be shewn, by Euclid, vi. 3, that  $\frac{QO}{QA} = \frac{qO}{qA}$  very nearly.

From this equation is deduced the formula  $qA = \frac{QA \times AF}{QA - AF}$ , which enables us to find  $qA$ , when  $QA$  and  $AF$  are known. Thus, let the radius of curvature

be 12 inches, and the distance of the source of the rays, or  $QA$ , 30 inches, the focal length  $qA = \frac{30 \times 6}{30 - 6} = 7\frac{1}{2}$  inches. If the rays had diverged from  $q$ , it is clear they would have been reflected to  $Q$ . The points  $Q$  and  $q$ , accordingly, are called conjugate foci.

If the mirror be convex, as in fig. 9, instead of concave, and a pencil of diverging rays be incident directly on it from  $Q$ , we should find, proceeding in exactly the same way as in the former case, the equation

$$qA = \frac{QA \times AF}{QA + AF}; \text{ or } \frac{30 \times 6}{30 + 6} = 5 \text{ inches.}$$

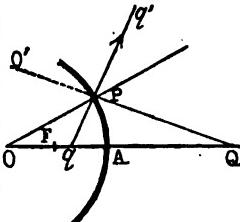

Fig. 9.

For information regarding the formation of images by spherical mirrors, the reader may consult Potter's *Elements of Optics*. See also the arts. MIRRORS and IMAGERS.

By considering fig. 8, it is easy to see how the relative positions of the two conjugate foci, as they are called,  $Q$ , and  $q$ , vary as the distance,  $QA$ , of the origin of the rays is changed. As  $Q$  is advanced towards  $O$ ,  $q$  also approaches  $O$ , since the angles  $QPO$  and  $qPO$  always remain equal; and when the source of the light is in the centre,  $O$ , of the sphere, the reflected rays are all returned upon the source. As  $Q$ , again, recedes from  $O$ ,  $q$  moves towards  $F$ , which it does not quite reach until the distance of  $Q$  is infinite, so that the incident rays may be considered as parallel, as in fig. 7. If  $Q$  is placed between  $O$  and  $F$ , then  $q$  will be to the right of  $O$ ; and when  $Q$  coincides with  $F$ , the reflected rays will have no focus, but will be parallel. If  $Q$  is between  $F$  and  $A$ , the reflected rays will diverge, and will have their virtual focus to the left of  $A$ . The correctness of these deductions may easily be verified. The positions of the conjugates are traced in precisely the same way for the convex mirror, and the reader who is interested will find no difficulty in tracing them for himself.

**CATOPTROMANCY**, divination by the mirror or looking-glass. At Patras, in Greece, the sick foretold their death or recovery by means of a mirror let down with a thread until its base touched the water in a fountain before the temple of Ceres. The face of the sick person appearing healthy in the mirror, betokened recovery; if it looked ghastly, then death was sure to ensue. More modern superstitions attach ill-luck to the breaking of a looking-glass, and to seeing one's face in a glass by candle-light.

**CATS, JACOB**, a Dutch statesman and poet, was born at Brouwershaven, in Zeeland, in 1577, and after studying law, finally settled at Middelburg. He rose to high offices in the state, and was twice sent as ambassador to England, first in 1627, and again in 1632, while Cromwell was at the head of affairs. He died 1660. As a poet, he enjoyed the highest popularity. His poems are characterised by simplicity, rich fancy, clearness, and purity of style, and excellent moral tendency. The most highly prized of his productions were *Huwelyk*, *Trouwslagh* (a series of romantic stories relating to remarkable marriages), and *Spiegel van den Ouden en Nieuwen Tyjd*. The best edition of his works appeared at Amsterdam, in 19 vols., 1790–1800.

**CAT'S-EYE**, a beautiful mineral, a variety of

## CATSKILL MOUNTAINS—CAUB.

quartz receiving its name from the resemblance which the reflection of light from it, especially when cut *en cabochon*, or in a convex form, is supposed to exhibit to the light which seems to emanate from the interior of the eye of a cat. It has a sort of pearly appearance, and is *chatoyant* or characterised by a fine play of light, which results from the parallel arrangement of the minute fibres of the stone itself, or from an intimate mixture of some foreign substance, such as amianthus. It has been supposed that C. is silicified wood. It is of various colours, and is obtained chiefly from Malabar and Ceylon. The Singhalese are especially proud of it, believing it, although erroneously, to be only found in their island. It is often brought from that island, cut to resemble a monkey's face, from the idolatrous regard entertained for the monkey. A chatoyant variety of felspar has been sometimes confounded with C., and is also found in Ceylon.

CATSKILL MOUNTAINS, a group of the Alleghany chain, in its largest sense, situated near the right bank at once of the Hudson and of the Mohawk, in the state of New York. The loftiest points, Round Top and High Peak, are respectively 3800 feet and 3720 above tide-water; and, on a third eminence, a terrace of 2500 feet above the same level presents Catskill Mountain House, a favourite retreat in summer. The group is drained chiefly by Catskill Creek, which, at a village of its own name, enters the Hudson 111 miles above its mouth, and 34 below the confluence of the Mohawk.

CAT'S-TAIL. See TYPHA.

CAT'S-TAIL GRASS. See TIMOTHY GRASS.

CATTARO, a town of Austria, in the crown-land of Dalmatia, is situated at the head of the Gulf of Cattaro, about 36 miles south-east of Ragusa. It is strongly fortified, and surrounded on all sides by mountains. The castle, a massive and almost inaccessible building, stands on a precipitous rock immediately behind the town. C. has a cathedral, several churches and hospitals, and a population of 4000. C., which was at one time the capital of a small republic, was in 1807 annexed to the kingdom of Italy, but was handed over to Austria in 1814 by the treaty of Vienna.—CATTARO, GULF OF, or BOCCA DI CATTARO, an inlet of the Adriatic, near the south extremity of the Dalmatian coast. It consists of three basins or lakes, connected by straits of about half a mile in breadth. The outer entrance is only a mile and a half wide, and the total length of the gulf is about 30 miles. Mountains protect it from all winds, and it has a depth of from 15 to 20 fathoms.

CA'TTEGAT, or KATTEGAT (*Sinus Codanus*), the bay or arm of the sea situated between the east coast of Jutland and the west coast of Sweden, to the north of the Danish islands. It is connected with the Baltic Sea by the Great and Little Belt (q. v.), and by the Sound. The Skager Rack (q. v.) connects it with the North Sea. The length of the C. is about 150 miles, and its greatest breadth 85 miles. It is of unequal depth, and has dangerous sand-banks. The principal islands are Læsø, Samsøe, and Anhalt. The Danish shores of the C. are low, but the Swedish shore is very steep and rocky.

CA'TTERMOLE, GEORGE, one of the most distinguished of English painters in water-colours, was born at Dickleburgh, Norfolk, in 1800. His pictures, which embrace a wide range of subjects, are remarkable for their striking originality of conception, vigorous execution, and fine colour and tone. One of his best known and greatest pictures is 'Luther at the Diet of Spires,' containing 33 portraits of the principal characters, copied from the

authentic originals by the old masters. He also designed the engravings for his brother's *History of the Civil Wars*, and illustrated many scenes in Scott's novels and in Shakespeare. His later works are chiefly oil-paintings. He died July 24, 1868.

CA'TTI, or CHATTI, a German people, included by Caesar under the name Suevi (q. v.), who inhabited a country pretty nearly corresponding to the present Hesse. The south-western part of their territory, around *Mattiacum*, was conquered by the Romans under Drusus. The C. took part in the general rising of the Germans under Hermann. Tacitus praises them as excellent foot-soldiers. During the reign of Marcus Aurelius, in the end of the 2d c., they made incursions into Roman Germany and Rhaetia. Caracalla failed in an expedition against them and the Alemanni in the 3d century. About the middle of that century, their name began to give place to that of the Franks (q. v.), and is last mentioned by Claudian in the latter part of the 4th century.

CATTLE. See OX.

CATTLE, in English Law. See CHATELS.

CATTO'LICA, a town of Sicily, in the province of Girgenti, and 14 miles north-west of the city of that name. It has extensive sulphur-works, and a population of 7200.

CATU'LLUS, VALERIUS, a celebrated Roman lyryst, was born at Verona, 87 B.C. His father was an intimate friend of Julius Caesar, and the young poet must have frequently met the great warrior at the paternal residence, when the latter was on his way to Gaul. In early life, he went to Rome, where his career was that of an Epicurean, and the expense of this kind of living soon involved him in pecuniary difficulties. To release himself from these, he followed the prætor Memmius to Bithynia, with the intention, like his superior, of wringing a fortune out of the provincials. This fashionable but felonious method of acquiring money did not succeed in C.'s case, mainly, however, through the more dexterous cupidity of Memmius. After his return, C. appears to have lived mostly in Rome, and in very straitened circumstances. When he died is unknown. His poems, 116 in number, chiefly consisting of lyrics and epigrams—first brought to light by Benvenuto Campesani of Verona in the beginning of the 14th c.—have always been justly admired for their exquisite grace and beauty of style; but are, in many places, grossly indecent. In higher styles of writing, C. was equally successful, especially in his odes, of which, unfortunately, only four have been preserved. His heroic or narrative poem on the marriage of Peleus and Thetis—consisting of more than 400 hexameter lines—and the wild enthusiastic poem entitled *Atys*, are especially worthy of notice. Most of the earlier editions of C. include the works of Tibullus and Propertius. The best modern editions are by Sillig (Gött. 1823), Lachmann (Berl. 1829), and Döring (Altona, 1834). A very good translation into English was executed by the Hon. George Lamb (Lond. 1821).

CAUB, a town of Nassau, North Germany, on the right bank of the Rhine, 21 miles west-north-west of Wiesbaden. It is noteworthy as the place where Blücher crossed the Rhine with his army, Jan. 1, 1814; and also as the place where, till 1866, toll was levied by the Duke of Nassau—the only ruler who kept up this feudal privilege—from vessels navigating the Rhine. C. has underground slate-quarries; and opposite, on an island in the river, where Louis le Débonnaire died, 840, is a castle called the Pfalz, built in 1326, and which is said to

have been resorted to for safety by the Countesses Palatine during their confinement. Pop. 1500.

**CAUCA**, a river of New Granada, in South America, which, after flowing 500 miles to the north-east, and watering Popayan, Antioquia, and Caceres, joins the Magdalena on the left or west, 160 miles from the Caribbean Sea. It gives name to a generally fertile department of 63,300 square miles, and 200,000 inhabitants.

**CAUCASIAN VARIETY OF MANKIND**, an ethnological division adopted by Blumenbach, which included all the inhabitants, ancient and modern, of Europe (except the Fins); in Asia, the Hindus (of high class at least), Persians, Assyrians, Arabians, Jews, Phoenicians, inhabitants of Asia Minor and of the Caucasus, &c.; and in Africa, the Egyptians, Abyssinians, and Moors. What Blumenbach had called Caucasians, Dr Prichard, who may be said to have laid the real foundation of ethnology, makes to consist of two independent groups or varieties, grounding on a radical difference of language. One of these is the Syro-Arabian or Semitic (q. v.) race, and the other the Indo-European or Aryan (q. v.) race. The inhabitants of the Caucasus, so long held to be types of the European variety, are now by some excluded from it altogether, and classed with the shallow flat-faced Mongols, to which it is considered the nature of their language and other facts ally them more closely than the symmetry of their shape and complexion do to the European variety. The narrow basis upon which the theory of the Caucasian type was first formed is thus stated by Dr Latham: 'Blumenbach had a solitary Georgian skull; and that skull was the finest in his collection—that of a Greek being the next.' Hence it was taken as the type of the skull of the more organised divisions of our species. More than this, it gave its name to the type, and introduced the term *Caucasian*. Never has a single head done more harm to science than was done in the way of posthumous mischief by the head of this well-shaped female from Georgia.' See *ETHNOLOGY*.

**CAUCASUS**, a mountain-range of great geographical and ethnographical importance, occupying the isthmus between the Black Sea and the Caspian, its general direction being from west-north-west to east-south-east—from the peninsula of Taman on the Black Sea, in lat.  $45^{\circ} 10' N.$ , long.  $36^{\circ} 45' E.$ , to the peninsula of Apaheron on the Caspian, in lat.  $40^{\circ} 20' N.$ , long.  $50^{\circ} 20' E.$ —a length of about 750 miles. The breadth, including the secondary ranges and spurs, may be stated at about 150 miles, but the breadth of the higher C. is much less, not much exceeding 60 or 70 miles. This range, formerly belonging entirely to Asia, now forms part of the boundary-line between Europe and Asia. The higher and central part of the range is formed of parallel chains, not separated by deep and wide valleys, but remarkably connected by elevated plateaus, which are traversed by narrow fissures of extreme depth. The highest peaks are in the most central ridge or chain—Mount Elburz attaining an elevation of 18,000 feet above the sea, while Mount Kasbeck reaches a height of more than 16,000 feet, and several others rise above the line of perpetual snow, here between 10,000 and 11,000 feet high; but the whole amount of perpetual snow is not great, nor are the glaciers very large or numerous. This central chain is formed of trachyte. The secondary parallel chains are, on the inner side, mostly formed of argillaceous slate and Plutonic rocks; on the outer side, of limestone. The spurs and outlying mountains or hills are of less extent and importance than those of almost any other mountain-range of similar magnitude, subsiding as they do until they

are only about 200 feet high along the shores of the Black Sea. Some parts are entirely destitute of wood, but other parts are very densely wooded, and the secondary ranges, near the Black Sea, exhibit most magnificent forests of oak, beech, ash, maple, and walnut; grain is cultivated in some parts to a height of 8000 feet, while, in the lower valleys, rice, tobacco, cotton, indigo, &c., are produced. As might be expected from the geographical situation of the C., the climate, though it is generally healthy, is very different on the northern and southern sides, the vine growing wild in great abundance on the south, which is not the case on the north. The southern declivity of the mountains, towards Georgia, presents much exceedingly beautiful and romantic scenery.

There are no active volcanoes in Mount C., but every evidence of volcanic action. There are mud volcanoes at each end of the range, and there are also famous naphtha springs in the peninsula of Apaheron. See *BAKU*. Mineral springs also occur in many places. The bison, or aurochs, is found in the mountains; in the forests are many fur-bearing animals; and game abounds. Bears, wolves, and jackals are among the carnivorous animals. Lead, iron, sulphur, coal, and copper are found.

The waters of the C. flow into four principal rivers—the Kuban, and the Rion or Faz (the *Phasis* of the ancients), which flow into the Black Sea; and the Kur and the Terek, which flow into the Caspian. The Russians have carried a military road, with great labour and danger, through a valley somewhat wider than most of the Caucasian valleys, between the sources of the Kuban and the Terek. This road passes over a height of about 8000 feet, and is protected by many forts, but is exposed to other dangers besides those which arise from the hostility of the mountain tribes. The only other road is by the Pass of Derbend, near the Caspian Sea.

The resistance which the Caucasian tribes, for more than half a century, offered to the arms of Russia, attracted to them the attention of the world. But with the capture (1859) of the prophet-chief of the Lezghians—Schamyl, the most active and determined of the foes of Russia, who for a quarter of a century withheld and harassed the armies sent against him—the power of the Caucasians was greatly shattered; and now that he is dead (he died April 1871), although several tribes still retain their independence, the Russians are said to regard the territory as virtually subjugated. The general name Circassians (q. v.) is often, but not very correctly, applied to the tribes which inhabit the Caucasus, and whose whole number is not above 1,300,000 or 1,500,000. From the situation of Mount C., there have gathered together in it tribes belonging to a greater number of distinct races than can perhaps be found within the same space anywhere upon the earth. There are more than 100 different languages or dialects spoken; the Turkish-Tartar language, however, serving for a general medium of communication. The different tribes inhabiting the C., long believed to be the purest type of the Indo-European family, are now considered not to belong to it at all, but to have more affinity with the Mongolian races. See *CAUCASIAN VARIETY OF MANKIND*. The principal tribes are the Tcherkezes or Circassians, Ossetes, Lezghians, Abasians, Georgians, Misheges, and Mingrelians. The Georgians and Ossetes are at least nominally Christians; the Lezghians are fanatical Mohammedans. The Byzantine emperors and kings of Georgia planted Christian churches throughout this region, and many ruins of them remain, some of which are very beautiful. But the present

Christianity of the nominally Christian tribes is more akin to heathenism than to true Christianity. In character, they are distinguished by their valour and love of freedom, but cruelty and treachery are also amongst their marked traits. They carry on a little agriculture, but live more by the care of herds and flocks, and by hunting; they are not averse to robbery; and the only manufacture which is carried on among them is that of arms.

**CAUCUS.** See AMERICANISM.

**CAUDEBEC-LÈS-ELBEUF**, a town of France, in the department of Seine-Inférieure, 12 miles south of Rouen. It has manufactures of cloth, and a population of 10,700.—**CAUDÉE** is also the name of a town in the same department, situated on the right bank of the Seine, 28 miles east of Havre. It is one of the prettiest and most picturesque little towns on the Seine, with its old wooden houses and elm-shaded quays. It has a fine Gothic church of the 15th c., and manufactures of cotton, silk-cloth, leather, and soap. Formerly the capital of the Pays de Caux, C. was strongly fortified; and in 1419, so obstinate was its resistance, that it took the great English general, Talbot, six months to capture it. Pop. 2000.

**CAUDETÉ**, a town of Murcia, Spain, 50 miles east-south-east of Albacete. The inhabitants, 5500 in number, are chiefly engaged in agricultural pursuits.—C. is also the name of a small place in New Castile, a few miles from Teruel, where there are some of the largest bone-deposits, fossilised and unfaçilised, in Europe.

**CAUDINE FORKS** (*Mercula Caudina*), two high, narrow, and wooded mountain-gorges near the town of Caudium, in ancient Samnium, on the boundary towards Campania. These gorges are celebrated on account of the defeat here suffered by the Romans in the second Samnite war (321 B.C.). Four Roman legions, commanded by the two consuls Titus Veturius and Spurius Postumius, after marching through a narrow pass, found themselves locked in a spacious valley, surrounded on all sides by lofty mountains, with no way out save that by which they entered, and another pass on the opposite side. Attempting to file through the latter, they found it blocked up with trees and stones, and commanded by the Samnites, who had also in the meantime made themselves masters of the other pass. Consequently, the four legions were compelled to encamp in the valley. After some days, famine compelled them to surrender unconditionally. The Samnite general, Caius Pontius, according to old custom, compelled the Romans to pass under the yoke, and then permitted them to march back. This submission was regarded as too ignominious for Rome, and consequently the two consuls and the other commanders were delivered again into the hands of the Samnites, who, however, refused to have them.

**CAUL** is a thin membrane encompassing the heads of some children when born, and is mentioned here on account of the extraordinary superstitions connected with it from very early ages down to the present day. It was the popular belief that children so born would turn out very fortunate, and that the C. brought fortune to those purchasing it. This superstition was so common in the primitive church, that St Chrysostom felt it his duty to inveigh against it in many of his homilies. In later times, midwives sold the C. to advocates at enormous prices, 'as an especial means of making them eloquent,' and to seamen, as an infallible preservative against drowning. It was also supposed that the health of the person born with it could be told by the C., which, if firm and crisp, betokened health, but if relaxed and flaccid, sickness or death. During

690

last century, it was common to find advertisements in the newspapers of cauls to be sold—from £10 to £30 being the prices asked for them. So recently as 8th May 1848, there was an advertisement in the *Times* of a C. to be sold, which 'was afloat with its late owner thirty years in all the perils of a seaman's life, and the owner died at last at the place of his birth.' The price asked was six guineas. Sir John Offley, of Madaley Manor, Staffordshire, by his will, proved at Doctors' Commons 1838, devised a C. set in jewels, which had covered him when he was born, to his daughter, thereafter to her son, and then to his own heirs-male. The C. was not to be concealed or sold out of the family. See Brand's *Popular Antiquities*, vol. iii.; *Notes and Queries*, 1st series, vol. vii.

**CAULAINCOURT**, ARMAND AUGUSTIN LOUIS DE, Duke of Vicenza, a statesman of the French empire, was born at Caulaincourt, a village in the department of Somme, December 9, 1772. He entered the army at the age of fifteen, rapidly attained promotion, and, as colonel of a regiment of carabiniers, distinguished himself in the campaign of 1800. He was made a general of division in 1805, and shortly after created Duke of Vicenza. In 1807, he was appointed ambassador at St Petersburg, where he soon gained the confidence of the czar, who often made use of his advice. Disputes having arisen between Alexander and Napoleon, C. endeavoured to restore amity and prevent war; but his proposals being rejected, he, in 1811, asked permission to resign his post, and received an appointment in the army of Spain. During the events of 1813, he was frequently employed as plenipotentiary in diplomatic affairs. In November of 1813, he was made Minister for Foreign Affairs, and in this capacity attended the congress at Chatillon, January 1814. When Napoleon abdicated, C. endeavoured to make use of his influence with Alexander to obtain the most favourable conditions for the fallen emperor, and, chiefly through his intervention, the island of Elba was ceded to Napoleon. During the Hundred Days, C. resumed office as Minister of Foreign Affairs, and was made a peer. On the second restoration, he retired into private life. He died in Paris, February 19, 1827. His brother, AUGUST JEAN GABRIEL, Count of Caulaincourt, born 1777, served with distinction in all the campaigns from 1792 to 1812, when he fell in battle.

**CAU'LIFLOWER**, a variety of the common kale or cabbage, affording one of the most esteemed delicacies of the table. It was cultivated as a culinary vegetable by the Greeks and Romans. Its culture was, however, little attended to in England till the end of the 17th c.; but after that time, it rapidly increased, and prior to the French Revolution, C. formed an article of export from England to Holland, whilst English C. seed is still preferred on the continent. The C. is entirely the product of cultivation. The leaves are not in this, as in other varieties of the same species generally, the part used, nor are they so delicate and fit for use as those of most of the others, but the flower-buds and their stalks, or, properly speaking, the inflorescence of the plant deformed by cultivation, and forming a head or compact mass generally of a white colour. There are many subvarieties, but all of them are rather more tender than the ordinary forms of the species, and in Britain generally require more or less protection during winter, whilst the seed is sown on hotbeds, that the plants may be ready for planting out in spring. Later sowings are made in the open ground. The C. requires a moist rich loamy soil, with abundance of manure, and above all, very

## CAULKING—CAUSE.

careful cultivation, which is directed to the object of having the heads not merely large, but as compact as possible. Great care is bestowed on the selection of proper plants for seed. In Scotland, C. plants almost always require the protection of the frame during winter. C. may be preserved for some time fit for use by pulling the plant up by the roots, and hanging it in a cold and dry place—Broccoli (q. v.) may be regarded as another kind of cauliflower.

CAULKING is the operation of driving oakum or untwisted rope into the seams of a ship, to render them water-tight. The quantity thus driven in depends on the thickness of the planking; it varies from 1 to 13 double threads of oakum, with 1 or 2 single threads of spun-yarn. The caulkers first *rains* or *reems* the seam—that is, drives a C. iron into it, to widen the seam as much as possible, and close any rents or fissures in the wood; he then drives in a little spun-yarn or white oakum with a mallet and a kind of chisel, and afterwards a much larger quantity of black or coarse oakum. The fibres are driven in until they form a densely hard mass, which not only keeps out water, but strengthens the planking. The seam is finally coated with hot pitch or resin.

CAULOPTERIS, a generic name for the stems of fossil tree-ferns found in the Carboniferous and Triassic measures. They are hollow, and covered with the markings similar to the leaf-scars on recent tree-ferns. Twelve species have been described.

CAUSE. The words ‘Cause,’ ‘Causality,’ and ‘Causation,’ although familiar and intelligible in ordinary speech, have given rise to some of the most subtle questions in philosophy and theology. We shall here advert briefly to the chief meanings of these terms, and in so doing, we shall indicate the disputes that have arisen in connection with them.

In common language, we are accustomed to describe as the C. of an event, the one event immediately preceding it, and but for which it would not have happened. A man slips his foot on a ladder, falls, and is killed: we give the slipping of the foot as the C. of the fatality. A legislative assembly decides a question of great moment by the casting vote of the president, who is then not unfrequently spoken of as the C. of all the good or evil that followed on the decision. Now, a slight examination shews that this mode of speaking is defective, as expressing the whole fact, or, in other words, presumes a great deal that is not stated. In the supposed death from a fall, there are many conditions necessary to the result besides the slipping of the foot: the weight of the body, the height of the position, the hardness of the ground, the fragility of the human frame, all enter into the C. strictly represented; but for practical purposes, we leave out of account all those elements that are not at the moment under our control, and allude to the one that is so. And when we speak of the decision of an assembly being the effect of the president’s vote, we mean that his share in the responsibility is peculiarly great, or that, in order to turn the vote in one way, all that is necessary is to secure his individual opinion. If we do not enumerate all the conditions of the event, it is because some of them will, in most cases, be understood without being expressed, or because, for the purpose in view, they may without detriment be overlooked.

When, however, we aim at strict accuracy, as in the investigations of science, we must not be content with singling out the one turning event, but must enumerate everything that is necessary to the

result. A scientific C. is the full assemblage of conditions, failing any one of which, the effect would not happen. In a full explanation of the phenomenon of the tides, we must enumerate all the circumstances connected with their production—the attraction of the sun and moon, the motions of the earth and the moon in their orbits, the globular form and rotation of the earth, the liquidity of the sea, the mode of distribution of the sea over the earth—every one of which facts is an essential in the full causation. The effect cannot be adequately accounted for without advertising to every one of those conditions, and it is therefore the sum-total of them that is rightly described as the C. of the tides. Taking this complete view of causation, it is found that every event that happens in the sequel to some previous event, in whose absence it would not have been, but which being present it is sure to occur. Between the phenomena existing at any instant, and the phenomena existing at the succeeding instant, there is an invariable order of succession; to certain facts, certain facts always do, and, as we believe, will continue to succeed. The invariable antecedent is termed the C.; the invariable consequent, the effect. What is termed the *Law of Universal Causation*, consists in this, ‘that every consequent is connected in the manner now described with some particular antecedent, or set of antecedents.’—Mill’s *Logic*, book iii. chap. 5.

The physical philosopher—the chemist or physiologist—trusts to the uniformity with which the same C. yields the same effect; and if he can find out the true succession in one instance, he is satisfied that the same succession will always hold. In the physical sciences, therefore, there is no dispute as to the law of causation itself; the controversies on that head occur only in *metaphysics*. It is made a serious problem by mental philosophers, and also by theologians, to determine how we come by the irresistible belief that we are said to possess, that every event has, and must have a cause. There are many answers to this question: eight are enumerated by Sir William Hamilton (*Discussions on Philosophy*, p. 611, 2d edit.). It is only necessary, however, to advert to the two radically opposite points of view from which the subject is now surveyed.

The one view is, that we have an instinct or intuition of the mind by which we are compelled to recognise this law, so that to us it is a necessary truth, which we cannot escape from if we would. Our experience of the outer world, doubtless, shews us that things follow one another in an orderly and uniform manner, that the stone that sinks in water to-day does not float to-morrow, but no experience could give us the sense of commanding necessity that we have of the law of C. and effect. ‘Causation is not the mere invariable association of antecedent and consequent; we *feel* that it implies something more than this.’ The philosophers who maintain this side give forth two different affirmations: the one, that we actually possess an intuitive belief of necessary causation; and the other, that our possession of the belief is a sufficient proof that the law actually pervades the universe. Experience operates to confirm us in those instinctive tendencies, but no amount of experience would have been able to create them.

The latest modification of the theory that ascribes our belief in causation to an intuition of the mind, is the doctrine promulgated by Sir W. Hamilton, to the effect that ‘we are unable to think that the quantity of existence, of which the universe is the conceived sum, can be either amplified or diminished. We are able to conceive, indeed, the creation of a world; this, in fact, as easily as the creation of an

atom. But what is our thought of creation? It is not a thought of the mere springing of nothing into something. On the contrary, creation is conceived, and is by us conceivable, only as the evolution of existence from possibility into actuality, by the fiat of the Deity. And what is true of our concept of creation, holds of our concept of annihilation. We can think no real annihilation—no absolute sinking of something into nothing.'—*Discussions*, p. 619. Thus, every effect must have a C., and every C. must have its effect, because, if it were not so, there would be either a pure creation or a pure annihilation, neither of which, according to Sir W. Hamilton, is thinkable or conceivable by the human mind. This doctrine, however, has not found acceptance even by those who, if not actual disciples of the author, are most disposed to receive his philosophy generally, as may be seen by referring to Professor Fraser's *Essays in Philosophy*, p. 170; M'Cosh *On the Divine Government*, p. 529, 4th edition; and Mansel, art. Metaphysics, *Encyclopaedia Britannica*. So far from the creation or annihilation of matter or force being inconceivable, it may be said with truth, that until the end of last century, it was not known as a fact that the materials of the globe are absolutely indestructible. The effects of combustion and evaporation could hardly suggest anything else than the annihilation of a certain portion of material. Combustion merely transformed the material consumed into other shapes, nothing being absolutely lost. So much for ponderable matter. As regards force, or moving power, the demonstration that this is never absolutely lost, even on the many occasions when it is so to all appearance, is a still later result of laborious scientific inquiries, being, in fact, one of the conclusions arrived at within the last few years. See **FORCE**. To represent, therefore, one of the latest achievements of experimental science as a primitive intuition of the human mind, is to violate, in the strongest manner, our sense of propriety and consistency.

As opposed to the intuitional doctrine of causation, we have a variety of views by Hume, Dr Thomas Brown, and others, which need not be specified in detail. One may be given as an example. It has been seen that there are two affirmations in the theory just discussed; that the mind possesses an intuitive belief of causation, and that the possession of this belief is evidence of the existence of the law. Now, one or both of these affirmations may be denied; and the denial of either, by even a small minority of the human race, is held to be fatal to the theory, because *unanimity* is essential to the establishment of a universal instinct. Now, many men may possess an instinctive belief in the necessity of a cause to all effects, and of an effect to all causes; some, it is affirmed, do not; it cannot, therefore, be a universal or essential part of human nature.

In like manner, the second affirmation—namely, that the possession of an instinctive belief is a proof of the truth of the thing believed—is denied, on the ground that our instincts often dispose us to believe things that experience shews to be untrue. We have a strong natural tendency to believe in the universality and continuance of the exact order of things that we are ourselves born into, and are only put right by seeing the contrary. 'A mere disposition to believe, even if supposed instinctive, is no guarantee for the truth of the thing believed. If, indeed, the belief ever amounted to an irresistible necessity, there would be then no use in appealing from it, because there would be no possibility of altering it. But even then the truth of the belief would not follow: it would only follow that mankind were under a permanent necessity of believing what

might possibly not be true; just as they were under a temporary necessity—quite as irresistible while it lasted—of believing that the heavens moved, and the earth stood still. But, in fact, there is no such permanent necessity. Many of the propositions of which this is most confidently stated, great numbers of human beings have disbelieved. The things which it has been supposed that nobody could possibly help believing, are innumerable; but no two generations would make out the same catalogue of them.'—Mill's *Logic*, book iii. chap. 21. Mr Mill and others hold that the proof of the law of causation rests exclusively on the uniform and growing experience of the human race. This, however, is not inconsistent with our possessing the natural instinct above alluded to, by which we are led to suppose that what is will continue, and what has been will be repeated; an instinct that coincides, to a certain extent, with the law of C. and effect, and is therefore a predisposition on our part to accept what experience teaches on this head. It is only maintained that the instinct is of itself *no proof*, although useful in so far as it prepares us for what there is real evidence for believing. By yielding to the instinct in its crudest shape, the inhabitant of the tropics scouts the idea that water can ever be solid; the African would deny the existence of white men; and even an intelligent European could not be persuaded that any metal would float. Experience must correct the instinctive tendencies, otherwise no reliance can ever be placed upon them; by which we acknowledge it as the sole test of truth, while intuitive dispositions are no test whatever.

Even those who maintain the instinctive necessity of the conviction we are discussing, admit two great exceptions—viz., the existence of a **First C.**, itself uncaused, and the **Liberty of the Will**, or the exemption of human actions from the rule that applies so strictly to physical nature.

It is further contested between the two opposite schools of philosophy, whether or not **MIND** be the sole ultimate C. of all phenomena, as it is the C. most familiar to us—namely, the source of our voluntary exertions. On one side, it is affirmed to be 'inconceivable that dead force could continue unsupported for a moment beyond its creation. We cannot even conceive of change or phenomena without the energy of a mind.' 'The word action has no real significance, except when applied to the doings of an intelligent agent.' 'Phenomena may have the semblance of being produced by physical causes, but they are in reality produced by the immediate agency of a mind; if they do not proceed from the human, they are the result of the divine will.' To this it is replied, that we are here taking for granted that every kind of power is analogous to that which we happen to be first acquainted with; but it is a pure assumption without proof or relevance, to suppose that all modes of energy must conform to this one type.—Mill, book iii. chap. 5. It is further pointed out that even in ourselves, pure mind, or mind acting by itself, is not known to be an efficient C.; it must be mind together with body. The labourer cannot sustain a day's toil merely because of his *wish* to do so; he must be fed, and rested, and have all his bodily organs in good condition, in order to do his work. The human system, when employed as a prime mover, can no more dispense with the material conditions, than a steam-engine can work without coal, or when out of repair.—Bain *On the Emotions and the Will*, p. 472.

The subject of causation was very particularly studied by Aristotle. He enumerated four different kinds of causes, which have ever since had a place in

## CAUSTIC—CAUTION.

philosophy. These are the *material*, the *formal*, the *efficient*, and the *final*. The first, or *material*, is what anything is made of; brass or marble is the material C. of a statue. The *formal* is the form, type, or pattern according to which anything is made; the drawings of the architect would be the formal C. of a house. The *efficient* is the power acting to produce the work, the manual energy and skill of the workmen, or the mechanical prime mover, whether that be human or any other. The *final* C. is the end or motive on whose account the work is produced, the subsistence, profit, or pleasure of the workman. Aristotle mentions the case of a physician curing himself, as exemplifying all the causes in one and the same subject. It is obvious that these are what we should now term the aggregate of *conditions* necessary to the production of any work of man; it being essential that there should be a motive for the work (final), a material to operate upon (material), a plan to proceed by (formal), and an exertion of energy to do what is wanted (efficient). When nature is viewed as the result of a creative mind, these causes are considered as inhering in the Divine contrivance.

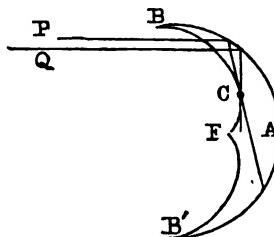

In popular language, C. is held as identical with *explanation*. In other words, when a phenomenon which we are puzzled to account for is explained to our satisfaction, we say that we know its cause, but we often seek for, and are satisfied with, explanations that have no value in the view of science; and on the other hand, refuse to rest content with such as are scientifically valid. People occasionally insist on knowing the C. of gravity itself, something deeper than the discovery of Newton, and whatever explanation satisfies the mind, would be accepted as the cause. Sometimes a theological explanation is offered, and at other times, a metaphysical necessity is put forth.

**CAU'STIC** (Gr. *burning*), in Medicine and in Chemistry, is the term applied to such substances as exert a corroding or disintegrating action on the skin and flesh. *Lunar C.* is nitrate of silver, and *common C.* is potash. When used as a C. in medicine, the substance is fused and cast into moulds, which yield the C. in small sticks the thickness of an ordinary lead pencil, or rather less.—*Caustic* is also used in chemistry in an adjective sense—thus C. lime, or pure lime ( $\text{CaO}$ ), as distinguished from mild lime, or the carbonate of lime ( $\text{CaO}_2\text{CO}_3$ ), C. magnesia ( $\text{MgO}$ ), and mild magnesia ( $\text{MgO}_2\text{CO}_3$ ), &c.‘

**CAUSTIC, CATACAUSTIC, and DIACAUSTIC.** In Optics, Caustic is the name given to the curved line formed by the ultimate intersections of a system of rays reflected or refracted from a reflecting or refracting surface, when the reflection or refraction is inaccurate. When the caustic curve is formed by reflection, it is called the Catacaustic—sometimes simply the Caustic; when formed by refraction, it is called the Dia caustic Curve. In mathematical language, a curve formed by the ultimate intersections of a system of lines drawn according to a given law is called the *envelope*, and is such that the lines are all tangents to it. As in a system of rays reflected or refracted by the same surface all follow the same law, it follows that the C. is the envelope of reflected or refracted rays.

An example of the catacaustic is given in the annexed figure for the case of rays falling directly on a concave spherical mirror, BAB', from a point so distant as to be practically parallel. The curve may be said to be made up of an infinite number of points, such as C, where two very near rays, such as P, Q, intersect after reflection. This catacaustic is an epicycloid. The curve varies, of

course, with the nature of the reflecting surface. In the case represented in the figure, the cusp point is at F, the principal focus. No such simple example can be given of the dia caustic curve as

that above given of the catacaustic. It is only in the simplest cases that the curve takes a recognisable form. In the case of refraction at a plane surface, it is shewn that the dia caustic curve is the evolute either of the hyperbola or ellipse, according as the refractive index of the medium is greater or less than unity.

The reader may see a catacaustic on the surface of tea in a tea-cup about half full, by holding the circular rim to the sun's light. The space within the caustic curve is all brighter than that without, as it clearly should be, as all the light reflected affects that space, while no point without the curve is affected by more than the light reflected from half of the surface.

**CAU'TION**, in the Law of Scotland, like *Guaranty* (q. v.) in England, is an obligation undertaken by a second party, whereby he binds himself, failing the primary obligant, to fulfil his obligation, whether it be of a pecuniary nature or otherwise. Cautionary obligations, like engagements of guaranty, are thus essentially of a secondary nature; and previous to the passing of the Mercantile Law Amendment Act (19 and 20 Vict. c. 60), it was customary in Scotland to distinguish between what was called *cautionary proper*, where the cautioner was bound avowedly as such, and *improper cautionary*, where both cautioner and principal were bound as principals. Since this period, however (1856), cautionary proper has ceased to exist otherwise than as the result of positive stipulation, under the saving-clause attached to the eighth section of the statute referred to, which enacts that ‘nothing herein contained shall prevent any cautioner from stipulating, in the instrument of caution, that the creditor shall be bound, before proceeding against him, to discuss and do diligence against the principal debtor.’ Cautionary obligations are generally gratuitous, being, for the most part, undertaken from motives of friendship; but it is by no means uncommon for them to be entered into in consideration of a premium paid by the person guaranteed, or by those interested in his fortunes. The existence of such a consideration has always been optional in Scotland, and this rule has recently been adopted in England (19 and 20 Vict. c. 97, § 3). Where a premium is paid, the transaction becomes a mere insurance of solvency, honesty, or efficiency; and associations of great public utility (see *GUARANTEE ASSOCIATION*) have been formed, both in England and Scotland, for the purpose of undertaking, as a speculation, to guarantee the good conduct of persons employed either in public or private offices of trust. The tendency of judicial decisions, both in England and Scotland, for many years past, has been to require greater strictness than formerly in the constitution of cautionary obligations; and latterly, the legislature itself has stepped in with the same object in view. By the statute which we have

## CAUTION—CAVAGNAC.

already quoted, it is enacted that all such engagements shall be in writing, subscribed by the person undertaking or making them, or by some person duly authorised by him, otherwise they shall have no effect. If a cautionary obligation is dependent on a condition, it will, of course, be ineffectual unless the condition be complied with. The cautioner may, in general, plead every defence which was competent to the principal debtor, and the extinction of the primary obligation extinguishes the secondary one. The discharge of one cautioner, moreover, unless consented to by the rest, is a discharge to all. Cautioners bound subsequent to the passing of the act mentioned, have, in consequence of the eighth section already referred to, no right to what in Scotland was called *Discussion* (*q. v.*); but those bound prior to that act are entitled, as formerly, to require that the creditor shall first call on the principal debtor, and compel him to pay in so far as he is able, or, in law language, *discuse* him. The cautioner is entitled, on payment of the obligation, to an assignation of the debt and diligence, by which means he comes, in all respects, into the creditor's place; and, moreover, if the solvency or other conditions of the principal debtor should seem precarious, he may adopt legal measures for his relief. Co-cautioners, or persons bound together, whether their obligations be embodied in one or several deeds, are entitled to mutual relief. But where a co-cautioner obtains relief from the others, he must communicate to them the benefit of any deduction or ease which may have been allowed him in paying the debt.

Cautionary obligations are often undertaken in behalf of persons in situations in which the engagements and liabilities are prospective. In order that such obligations may be binding, the nature and extent of the liability must be fairly and fully disclosed to the cautioner. But while the cautioner must not be exposed to the danger arising from any transaction not in his view in entering into the contract, he is not entitled to withdraw without due notice and a reasonable time being given for entering into a new arrangement. The question whether the effects of a bond are prospective, or retrospective merely, will depend on its terms; the presumption, where these are in any way doubtful, being always in favour of the latter alternative. The creditor is bound to exercise a certain degree of vigilance over the conduct and circumstances of the person guaranteed, and not to permit any very gross departure from the terms of the contract, to the prejudice of the cautioner. Should this obligation be neglected, the cautioner will be freed from his obligation.

**CAUTION**, for a cash credit. See **CASH CREDIT**.

**CAUTION, JUDICIAL**, in the Law of Scotland, is of two kinds—for appearance, and for payment. If a creditor makes oath before a magistrate, that he believes his debtor to be meditating flight (*in meditatione fuga*), he may obtain a warrant for his apprehension; and should he succeed in proving the alleged intention to flee, he may compel him to find C. to abide the judgment of a court (*judicis sieti*). The second kind of judicial C. is by *Bond of Presentation*, which is granted when the creditor is about to execute personal diligence, or has done so, and the cautioner, on condition of an indulgence to the debtor, binds himself that the debtor shall be forthcoming at the appointed time, otherwise he himself will pay the debt. The object of this form of C. is simply to protect the debtor from imprisonment, and allow him time.

**CAUTION, JURATORY.** See **Poor's ROLL**, and 13 and 14 Vict. c. 36, § 34.

694

**CAUVERIPU'RAM**, a town of the district of Coimbatoor, in the presidency of Madras, on the right bank of the Cauvery, in lat. 11° 54' N., and long. 77° 48' E. It takes its name from the neighbouring gorge of 30 miles in length through the Eastern Ghauts, along which the Cauvery finds a passage.

**CAUVERY**, a river in the south of Hindustan, rising near lat. 12° 25' N., and long. 75° 34' E., and flowing, with a course of 472 miles, into the Bay of Bengal by various mouths. Its delta, with a coast of 80 miles, and a depth of 70, lies almost wholly in the district of Tanjore. The C. is peculiarly available for irrigation; and for improving it in this respect, a grant of £50,000 was sanctioned in 1841. During the rainy season, the stream is navigable for small-craft.

**CAVA**, La, a town of Italy, in the province of Salerno, 3½ miles N.W. of the town of Salerno. It is a flourishing place, with manufactures of silk, cotton, linen, and pottery. Pop. 13,000. About a mile from C. is the celebrated Benedictine monastery of the Trinity, with its magnificent archives, containing 60,000 MSS. and 40,000 parchment rolls. Its library, at one time also rich in MSS. and rare printed books, has been dispersed. In the monastic church are the tombs of Queen Sibilla and of various anti-popes.

**CAVAGNAC**, LOUIS EUGÈNE, was born in Paris 1802, and was educated in the Polytechnic School, and the *École d'Application* at Metz. He first served in the Morea, and afterwards in Africa (whither he was sent in 1832 into a kind of honourable exile, in consequence of a too free expression of opinion in favour of republican institutions), where he acquired great distinction by his energy, coolness, and intrepidity. He was made chef de bataillon in 1837, and rose to the rank of brigade-general in 1844. In 1848, he was appointed governor-general of Algeria, but in view of the impending revolutionary dangers, was called to Paris, he having also been elected as a delegate to the National Assembly by the two departments of Lot and Seine. In the insurrection of June which followed, C., as Minister of War, had a most difficult task to play, and he displayed, during the four days and nights of the contest, remarkable presence of mind, firmness, and activity. His plan of action appeared strange and almost traitorous at the time. In opposition to the wishes of the National Assembly, who desired that the troops should be dispersed over Paris, he divided his men into three separate bodies, which had to clear their several routes from obstacles, in order to effect a reunion, streets and even quarters of the city being left for some time without military protection. Regarding the outbreak more as the beginning of a civil war than a mere insurrection, he, in fact, met the insurgents in true order of battle. His operations were successful, and his clemency was as remarkable as his generalship. When he had the power of assuming the dictatorship, he resigned it into the hands of the National Assembly, which appointed him President of the Council. As a candidate for the presidency of the republic, when Louis Napoleon was elected, he received about a million and a half of votes. On the *coup d'état* of December 1851, C. was arrested, but released after a short detention; and though he consistently refused to give in his adhesion to the Empire, he was permitted to reside in France without molestation. He died very suddenly of heart disease in October 1857, at his country house near Tours, and was buried in the cemetery of Montmartre, Paris, in presence of many thousand spectators, including several republican leaders. In debates, C. was remarkably unlike

## CAVALIER—CAVAN.

his countrymen, being not voluble and declamatory, but sober, clear, and moderate.

**CAVALIER**, in Fortification, is a defence-work constructed on the *terre-plein* or level ground of a bastion. It rises to a height varying from 8 to 12 feet above the rampart, and has a parapet about 6 feet high. Its uses are to command any rising ground held by the enemy, within cannon-shot; and to guard the curtain, or plain wall between two bastions, from being enfiladed. For these purposes, it mounts heavy ordnance. It may be either curved, or bounded by straight sides.

**CAVALIER** (Fr. *chevalier*; Ital. *cavaliere*; Span. *caballero*, probably from the Latin *caballus*, a horse), originally meant any horse-soldier, but in English history is the name given to the party which adhered to King Charles I., in opposition to the Roundheads (q. v.) or friends of the Parliament.

**CAVALLER-MAGGIO'RE**, a town of North Italy, in the province of Cuneo, 24 miles north-east of Coni. It was formerly fortified and defended by two castles, but of these there is now hardly a vestige remaining. It is a busy place, with a population of 5300.

**CAVALRY** is a general name for horse-soldiers or troopers. The subdivisions are very numerous; such as Guards, Dragoons, Lancers, Hussars, Cuirassiers, Mounted Rifles, &c. The C. force of the British army is usually divided into *Household* and *Line*. The numbers voted for 1873—1874 were:

	Household Cavalry.	Line Cavalry, Home Service.	Line Cavalry in India
Officers,	81	569	234
Non-commissioned Officers,	192	1,168	424
Rank and File,	1,029	9,906	3,672
	1,302	11,641	4,380

The difference between the household C. and the line is this: The former belong to the *Guards*, a specially favoured body of troops; while the latter comprise all who are *not* Guards. The regiments are 31 altogether. During more than half a century, the number was 26; but in 1858, two new regiments were created—to restore the 5th and 18th Dragoons, which had been struck out of the army list in 1799 for disloyalty in the Irish Rebellion; and in 1862, 3 regiments were taken over from the abolished local European army of India. The list comprises 2 regiments of Life Guards (red), 1 of Horse Guards (blue), 7 of Dragoon Guards, and 21 of Dragoons. Of these last-named 21 regiments, the 1st, 2d, and 6th are simply called Dragoons; the 5th, 9th, 12th, 16th, and 17th, Lancers; the 3d, 4th, 7th, 8th, 10th, 11th, 13th, 14th, 15th, 18th, 19th, 20th, and 21st, Hussars. A distinction is often made between *heavy* and *light* C.; and, in continental armies, this distinction is very marked; but in England, the men and horses are not selected with much reference to this matter; the heavy being often too light, and the light too heavy, to correspond with their designations. In so far as the distinction holds in the British army, the Dragoon Guards, Horse Guards, and Life Guards are classed and equipped as heavy C., the Dragoons medium, and the Lancers and Hussars as light C., for scouring a country. It was in the capacity of light C. that the Prussian Uhlans played so important a part in the late war between Prussia and France, acting as wide-stretching feelers to the main bodies to which they were attached.

The line C. regiments in the British service have generally 8 troops of 56 rank and file each, with 88 commissioned and non-commissioned officers to the

regiment. The officers for a full C. regiment comprise 1 colonel (as general officer), 1 lieutenant-colonel, 1 major, 8 captains, 18 subalterns and other commissioned officers, and 59 non-commissioned officers. A lieutenant-colonel in the Guards C. takes rank with a full colonel in the line C.; and a major in the former with a lieutenant-colonel in the latter—an arrangement that gives rise to some favouritism and jealousy; for the Guards are in no sense more meritorious soldiers than the line.

Nine months of drilling is the least time requisite to make a recruit fit to mount on duty, during which period he is drilled for eight hours a day. Londoners and agricultural labourers are mostly sought for; provincial mechanics are not found so available. The purchase of C. horses is an important matter. The veterinary surgeon of the regiment is sent out to buy; but no horse is paid for till approved by the commanding officer. The usual maximum of price fixed is £33 for a horse 3 to 5 years old; but the horse costs the nation £50 or £60 by the time it is thoroughly fit for service. See DRAGOONS, GUARDS, LANCERS, &c.

**CAVALRY TACTICS.** Authorities differ concerning the proportion that ought to be observed between cavalry and infantry in an army. In France and Austria, the ratio is about 1 to 5; in Prussia and Bavaria, 1 to 4; in Russia, 1 to 6; in England, 1 to 8.

So far as concerns actual duties, heavy cavalry charge the enemy's cavalry and infantry, attack the guns, and cover a retreat; while the light cavalry make reconnaissances, carry dispatches and messages, maintain outposts, supply pickets, scour the country for forage, aid the commissariat, pursue the enemy, and strive to screen the movements of the infantry by their rapid manoeuvres on the front and flanks of their army. At the battle of Balaklava, the heavy cavalry charge was within the reasonable duties of the troops, but that of the light cavalry was not; the former succeeded, the latter failed. A cavalry horse will walk 4 miles in an hour on general service, trot 8 miles in manoeuvring, and gallop 11 miles in making a charge. The cavalry usually attack in line against cavalry, *en échelon* against artillery, and in column against infantry. When an attack is about to be made, the cavalry usually group into three bodies—the attacking, the supporting, and the reserve. Close combat and hand-to-hand struggle are the province of cavalry; infantry and artillery may fight at a distance, but cavalry cannot. It is rare that two bodies of cavalry stand to fight each other; the weaker of the two, or the less resolute, usually turns and gallops off. The work to be done by the horse is to pursue, to overwhelm, to cut down. They cannot wait to receive an attack like infantry; they must either pursue or retreat; and on this account it has been said, ‘rest is incompatible with cavalry.’ The infantry and artillery more frequently win the victory; but the cavalry prepare the way for doing this, capture prisoners and trophies, pursue the flying enemy, rapidly succour a menaced point, and cover the retreat of infantry and artillery, if retreat be necessary. Cavalry is necessary to finish off work mainly done by others; and, without its aid, signal success is seldom obtained on the field. Many of the brilliant achievements of the British in 1857 and the following year, in India, were rendered almost nugatory by the paucity of cavalry, while, as a contrast, the German victories of 1870 were enhanced by the splendid services of their Uhlans and other light cavalry.

**CAVAN**, the capital of Cavan county, Ireland, Digitized by Google

is situated on a branch of the Annalee, 70 miles N.-W. of Dublin, with which it is connected by the Irish N.-W. Railway. The suburbs are chiefly wretched cabins. The principal buildings are in the west outskirts. A public garden was bequeathed by a late Lady Farnham, and the beautiful demesne of Lord Farnham lies between C. and Lough Oughter, which is about 5 miles W. Pop. (1871) 3532. Agriculture forms the chief industry of the people.

**CAVAN**, an inland county in the S. of Ulster, Ireland. It lies in the narrowest part of Ireland, 18 miles from the Atlantic, and 20 from the Irish Sea. Area, 746 sq. m. About three-fourths is arable. Bogs and hills, with many small lakes, are found in the N.-W. The chief rivers are the Erne, the Woodford, and the Annalee. The E. half of C. rests on clay-slate and grauwacke; the mountain district in the W. is carboniferous formation. Of minerals, C. affords coal, iron, lead, and copper, with many mineral springs. The climate is cold and damp; and the soil is poor, wet, and clayey, except along the streams. In 1872, of 477,360 acres, 155,048 were in crop, the chief crops being oats, potatoes, turnips, and flax. The farms are small. The population, which had fallen to 153,906 in 1861, was, in 1871, only 140,555, of whom 112,976 are Roman Catholics, 21,316 Episcopalians, and the rest of other denominations. Agriculture forms the chief industry, but linen is manufactured to a considerable extent. Chief towns—Cavan, Bailieborough, and Belturbet. C. returns two members to parliament. The pupils in national schools, in 1870, were 30,167, of whom 26,564 were Roman Catholics.

**CAVATINA**, a short form of operatic air, of a soft character, differing from the ordinary aria in consisting only of one part, and that spun out more in the form of a song. Modern composers have, however, disregarded this difference. Rossini mixes both. Weber, in his operas, adds an introduction or a recitative. The most perfect specimen of the C. is that in Meyerbeer's opera of *Robert the Devil*.

**CAVE**, EDWARD, deserves mention as the founder of the *Gentleman's Magazine*, the first literary journal of the kind ever established. He was born at Newton, in Warwickshire, in 1691; obtained a good education at Rugby; and after many vicissitudes, became apprentice to a printer. Obtaining money enough to set up a small printing-office, he projected the *Gentleman's Magazine*, which has now existed more than a century and a quarter. He was the friend and early patron of Samuel Johnson. C. died January 1754.

**CAVE**, WILLIAM, an English divine and scholar of distinction, was born at Pickwell, Leicestershire, December 1637. He studied at Cambridge; was appointed to the vicarage of Islington in 1662; afterwards to the rectory of Allhallows the Great, London; and in 1690 to the vicarage of Isleworth, Middlesex. He died at Windsor, August 4, 1713. He was the author of many works of a religious character, the most important of which are the *Lives of the Apostles*, *Lives of the Fathers*, and *Primitive Christianity*, which were once standard works.

**CA'VEÄT** (Lat. *caveo*, to beware), a judicial warning or caution. Caveats, in England, are used to stop the enrolment of decrees in Chancery, the issuing of lunacy commissions, &c. It consists in an intimation by the party interested to the proper officer, to prevent him from taking any step without such intimation being made to the said party as shall enable him to appear and object.

**CAVENDISH**, HENRY, a distinguished philoso-

696

pher of the 18th c., son of Lord Charles Cavendish, and nephew of the third Duke of Devonshire, was born at Nice, October 10, 1731. He studied at Cambridge, and devoted his whole life to scientific investigations. The large fortune which was bequeathed to him by an uncle, enabled him to follow uninterruptedly his favourite pursuits. He almost secluded himself from the world, and was so averse to meet with strangers, that he had his library—a magnificent one—built at a distance from his house, so that he might not encounter persons coming to consult it; and his female domestic servants had orders to keep out of his sight, on pain of dismissal. His dinner he ordered daily by a note placed on the hall-table. He died, unmarried, February 1810, leaving considerably more than a million sterling to his relatives. As a philosopher, C. is entitled to the highest rank. To him it may almost be said we owe the foundation of pneumatic chemistry, for prior to his time it had hardly an existence. In 1760, he discovered the extreme levity of inflammable air, now known as hydrogen gas—a discovery which led to balloon experiments, and projects for aerial navigation; and later, he ascertained that water resulted from the union of two gases—a discovery, however, to which Watt (q. v.) is supposed to have an equal claim. The accuracy and completeness of C.'s processes are remarkable. So high an authority as Sir Humphry Davy declared, that they 'were all of a finished nature, and though many of them were performed in the very infancy of chemical science, yet their accuracy and their beauty have remained unpaired amidst the progress of discovery.' C. also wrote papers on electricity, astronomical instruments, &c.

**CAVENDISH**, WILLIAM, Duke of Newcastle, a distinguished loyalist of the 17th c., son of Sir Charles Cavendish, younger brother of the first Earl of Devonshire, was born 1592. His learning and winning address made him a favourite at the court of James I., who, in 1610, made him a Knight of the Bath. Other honours rapidly succeeded. In 1620, he was made a peer of the realm. Charles I., about 1628, gave him the title of Earl of Newcastle-upon-Tyne, and in 1638 intrusted him with the tuition of his son, afterwards Charles II. His support of the king during the contest with the parliamentary forces was munificent. He contributed £10,000 to the treasury, and raised a troop of 200 knights and gentlemen, who served at their own cost. As general of all the forces raised north of the Trent, he had power to issue declarations, confer knighthood, coin money, and raise men; and the last part of his commission he executed with great zeal. The banquets C. gave to the king when he went north were magnificent enough to find record in history; one of them cost no less than £15,000, even in those days when money was more valuable than it now is. After the battle of Marston Moor, C. retired to the continent, where he resided, at times in great poverty, until the Restoration. On his return, he was created Duke of Newcastle. He died December 25, 1676. On the continent, he devoted himself to literature, and wrote a book on the management of horses, and several plays, not of a character to increase any man's reputation for intelligence.

**CAVENDISH**, MARGARET, Duchess of Newcastle, second wife of the above, born about the end of the reign of James I., is perhaps one of the most remarkable instances on record of a person afflicted with the *cacoëthes scribendi*, who had no capacity whatever for writing. She produced no less than 13 folio volumes, 10 of which were printed, treating,

## CAVES—CAVIARE.

indifferently, on all subjects in prose and poetry, and careless in all, both as to grammar and style. Her mania for scribbling kept up her maids at night, so that, if she chanced to wake with anything on her mind, they might be ready to note it down at once. The duchess was relieved, but a dead-weight fell upon the field of literature. She died in 1673.

CAVES, or CAVERNS (*Lat. cava*, hollow), are hollow places in the earth. They are either natural or artificial. Natural C. have been produced by the fracture and dislocation consequent on the upheaval of the strata, by water, or by both causes combined. The denuding or eroding power of water, which has produced the materials of stratified rocks, has formed caverns in the courses of rivers and on the coast-line of the sea. The moving waters, carrying with them gravel and sand, enter natural cracks and crevices, and by abrading their walls, increase their size, so as to form C.; or they attack less indurated portions of the solid strata, and form cavities bounded by the harder rock. Such caverns are of frequent occurrence round the shores of Britain, and indicate, where they occur, an ancient sea-margin of the island. In limestone rocks, the destroying power of water is increased when it contains chemical agents which have the power of dissolving the substance of the rock, and so causing it to be carried off in solution by the water.

C. most frequently occur in limestone rocks. They especially abound in the oolitic limestone, which on this account was called by the earlier continental geologists 'cavern limestone.' The celebrated C. of Franconia in Germany, of Kentucky (q. v.) in America, that of Kirkdale in Yorkshire, and many others, occur in this formation. Next to limestone, the triassic measures, containing rock-salt, a material easily removed by water, most abound in caverns. They are also frequently met with in igneous rocks—the picturesque cave of Fingal, in Staffa, is formed in basalt; and in South America and Iceland the modern lava contains large caverns.

Many caverns have a calcareous incrustation lining their interior, giving them a gorgeous appearance. Sometimes this deposit is pure white, and has, when the cave is lighted up, a richness and transparency that cannot be imagined. It is, however, more generally coloured by the impurities which the water has taken up from the superincumbent strata. To the incrustations which are suspended from the roof, like icicles, the name stalactite is given, while those rising from the floor are designated stalagmites. Sometimes the pendent stalactite is produced so as to meet the ascending stalagmite, and form pillars, as if to support the roof, as in the 'Organ' in the Blue John Mine, Derbyshire. The source and origin of this deposit has been satisfactorily explained by Liebig as follows. The mould of the superficial soil, being acted upon by moisture and air, evolves carbonic acid, which is dissolved by rain. The rain-water thus impregnated, permeating the calcareous strata, has the power of taking up a portion of the lime, which it retains in a liquid condition, until from evaporation the excess of carbonic acid is parted with, when the lime again returns to its solid state, and forms the incrustation.

C. have an additional interest to the geologist, from the occurrence in many of osseous remains under the calcareous incrustations of the floor. The bones are imbedded in mud, and frequently concreted into a firm calcareous breccia. They belong to the Pleistocene period, when the C. in Europe were inhabited by large hyenas and bears. Portions of other animals inhabiting the neighbourhood were

dragged by them into their dens, to serve as food. In this way the bones of herbivorous and other animals are found mixed with those of the beasts of prey; they have a broken and gnawed appearance, similar to what is produced on recent bones by the teeth of a hyena. No less than 33 species of mammals and 5 species of birds have been discovered in the C. of the British Islands, of which about the half still survive in Europe, while the remainder are extinct. The mammals are species of ox, deer, horse, wolf, dog, hare, fox, weasel, water-rat, mole, bat, hippopotamus, and rhinoceros, besides the hyena and bear; and the birds are species of lark, partridge, pigeon, goose, and crow.

The most productive ossiferous cavern in Britain is that at Kirkdale, 25 miles from York, in which the remains of about 300 hyenas have been detected, besides innumerable gnawed bones of those animals on which they preyed. The carboniferous limestones of Glamorganshire abound in caves, which have been explored by Buckland, and more recently and thoroughly by Dr Falconer. At the meeting of the Geological Society in June 1860, Dr Falconer thus describes the contents of one of them, called Bacon Hole. On the limestone floor of the cave are—(1) a few inches of marine sand, abounding with *Litorina rufa*, *L. littoralis*, and *Claesilia nigricans*, with bones of an *Arvicola* and Birds; (2) a thin layer of stalagmite; (3) two feet of blackish sand, containing a mass of bones of *Elephas antiquus*, with remains of *Meles taxus* and *Putorius*; (4) two feet of ochreous earth, limestone breccia, and sandy layers, with remains of *Elephas antiquus*, *Rhinoceros hemitachus*, *Hyaena*, *Canis lupus*, *Ursus spelaeus*, *Bos*, and *Cervus*; (5) irregular stalagmite; (6) two feet of limestone breccia and stalagmite, with bones of *Ursus* and *Bos*; (7) a foot or so of irregular stalagmite, with *Ursus*; and (8) dark-coloured superficial earth, kept sloppy by abundant drip, with bones of *Bos*, *Cervus*, *Canis vulpes*, horns of Reindeer and Roe-buck, together with shells of *Patella*, *Mytilus*, *Purpura*, and *Litorina* (probably brought into the cavern as food by birds), and also pieces of ancient British pottery. After a review of the Fauna of the bone caves of this country and of Europe, Dr Falconer concludes that the caves of Glamorganshire have probably been filled up with their mammalian remains since the deposition of the boulder-clay, and that there exist no mammalian remains in the ossiferous caves of England and Wales referrible to a fauna of a more ancient geological date. See KENT'S CAVERN.

Ossiferous C. occur in all parts of the globe. The fossils of those in Australia shew that the fauna of the Pleistocene period had a remarkable resemblance to that of the present day. The remains consist chiefly of kangaroos and allied genera of Marsupials.

CAVIARE, the salted roe of the common sturgeon (*Accipenser Sturio*) and other fishes of the same genus. See STURGEON. It is chiefly prepared in Russia, where it is greatly esteemed as an article of food. It is also used to a considerable extent in Italy and France. The species of sturgeon from the roe of which it is chiefly prepared, inhabit the Caspian and Black Seas and their tributary rivers. Among them are the Bielaga, or Great Sturgeon (*Accipenser Huso*), the Osseter (*A. Guldenstadii*), the Scherg or Sevruga (*A.stellatus*), and the Sterlet (*A. Ruthenus*). The C. made from the roe of the last-named species is esteemed particularly delicious, and is reserved for the Russian court. Astrakhan is a principal seat of the preparation of caviara. More than 400,000 lbs. of C. have been prepared in the Caspian fishery in a single year.

**CAVITÉ**, a town of considerable importance on the island of Luzon, one of the Philippines. It is situated on the bay of Manila, 10 miles south-south-west of the city of that name, of which it forms the quarantine station. It has a large cigar manufactory, is the chief naval dépôt of the Spanish possessions in the East, and gives name to a province with a population of 57,000. The population of the town itself is some 6000 or 7000.

**CAVOR**, or **CAVOUR**, a town of North Italy, situated at the foot of the Alps, 7 miles south-south-east of Pinerolo. It has manufactures of silk-twist, linens, leather, &c., and marble and slate quarries. Pop. 6000 or 7000.

**CAVO-RILIE'VO** (Ital.). In this peculiar kind of rilievo, which was extensively employed by Egyptian artists, the highest surface of the object represented is only on a level with the plane of the original stone, the rounded sides being cut into it. The effect resembles that of a concave seal. It is correctly described as *intaglio rilievo*. A wood-cut is given in Fairholt's *Dictionary of Terms in Art* of the Egyptian king Amunoph III in hieroglyphica.

**CAVOUR**, COUNT **CAMILLA BENSO DI**, a distinguished Italian statesman of the present time, the descendant of a noble and wealthy family of Piedmont, was born at Turin, August 10, 1810. He was educated for a military career, but his liberal tendencies being likely to prove an insuperable barrier to his promotion, he retired during the stirring events of 1830–1831, and devoted himself to agriculture, in which he introduced great improvements. He was the first to use guano in Piedmont; and, at his instigation, a national agricultural society was formed. During a residence in England, he made himself intimately acquainted with the political organisation of the country, and also with its industrial institutions; knowledge of which he made good use on his return to his own country in 1842. In conjunction with Count Cesare Balbo, he in 1847 established a political daily journal, in which he advocated the interests of the middle classes—a representative system, somewhat after the pattern of the English constitution, as opposed alike to absolutism on the one hand, and mob rule on the other. On his suggestion, the king was petitioned for a constitution, which was granted in February 1848. As a member of the Chamber of Deputies, during the stormy period which succeeded Charles Albert's declaration of war against Austria in March, C. strenuously opposed the ultra-democrats, and counselled an alliance with England as the surest guarantee for the success of the Italian arms. In the Marquis d'Azeglio's ministry, formed soon after the fatal battle of Novara, C. was successively Minister of Agriculture and Commerce, Minister of Marine, and Minister of Finance; and in 1852 he was appointed to succeed D'Azeglio as premier. From this time until his resignation in 1859, in consequence of the conclusion of the peace of Villafranca, C. was the originator as well as the director of the Sardinian policy. Taking upon himself at different times, in addition to the premiership, the duties of the Ministers of Finance, Commerce, and Agriculture, and latterly of Home and Foreign Affairs, he greatly improved the financial condition of the country, introduced free-trade, consolidated constitutionalism, weakened clerical influence, and made Sardinia a power of some account in Europe, by bringing her into alliance with England and France against Russia. The dispatches which C. penned in reply to those of Austria, prior to the outbreak of the Italian war, are on all hands acknowledged as master-pieces of astute diplomacy. In January 1860, C. was again called upon to preside over the Sardinian

government, the duties of Foreign Minister likewise devolving upon him, and temporarily those of the Minister of the Interior also. He continued to direct the Sardinian policy until his death, June 1861.

**CA'VY** (*Cavia*), a genus of quadrupeds of the order Rodentia, regarded as the type of a family, *Carida*, differing from the Hare family (*Leporidae*) in the complete want of clavicles, in the want of growing roots to the molar teeth, and in having the incisors situated as in other quadrupeds generally, and not in the peculiar manner so characteristic of the hares. There are four molar teeth in each jaw, and in the genus *C.* these are compound; and the genus is further characterised by four toes on each of the fore-feet, and three on each of the hind-feet, by the feet not being webbed, by the females having only two teats, and by the want of a tail. One species, *Cavia Cobaya*, has been long well known as a domesticated animal, and has been a common pet and plaything of children in Europe, almost from the time of the discovery of America. It is sometimes called the COMMON C. or RESTLESS C., but much more frequently receives the name of GUINEA-PIG, although it is neither nearly related to pigs, nor a native of Guinea. Perhaps *Guinea*, in this name, may be a corruption of *Guisana*, the cavies, and indeed the whole family of the *Caridae*, being exclusively South American. The colours which the domesticated C. exhibits have never been seen in any of the wild cavies of South America; and as it is known to have exhibited the same variations of colour from about the time of its introduction into Europe, it is supposed to have been long domesticated by some of the South American tribes. The Guinea-pig multiplies with a rapidity exceeding that of any other known quadruped, producing young ones when only two months old, and afterwards at intervals of two

Cavy, or Guinea-pig.

months, and from four to twelve in a litter. This extraordinary fecundity is probably not so much the result of domestication, as a provision for the preservation of the race in a wild state, the little animal being very defenceless and destitute of means of escape, the ready prey of every carnivorous beast and bird.—The other species of *C.* much resemble the Guinea-pig. Some of them are very numerous in some parts of South America, and are sought for food, although no such use is made of the domesticated cavy. The Agouti (q. v.) and the Cavybara (q. v.) are ranked among the *Caridae*.

**CAWK**, a popular name for a massive variety of the mineral called Heavy Spar or Sulphate of Baryta. See **BARYTA**.

**CAWNPORE**, a city of the Doab, on the right bank of the Ganges, about 140 miles above Allahabad, at the junction of the Jumna, being separated by the river from Oude, whose capital, Lucknow, lies 53 miles to the north-east. The lat. is 26° 29' N., and the long. 80° 25' E. The stream in front, varying, according to the season, from 500 yards in width to more than a mile, presents a large

## CAWNPORE—CAZEMBÉ.

and motley assemblage of steam-vessels and native craft. C., at least as a place of note, is of recent origin, being indebted for its growth, besides its commercial facilities, partly to military and political considerations. In 1777, being then an appendage of Oude, it was assigned by the nawab as the station of a subsidiary force; and in 1801 it became, in name as well as in fact, British property. Its cantonments, having accommodation for 7000 troops, gradually accumulated about 50,000 native inhabitants; while the city itself contained a somewhat larger population of similar origin. During the mutiny of 1857, C. was the scene of Nana Sahib's massacre of his English captives. Though C. is only 379 feet above the sea, yet, during winter, considerable quantities of ice are made for preservation, through the exposing of water by night in shallow vessels. Pop. (1871) 113,601.

CAWNPORE, the district of the above-described city, in the lieutenant-governorship of the Northwest Provinces. Occupying the entire breadth of the Doab, it touches at once the Jumna and the Ganges; while to the eastward it has Futtahpore, and, to the westward, Etawah and Furrucksabad. With a pop. in 1871 of 1,155,439, it has an area of 2353 square miles, stretching in lat. from 25° 55' to 27° N., and in long. from 79° 34' to 80° 37' E. It is an alluvial plain of great fertility. The vine is cultivated, and indigo grows wild. Besides its two mighty rivers and their navigable tributaries, the Ganges Canal traverses the country for about 60 miles.

CAXAMARCA, a province of Libertad, the most north-westerly department of Peru, with a capital of its own name. It is on the east side of the Andes, forming part of the basin of the Maranon. The province has 273,000 inhabitants, and the city about 12,000.

CAXAMARQUILLA, a town of Pataz, a province in the same department as Caxamarca. The whole of Pataz, with a population of 29,324, lies on the east bank of the Maranon.

CAXATA'MBO, a province of Ancas, the department immediately to the south of Libertad, above mentioned, with a capital of its own name. It contains 24,799 inhabitants.

CAXTON, WILLIAM, who introduced printing into England, was born in the Weald of Kent, about 1412. The particulars of the life of this great benefactor of his country are scanty. He was apprenticed to a mercer, and after his death in 1441, C. appears to have proceeded to the Low Countries, with a view to trade, either on his own account or as agent for some English merchants. His knowledge of trade must have been considerable, for in 1454 he was employed, along with Richard Whitehill, to 'continue and confirm a treaty of trade and commerce between Edward IV. and Philip, Duke of Burgundy,' with power to conclude a new one if necessary. In the Low Countries, he seems to have learned the art of printing. The first book he printed was Raoul le Fevre's *Recueil des Histoires de Troye*; the next work from his press was the *Oration of John Russell on Charles, Duke of Burgundy, being created a Knight of the Garter*; and the third, C.'s own translation of Raoul's work, completed at the request of Margaret, Duchess of Burgundy, in whose household C. for some time resided, in what capacity is not known. The last-mentioned work was probably printed in 1471; the date of the others is uncertain. The same uncertainty attaches to the time of his return to his own country, but it is known that he had established himself as a printer in Westminster before the year 1477. The first

book issued from his press here was the *Game and Playe of the Chess*. All C.'s works are printed in what is called Black Letter (q. v.). The types he at first employed resembled those in use in the Low Countries, much more than the finer specimens of the Venetian, Roman, and Parisian presses. C. had a good knowledge of German, French, and Dutch, and was the translator of several of the works that he printed; among others, of *The Hystorye of Reynart the Foxe*.

CAYENNE, a term of various application in French Guiana, a territory on the left or north side of the estuary of the Amazon. 1. A river entering the Atlantic in lat. 4° 56' N., and long. 52° 20' W.—2. An islet of 30 miles in circuit at the mouth of the said river. It has a population of about 8000—about 5000 of them being emancipated slaves.—3. A city at the north-west point of the said islet, with a shallow harbour, which is defended by batteries. It contains nearly two-thirds of the above-stated population, and is the only town of note in the country.—4. One of the two districts of the colony, or popularly, in fact, the colony itself, is a place of exile for political offenders.

CAYENNE CHERRY. See EUGENIA.

CAYENNE PEPPER consists of the powder of the dried pods, and more especially of the dried seeds of different species of CAPSICUM (q. v.), particularly of *C. frutescens*.

CAY'MAN, a name somewhat variably used, either as the distinctive appellation of some, or as a common name for all the *Crocodiliidae* of South America. See ALLIGATOR. The genus *Alligator* is by some naturalists of the present day divided into three genera, to one of which the name *C. (Caiman)* is appropriated, and of which the type is the species called the Eye-browed C. (*Alligator palpebratus*), to which the name *C.* is distinctively applied in Surinam and Guiana, a species very abundant there, but not one of the largest or more dangerous of its tribe. It is remarkable for the three bony plates, separated by sutures only, which form each eyebrow or eyelid, projecting as large knobs like a man's fist; and this, and the scarcely webbed-feet, constitute the most important characters of the genus or sub-genus Cayman. To this sub-genus belong also *A. trigonatus*, regarded by Cuvier as a mere variety of the same species, and *A. gibbiceps*.

CAYMAN'S—in English, *Alligators*—three low islets of the Caribbean Sea, which form a dependency of Jamaica, being 130 miles to the north-west of it. Discovered by Columbus, they were by him called Tortugas, from the abundance of turtle—still the staple production of the group. On an area of about 2000 acres, the population does not exceed 200 or 300. The soil yields corn and vegetables; and the people rear hogs and poultry.

CAZA'LLA DE LA SIE'ERRA, a town of Spain, in the province of Seville, 39 miles north-east of the city of that name. It is situated on a declivity of the Sierra Morena; the district around is mountainous and well wooded, and abounds in minerals of various kinds, including iron, silver, copper, sulphur, and marble. The inhabitants, numbering between 7000 and 8000, are chiefly employed in smelting metals, manufacturing cannon, machinery, and agricultural implements. Some tanning, weaving, &c., are also carried on.

CAZE'MBÉ, or KAZEMBE, an important country of Africa, the limits of which have not been clearly determined, but its centre has been fixed at about lat. 12° S., and long. 31° E. The king's rule extends over a great portion of the established

route across the continent of Africa, from the Congo, up the valley of Lulúa, and down the valley of Luapila. Vegetation is generally luxuriant. Its chief products are manioc, maize, salt, copper, iron, and ivory. The people are called Balonda or Baloi.

CAZO'RLA, a town of Andalusia, Spain, 40 miles east-north-east of Jaen. C., which is a place of considerable antiquity, is pleasantly situated on a declivity, and is well watered by the Vega; has two old castles—one an Arab structure—manufactures of leather, earthenware, soap, and bricks, and a trade in agricultural produce. Pop. 7500.

CEANO'THUS. See RED Roor.

CEARA, a province of Brazil, on the north coast, situated in lat.  $2^{\circ} 40'$ — $7^{\circ} 25'$  S., long.  $37^{\circ} 40'$ — $41^{\circ} 30'$  W. It has an area of at least 50,000 square miles, with (1867) 550,000 inhabitants. It abounds in balsams, gums, resins, and fruits; and among its minerals are gold, iron, copper, and salt.

CEBADI'LLA. See SABADILLA.

CEBUS (Gr. an ape or monkey), a genus of American monkeys, characterised by a round head and short muzzle, a facial angle of about  $60^{\circ}$ , long thumbs, and a long prehensile tail entirely covered with hair. The species are numerous, all of very lively disposition and gregarious habits, living in trees. They feed chiefly on fruits, but also on insects, worms, and mollusks. They are included under the popular designation SAPAJOU in its wider sense, and some of them are the monkeys to which this name is sometimes more strictly appropriated. The names SAJOU and SAI are also given to some of them, and some are called Capuchin (q. v.) monkeys. One of the most common species in Guiana is the WEEPER MONKEY, or WEEPER SAPAJOU (*C. Apella*).—The name Capuchin is perhaps most frequently given to *C. Capuchinus*, a brownish species, with head, feet, and hands generally black, and front, shoulders, and cheeks whitish.—Some of the species of *C.* are adorned with beards.—The name *Cebidae* is sometimes given to the American monkeys collectively, as a family or tribe. See MONKEY.

CECIDOMYIA (Gr. *ketidion*, a gall-nut; and *myia*, a fly or gnat), a genus of dipterous (two-winged) insects of the family *Tipulariae*—the gnat and mosquito family; having downy wings, which have three nervures, and are horizontal when at rest; antennæ as long as the body, with bead-like joints, and whisks of hairs at the joints; long legs, and the first joint of the tarsi very short. The species are numerous; nearly thirty are British. All are of small size, but some of them are very important on account of the ravages which their maggots effect in grain-crops. *C. cerealis*, sometimes called the Barley Midge, a brownish-red fly with silvery wings, of which the maggot is vermillion-coloured, is often very destructive to crops of barley and spelt in Germany. The little maggots live in families between the stalk and the sheath of the leaf, abstracting the juice of the plant.—The WHEAT-FLY (q. v.) and the HESIAN FLY (q. v.) belong to this genus.—Some of the species of *C.* deposit their eggs on the young buds of trees, which the larvae transform into galls.

CECIL, WILLIAM, LORD BURLEIGH, one of England's greatest statesmen, was born at Bourne, Lincolnshire, September 15, 1520. Educated at the grammar-schools of Grantham and Stamford, he thence passed to St John's College, Cambridge, where he was remarkable alike for his diligence and aptitude in learning. Entering Gray's Inn at the age of 21, he devoted himself assiduously to the

study of law. History, genealogy, and theology also formed part of his studies at this time; and his knowledge of the last recommended him to the notice of Henry VIII., who presented him with the reversion of the *custos breviarum*, an office of value in the Common Pleas. An alliance with the daughter of Sir Anthony Cook procured him the friendship of the Protector Somerset, who, in 1547, appointed him Master of Requests; and in the following year his great talents procured for him the office of secretary of state. He shared in the disgrace of Somerset, even to imprisonment for three months; but in less than two years after his release, his pre-eminent abilities secured for him a re-appointment to the state secretaryship by the Duke of Northumberland, his former patron's sworn enemy. During his second secretaryship, C. effected most important and beneficial changes in the commercial policy of the country. With a sagacity far beyond the spirit of his age, he endeavoured to throw trade open, and did succeed in abolishing some monopolies; but others proved too strong for him, standing as he did alone, at a time when exclusive privileges were considered the only sureties of a profitable trade. When Queen Mary ascended the throne, C., being a Protestant, resigned his official employment, because he could not conscientiously serve a Roman Catholic court; but as a private gentleman he maintained good relations with the Roman Catholic party, and was one of the few eminent Protestants who escaped in purse and person during that short but infamous reign. His freedom from persecution has given rise to the charge, that he was a 'trimmer'—a very unjust accusation, indeed. C. was naturally cautious and politic, and averse to extremes in religion; but though he took no part in bitter sectarian discussions, he never belied his conscience, and to him is mainly owing the rejection of the bill which the Roman Catholics had introduced into parliament with the view to a wholesale confiscation of the estates of Protestants. Prior to Mary's death, C., foreseeing her end, had entered into correspondence with Elizabeth, who, on her accession to the throne (November 16, 1558), at once recognising C.'s capacity for government, appointed him secretary of state. A biography of C. from this time until his death would be a forty years' history of England, for he was alike the originator and director of that policy which, hitherto, has made Elizabeth's reign memorable above that of any other English sovereign; for although Elizabeth occasionally, in her caprice, favoured other courtiers, C. was the statesman whose judgment she relied on in all matters of consequence. His policy at home and abroad was at once shrewd and cautious, and also liberal and comprehensive, while he displayed a power of decision, ready and stern, when necessity demanded. As a statesman, C. was above animosities and favouritism; his enemies never suffered, and his friends profited nothing, by his power. Capacity, truth, and honour were what he sought in public men. Had he been less just, history might have been more generous to his memory. The queen created him Baron Burleigh in 1571, and conferred on him the Order of the Garter in the succeeding year, when he was also made lord high treasurer, an office he held until his death, August 15, 1598.

CECIL, ROBERT, EARL OF SALISBURY, son of the above, was born about 1550. On the death of his father, having previously held important state offices, he succeeded to what would now be called the premiership. On the accession of James I., C., who had carried on a private correspondence with that monarch before Elizabeth's death, was confirmed in

his office, and received many high honours, culminating in that of Earl of Salisbury. In 1608, he was made lord high treasurer, and the Exchequer was greatly improved in his hands. C. was a man of immense energy and far-reaching sagacity, undoubtedly the best minister the country had in his time; but he was cold, selfish, and unscrupulous as to the means he took to gain his ends, and get rid of his rivals. His connection with the disgrace of Essex and Raleigh laid him open to great and deserved odium, in the latter case especially. Like his father, however, he was free from the meanness and dishonesty of enriching himself out of the public money. He died May 24, 1612.

CECILIA, St, the patroness of music, is said to have suffered martyrdom in 230 A.D. Her heathen parents, as we are told, belonged to a noble Roman family, and betrothed their daughter, who had been converted to Christianity, to a heathen youth named Valerian. This youth and his brother Tiberius became Christian converts, and suffered martyrdom. C., when commanded to sacrifice to idols, firmly refused, and was condemned to death. Her persecutors, it is said, first threw her into a boiling bath, but on the following day they found her unburnt. The executioner next attempted to cut off her head, but found it impossible. Three days later, she died —rather a lame conclusion to such miraculous interference! As early as the 5th c., there is mention of a church dedicated to her at Rome; and in 821, by order of the Pope Paschal, her bones were deposited there. St C. is regarded as the inventor of the organ, and in the Roman Catholic Church her festival-day, November 22, is celebrated with splendid music. Chaucer, Dryden, and Pope have celebrated St C., and the painters Raphael, Domenichino, Dolce, and others have represented her in fine pictures. —Another St C. was born in Africa, and suffered martyrdom by starvation under Diocletian. The Roman Catholic Church celebrates her festival on the 11th of February.

CECROPIA, a genus of trees of the natural order *Artocarpaceæ*. *C. pellata*, a native of the West Indies and of South America, sometimes called Trumpet-wood and Snake-wood, is remarkable for its

hollow stem and branches, exhibiting merely membranous partitions at the nodes. The small branches, these partitions being removed, are made into wind-instruments. The wood is very light, readily takes fire by friction against a harder piece of wood, and is much used by the Indians for procuring fire in this way. The fruit is agreeable, and resembles a raspberry. Both the trunk and branches yield a large quantity of saline matter, which is employed by the French planters in the purification of sugar. The bark is strong and fibrous, and is much used for cordage. It is also astringent, and is applied in diarrhoea and other diseases.

CECROPS, the first king of Attica, figures in Greek mythology as an Autochthon (q. v.), half-man and half-dragon. Belonging, as he does, to the prehistoric ages of Greece, his real character can only be guessed at. Tradition declared him to be the founder of marriage, the author of the political division of Attica into twelve states, and the introducer of agriculture, of navigation, and commerce. He is also said to have civilised the religious rites of the people. The name C. is given to various towns in Greece, and the legends in general seem to indicate a Pelasgic origin for the hero. The later accounts, that he came from Sais in Egypt, have no historic basis.

CEDAR, or CEDAR OF LEBANON, a tree much celebrated from the most ancient times for its beauty, its magnificence, and its longevity, as well as for the excellence and durability of its timber. It is often mentioned in Scripture; it supplied the wood-work of Solomon's temple; and in the poetry of the Old Testament it is a frequent emblem of prosperity, strength, and stability. It belongs to the natural order *Coniferae*, and is the *Pinus Cedrus* of the older botanists; but is now ranked in the genus *Abies* (see FIR), in the genus *Larix* (see LARCH), by those who make *Larix* a distinct genus from *Abies*, or is made the type of a genus, *Cedrus*, distinguished from *Larix* by evergreen leaves and carpels separating from the axis, and receives the name of *C. Libani*.

Of the celebrated CEDARS OF LEBANON, only a few now remain. They consist of a grove of some

Cedars of Lebanon.

400 trees, about three-quarters of a mile in circumference, partly old trees, and partly young ones. Learned travellers think that most of the trees in the grove may be 200 years old, and several between the ages of 400 and 800 years. There are twelve trees whose age is incalculable—seven standing very near each other; three more a little further on, nearly in a line with them; and two, not observed by any recent traveller except Lord Lindsay, on the northern edge of the grove. The largest of these two is 63 feet in circumference—following the sinuosities of the bark; one of the others measures 49 feet.

These trees are more remarkable for girth than stature, their height hardly exceeding 50 feet. Their age is variously estimated; the rules by which botanists determine the age of trees are not applicable to them, for their stems have ceased to grow in regular concentric rings; they owe their prolonged existence to the superior vitality of a portion of their bark, which has survived the decay of the rest. Russegger is inclined to admit that these trees may possibly number some 2000 years.

The Arabs, of all creeds, have a traditional veneration for these trees; they believe that an evil fate would surely overtake any one who shall dare to

lay sacrilegious hands on the saints, as they fondly call them. Every year, at the feast of the Transfiguration, the Maronites, Greeks, and Armenians mount to the cedars, and celebrate mass on a homely altar of stone at their feet.

The C. has been planted in parks in many parts of Europe; it was introduced into England in the latter part of the 17th c., and a tree at Sion House, London, is now eight feet in diameter at three feet above the ground. Even in Inverness-shire it succeeds so well, that trees at Beaufort Castle, the seat of Lord Lovat, planted in 1783, are now three or four feet in diameter. On its native mountains, the C. is found at the base of the highest peaks, at an altitude of about 8000 feet above the sea. It seems to delight in a dry open soil, where, however, its roots can have access to abundance of water. Although in foliage and some other particulars the C. considerably resembles the common larch, it differs in form and habit very widely both from the larch and from the pines in general. Its stem bears almost down to the ground irregularly placed

branches, often of prodigious size and expanse, which divide irregularly into branchlets. The leaves are dark green, 10—15 lines long, pointed, united in clusters of 20—30: on the young shoots they are very numerous, and not in clusters; the small branchlets also are crowded together and pen-sile. The cones are erect, oval, broadly rounded at both ends, about four inches long, and three inches in diameter; their scales closely crowded, large, and broad. The cones take two years to

come to maturity, and hang on the tree for years before their scales come off and their seeds are set free. The wood of the trunk is reddish, and full of a fragrant resin. The ancients kept their writings in cabinets or boxes of cedar-wood. Extraordinary indestructibility and other virtues were ascribed to it. It is not nearly so much prized at the present day, because it is soft and light, and apt to crack in drying. This inferiority is, however, not improbably owing to the inferior age of the trees from which the timber is now procured. A resinous substance, called *Cedar Resin*, or *Cedria*, flows spontaneously from the trunk of the C., or from incisions; it resembles mastic, and was anciently used along with other resins in the embalming of the dead. It was also used as a medicine. In very ancient times, C. Oil, a kind of turpentine, was prepared from the wood, and was spread on books in order to their better preservation. At the present day, the oil and the resin are scarcely known. The branches of the C., like those of the larch in warm countries, exude a sweet substance, which is known by the name of C. MANNA.—The DEODAR, or HIMALAYAN C. (*Cedrus Deodara*), a tree held in great veneration by the Hindus, and of which the name is said to be properly *Devadara*, and to signify *god-tree*, is common in the Himalaya mountains, at elevations of 7000—12,000 feet, forming magnificent forests, and attaining a great size, a height sometimes of 150 feet, with a trunk 30 feet or more in circumference, an ample head, and spreading branches. It is described as having cones somewhat larger

than those of the C. of Lebanon, the scales of the cones falling off as soon as the seed is ripe, and as differing from the C. of Lebanon also in more pen-sile branches and longer leaves; but Dr Hooker expresses a strong opinion that they will prove to be really the same species, as well as the C. of ALGIERS (*C. Atlantica* or *Africana*), which is found in the mountainous regions of the north of Africa. The wood of the deodar is resinous, fragrant, compact, and very durable. It is susceptible of a high polish, and in its polished state has been compared to brown agata. Owing to the abundance of resin, laths of it burn like candles. Its turpentine is very fluid, and although coarse, is much used in India for medical purposes; and tar and pitch are obtained from the trunk. The deodar has now become very common as an ornamental tree in Britain, although few specimens have yet attained a very considerable size. On account of its extreme gracefulness when young, it is often planted in situations to which large trees are unsuitable, and is to be seen in many suburban parterres.—The name C. is often given to other coniferous trees besides the true cedars. Thus, the Siberian Stone Pine, or *Cembra* Pine, is called the SIBERIAN C. (see PINE), and a species of fir (*Abies religiosa*) is the RED C. of California (see FIR). A species of Cypress (q. v.) is known as WHITE C., and another as the C. of GOA. Several of the trees which bear the name C. are species of Juniper (q. v.), among which are the VIRGINIAN C., or RED C. of North America, and the BERMUDA C.—which yield the cedar-wood used for pencils—the SPANISH C. of the south of Europe, &c. The name C. is even given to trees which have no resemblance to the true cedar, except in the resinous quality of the wood; thus the Cedar-wood of Guiana is produced by *Icica altissima*, a tree of the natural order *Amyridaceae* (q. v.); the C. of the West Indies (see next article) belongs to the natural order *Cedrelaceae*; and the name BASTARD C. is given in India to a tree of the natural order *Byttneriacae* (q. v.).

CEDAR, BARBADOES (*Cedrela odorata*), a tree of the natural order *Cedrelaceae* (q. v.), and of the same genus with the toon of India, a native of the West Indies and warm parts of America. It is simply called Cedar in the West Indies. It is often upwards of eighty feet high, with a trunk remarkable for thickness. It has panicles of flowers resembling those of the hyacinth. The fruit, bark, and leaves have the smell of asafoetida, but the wood has an agreeable fragrance. Being soft and light, it is used for canoes, and for shingles. Havannah cigar-boxes are very generally made of it. In France, it is used in making black-lead pencils.

CEDAR BIRD. See WAXWING.

CEDAR MOUNTAINS, a range of the Cape Colony, parallel with the Atlantic, and nearly half-way between it and the dividing ridge of the country. They form the height of land between the Oliphant on the west, and the Great Thorn, its principal tributary, on the east, varying in altitude from 1600 feet to 5000. They lie about lat. 32° S., and long. 19° E., in the division of Clanwilliam, and supply the village of that name with cedar planks.

CEDRATE. See CITRON.

CEDRELACEAE, a natural order of exogenous plants, very nearly allied to *Meliaceae* (q. v.), and chiefly distinguished by the winged seeds, numerous in each cell of the fruit, which is a capsule. The known species are few, all tropical or sub-tropical trees or shrubs, with pinnate leaves, most of them trees valuable for their timber. To this order belong mahogany, satin-wood, toon, Barbadoes cedar, the yellow-wood of New South Wales, &c. The barks

Cone of Cedar of Lebanon.

of some species are febrifugal. That of *Soymida febrifuga*, the Rohuna or East Indian Mahogany, has been imported into Britain as a medicine.

CEFALU', a town of Sicily, on the north coast, 47 miles east-south-east of Palermo. It is situated at the foot of a rock, and is surrounded by old walls. It has a cathedral, and the ruins of a Saracenic castle occupy a neighbouring hill. As a seaport, it has little traffic. The inhabitants, numbering some 10,000, are chiefly engaged in fishing.

CEHEGIN', a town of Spain, in the province of Murcia, 37 miles west-north-west of the city of that name. It has some spacious streets with handsome buildings, and manufactures of paper, cloth, and pottery. Pop. about 10,000.

CEILING (Fr. *cic*; Lat. *cælum*, heaven). This term seems to have been suggested by the use of arched coverings for churches, and even for rooms, which prevailed in the middle ages, and was not unknown to the Romans. Whether the term was further suggested by the habit of tinting ceilings of a blue colour, and decorating them with stars, or whether that usage arose from the use of the term already introduced, is more doubtful. Arched ceilings among the Romans were known by the name *camera* or *camera*, the Greek origin of which seems to furnish an argument in favour of the view that the arch was known to the latter people. The camera was formed by semicircular beams of wood, at small distances from each other, over which was placed a coating of lath and plaster. In later times, the cameras were frequently lined with plates of glass; whence they were termed *vitræ*. But the ceilings most commonly in use amongst the Romans were flat, the beams, as in modern times, having been at first visible, and afterwards covered with planks and plaster. Sometimes hollow spaces were left between the planks, which were frequently covered with gold and ivory, or paintings. The oldest flat C. in existence is believed to be that of Peterborough Cathedral. Like that at St Albans Abbey, it is made of wood, and plastered over like a modern ceiling. Ceilings of churches, in the middle ages, were generally painted and gilded in the most brilliant manner; and many existing ceilings still exhibit the traces of early decoration of this kind. The older ceilings generally follow the line of the timbers of the roof, which, in the Early English and Decorated, are often arranged so as to give the shape of a barrel vault. In ceilings of this description there are seldom many ribs, often only a single one along the top. In the perpendicular style, the C. often consists of a series of flat surfaces or cants, formed on the timbers of the roof. Though sometimes altogether destitute of ornament, they are more frequently enriched with ribs, dividing them into square panels, with bosses (q. v.) or flowers at the intersections. Wooden ceilings are sometimes formed in imitation of stone-groining, with ribs and bosses, examples of which will be found at York, Winchester, and Lincoln. In the Elizabethan age, ceilings were generally of plaster, but they were ornamented with ribs having bosses or small pendants at the intersections. It is not unusual for the C. immediately over the altar, or the roodloft, to be richly ornamented, whilst the rest is plain.

CELANDINE (*Chelidonium*), a genus of plants of the natural order *Papaveraceæ* (the Poppy family), having a corolla of four petals, and a podlike capsule. The common C. (*C. majus*) is a perennial, with pinnate leaves, lobed leaflets, and yellow flowers in simple umbels, frequent under hedges, in waste places, &c., in Britain and most parts of Europe. It flowers from May to September. The

root, stem, and leaves, when fresh, have a disagreeable smell, and are full of a yellow juice, which is

Common Celandine.

very acrid, causing inflammation when applied to the skin. C. is sometimes used in medicine: it is a drastic purgative, and in large doses an active poison; in small doses it is said to act beneficially on the lymphatic system and on the organs of secretion, and to be useful in scrofulous diseases, disease of the mesenteric glands, &c. The fresh juice, applied externally to warts, corns, &c., removes them by stimulating them beyond what their languid vital powers can bear. Mixed with milk, it is applied to the eye for the cure of opacities of the cornea, but is a remedy that requires great caution in its use.

CELA'NO, LAKE OF. See FUCINO, LAKE OF.

CELASTRA'CÆ. See SPINDLE-TREE.

CELEBES, a large island of the Asiatic Archipelago, lying to the east of the south half of Borneo. It stretches between lat. 1° 50' N. and 5° 30' S., and in long. between 119° and 125° E., its extreme dimensions thus being fully 500 and 400 miles; and yet it is so irregular in form—branching eastward into four peninsulas from a common root on the west—that it does not contain a single spot which is more than 50 miles from the sea. It has, for nearly 200 years, been colonised by the Dutch, whose possessions number 279,000 inhabitants, about one-sixth of what is estimated to be the entire population. The rest of the island is divided into 13 separate principalities, peopled by distinct races in very different stages of civilisation. Mountains abound, rising, at one point, to an elevation of 7000 feet; and, as is the case with the archipelago as a whole, some of them are volcanic. The minerals are gold, iron, and salt. Besides the ordinary tropical productions, C. has extensive pastures, with excellent breeds of horses and cattle. Between 1811 and 1816, the Dutch settlements were held by the British. The chief town is Macassar, which gives name to the strait between C. and Borneo.

CELERY (*Apium*), a genus of plants of the natural order *Umbellifera*, distinguished by a mere rudimentary calyx, roundish entire petals, very short styles, and roundish fruit. The common C. (*A. graveolens*) is found wild in Britain and most parts of Europe,

## CELESTINE—CELIBACY.

in ditches, brooks, &c., especially near the sea and in saline soils. Its leaves are dark green and smooth, its petals involute at the tip. The wild plant, also called **SMALLAGE**, has a stem about two feet high, a tapering slender root, a penetrating offensive odour, a bitterish acrid taste, and almost poisonous qualities. By cultivation, it is so much changed that its taste becomes agreeably sweetish and aromatic, whilst either the leaf-stalks much increase in thickness, or the root swells in a turnip-like manner. These parts, blanched, are much used as a salad, or to impart flavour to soups, &c., and sometimes as a boiled vegetable. They contain sugar, mucilage, starch, and a substance resembling manna-sugar, which acts as a stimulant, particularly on the urogenital organs, so that a very free and frequent indulgence in the use of C. cannot, in ordinary circumstances, be altogether favourable to health. Two principal varieties of C. are cultivated, that most common in Britain having long thick leaf-stalks, which are more or less tubular, sometimes almost solid, and, after blanching, either white or more or less tinged with red; whilst the other, called **TURNIP-ROOTED C.**, or **CELERIAC**, is chiefly remarkable for its swollen turnip-like root, and is in most general cultivation on the continent of Europe. The 'red' varieties of C. are esteemed rather more hardy than the 'white.' The blanching of the leaf-stalks is generally accomplished by drawing up earth to the plants, which are transplanted from the seed-bed into richly manured trenches; and as they grow, the trenches are filled up, and the earth finally raised into ridges, above which little more than the tops of the leaves appear. C. is thus obtained for use throughout the winter. In the northern parts of Britain, the seed is generally sown on a hotbed. C. seed is often used for flavouring, when the leaf-stalks cannot be obtained.—Another species of C. (*Apyium australe*) grows abundantly in wet places on the shore about Cape Horn and in Staten Island. It is a large, hardy, and luxuriant plant, and is described as wholesome and very palatable, nearly equal in its wild state to our garden-celeri. It seems well worthy of the attention of horticulturists.

**Celestine**, a mineral bearing the same relation to strontia (q. v.) that heavy spar bears to baryta. It is essentially sulphate of strontia ( $\text{SrSO}_4$ ), with occasional admixture of sulphate of baryta, carbonate of lime, oxide of iron, &c., in small proportions. It much resembles heavy spar, but is not quite equal to it in specific gravity; it usually blue, often of a very beautiful indigo-blue; sometimes colourless, more rarely reddish or yellowish. Its crystallisation is rhombic, like that of heavy spar. Most beautiful specimens of crystallised C. are found in Sicily. C. derives its name from its colour. It is used as a source of strontia.

**Celestines**, an order of hermits of St Damiana, founded by Peter de Morrone about 1264, and confirmed as a monkish order by Urban IV. in 1264 and 1274. They called themselves C. when their founder ascended the papal chair under the name of Celestine V. They are regarded as a branch of the great order of St Benedict, whose rule they follow; they wear a white garment with black hood and scapulary, and live a purely contemplative life. In the 13th and 14th centuries, the order rapidly spread through France, Italy, and Germany, but subsequently decayed. The French C. were secularised by order of Pope Pius VI. in 1776—1778; so also were the Neapolitan Celestines. In the present day, the order is almost extinct.

**Celibacy**, from Lat. *celibis*, unmarried. Notwithstanding the divine commendation of marriage

given in the Jewish Scriptures (Gen. i. 28), the opinion had become prevalent, even before the time of Christ, that C. was favourable to an intimate union with God. This notion took its origin in the wide-spread philosophy of a good and an evil principle. The body, consisting of matter, the seat of evil, was looked upon as the prison of the pure soul, which was thought to be defiled by bodily enjoyments. Among the Jewish sect of the Essenes, accordingly, a life of C. was held to be the chief road to sanctity. These ascetic views naturally led, in the first place, to the disapproval of second marriages. While, therefore, in the first Christian churches, every one was left at liberty to marry or not as he thought fit, the objection to those who married a second time had become so generally spread, that the Apostle Paul saw occasion to counsel such Christian converts as were in widowhood to remain so.

By the 2d c., however, the unmarried life generally had begun to be extolled, and to be held necessary for a life of sanctity, although several, at least, of the apostles themselves had been married. Two passages of Scripture (1 Cor. vii. and Rev. xiv. 4) were specially cited as proving that C. was the genuine condition of a Christian; and with the platonising Fathers of the 2d and 3d centuries, the unmarried of both sexes were held as standing higher than the married. Accordingly, although there was no express law against the marriage of the clergy, many, especially of the bishops, remained unmarried; a second marriage was, in their case, already strictly prohibited.

As the bishops of Rome rose in consideration, and gradually developed a firmer church government, they called upon all who belonged to the clerical order to live for the church alone, and not marry. This requirement met with constant resistance; still, it became more and more the custom, in the 4th c., for the higher clergy to refrain from marriage, and from them it went over to the lower orders and to the monks. Provincial synods now began expressly to interdict the clergy from marrying. The council of Tournai (566) suspended for a year all secular priests and deacons who were found with their wives; and the Emperor Justinian by an edict declared all children born to a clergyman, after ordination, to be illegitimate, and incapable of inheritance. There were still, however, many married priests who resisted the law, and found encouragement in the opposition which the Greek Church made to that of Rome in this matter of celibacy. The council held at Constantinople in 692, declared, in opposition to the Church of Rome, that priests and deacons might live with their wives as the laity do, according to the ancient custom and ordinance of the apostles. The orthodox Greek Church has continued to adhere to this decision. Priests and deacons in that church may marry before ordination, and live in marriage after it; but they are not allowed to marry a second time. However, only a priest living in C. can be chosen as bishop or patriarch.

The Church of Rome continued its endeavours to enforce the law of C.; though, for several centuries, they were attended with only partial success. There still continued to be numbers of priests with wives, although the councils were always issuing new orders against them. Pope Leo IX. (1048—1054) and Nicolas II. (1058—1061) interdicted all priests that had wives or concubines from the exercise of any spiritual function, on pain of excommunication. Alexander II. (1061—1073) decreed excommunication against all who should attend a mass celebrated by a priest having a wife or concubine. This decision was renewed by Gregory VII. in a council held at

Rome in 1074, and a decretal was issued that every layman who should receive the communion from the hands of a married priest should be excommunicated, and that every priest who married or lived in concubinage, should be deposed. The decree met with the most violent opposition in all countries; but Gregory succeeded in carrying it out with the greatest rigour; and though individual instances of married priests were still to be found in the 12th and 13th centuries, the C. of the Roman Catholic clergy was established, and has since continued both in theory and practice.

The violence thus done to human nature did not fail to avenge itself in those rude times. The licentiousness and corruption of the priests and monks became in many cases boundless, and it was in vain that strict individuals, as well as councils, strove against it. The immorality and debasement of the clergy became a reproach and by-word in the mouth of the people, and gave a powerful impulse to the religious movement that began in the 16th century. The leading Reformers declared against the C. of the clergy as unfounded in Scripture, and contrary to the natural ordinance of God, and Luther set the example of marrying. This was not without effect on the Roman Catholic clergy, and the question of the abolition of C. was raised at the council of Trent (1563). But the majority of voices decided that God would not withhold the gift of chastity from those that rightly prayed for it, and the rule of C. was thus finally and for ever imposed on the ministers of the Roman Catholic Church. Those who have only received the lower kinds of consecration may marry on resigning their office. For all grades above a subdeacon, a papal dispensation is necessary. A priest that marries incurs excommunication, and is incapable of any spiritual function. If a married man wishes to become a priest, he receives consecration only on condition that he separate from his wife, and that she of her free will consent to the separation and enter a religious order, or take the vow of chastity. The priests of the united Graeco-Catholic congregations in Rome have received permission from the popes to continue in marriage, if entered into before consecration, but on condition of always living apart from their wives three days before they celebrate mass.

Notwithstanding these decisions, the contest against clerical C. has again and again been resumed, in recent times, both within and without the Roman Catholic Church. In fact, all attempts at innovation within the bosom of Catholicism, connect themselves with the attack on C., the abolition of which would deeply affect the constitution and position of that church. So far back as 1817, the Catholic Faculty of Tübingen expressed the opinion that compulsory C. was one of the chief causes of the want of Catholic ministers. In 1826, the Catholic clergy of Silesia put in petitions to the bishop for the abolition of C.; and unions were afterwards formed in Baden, Württemberg, Bavaria, Silesia, and Rhenish Prussia, which, along with alterations in the doctrines and ritual of the Romish Church, combined attacks on the prohibition of marriage to the clergy. A work was also published, entitled *The Introduction of Compulsory Celibacy among the Christian Priesthood, and its Consequences* (Altenb. 1828, new ed. 1845), which excited great attention. At last the abolition of the law came to be discussed in the legislatures of Baden, Saxony, and other countries. The church claimed this subject as belonging exclusively to her jurisdiction, and not to that of the state; and in Württemberg the clergy induced the government to suppress the anti-celibacy society; but this only made their opponents in the press the more zealous. In

France, also, the question, about 1829, was eagerly discussed. And in Spain, the Academy of Ecclesiastical Science took the subject into consideration in a meeting held in 1842; while the Portuguese Chambers had previously, in 1836, discussed it, though without result. The same took place in Brazil, about 1827.

During the commotions of 1848, the subject was again brought into prominence in Germany. The German Catholics (q. v.) had already abolished C.; and a general measure was called for in the Frankfort parliament, in the Prussian Assembly, and in the press. In Austria, also, voices were raised against it; but here the state took the side of the pope who, in a bull of 1847, had added fresh stringency to the rule of C., and condemned its infringement. See BACHELOR.

**CELL** (Lat. *cella*, from *celo*, to conceal). The Latin word had nearly all the significations which we attach to the English one, and a good many besides which we have not borrowed. For example, the whole space within the walls of an ancient temple was called the *cella*. But the interior was frequently divided into several *cellae*, in which case each C. took the name of the deity whose statue it contained, and was called the C. of Jupiter, Juno, Minerva, and the like. In these cases, the word approached to its general meaning, which, with the Romans as with us, was that of a store-room, or small apartment where objects of any kind were stowed away. In modern architecture, the term Vaulting C. signifies the hollow space between the principal ribs of a vaulted roof.

**CÉLLÉ**, or ZELL, a town of Hanover, on the left bank of the Aller, which at this point becomes navigable, 23 miles north-east of the city of Hanover. It is situated in the midst of a sandy plain, well built, and has a palace with a garden, in which Matilda, sister of George III., is buried. Pop. (1871) 16,147. The inhabitants are very industrious. The chief manufactures are linen, hosiery, tobacco, wafers, soap, &c. An active commerce is also carried on by the Aller, and by railway.

**CELLI'NI, BENVENTO**, a celebrated Italian gold-worker, sculptor, founder, and medallieur, remarkable not only for his skill as an artist, but also for his checkered life, was born at Florence in the year 1500, and first displayed skill as a chaser and gold-worker. His autobiography is a remarkably curious and interesting work, presenting us with a complete picture of the author's life and character; his activity, his extraordinary weaknesses, the impetuosity of his passions, the perilous circumstances in which his quarrelsome disposition placed him (for C. thought nothing of committing manslaughter in a moment of rage), and the ludicrous vanity and credulity which are never absent from him. The book is also of great value in a historicoo-social point of view, but does not impress us favourably in regard either to the personal or social morals of the time.

At an early period, having been banished from Florence in consequence of an 'affray,' C. went to Rome, where he was employed by many distinguished patrons of art, but afterwards was allowed to return to Florence. Another 'affray' compelled him to flee to Rome a second time, where he secured the favour of Clement VII. C., by his own account, was as great in arms as in art; he declares that it was himself who killed the Constable Bourbon and the Prince of Orange at the siege of Rome. His reckless conduct for some years compelled his constant shifting between Rome and Florence, Mantua, and Naples. In 1537 he went to the court of France, where he was very honourably received. Illness, however, induced him to return yet once more to

he was liberated, through the intercession of the Cardinal of Ferrara, for whom he executed, out of gratitude, a fine cup, and various other works. He now accompanied his deliverer to France, and entered the service of Francis I.; but having incurred the displeasure of the ruling favourite, Madame d'Estampes, he returned to Florence—not, however, until, as usual, he had settled some matters with his 'sword'—where, under the patronage of Cosimo de' Medici, he executed several fine works in metal and marble—among them, the celebrated bronze group of 'Perseus with the Head of Medusa,' which now decorates the market-place in Florence. Among other preserved works of C., the splendid shield in Windsor Castle may be noticed. In his 58th year, he commenced writing his autobiography, and died in 1570 or 1572.

**CELLS, in Physiology.—I. ANIMAL CELLS.**—On examining, under a high magnifying power, any of the constituents of the animal body, we perceive that the smallest parts which appear to the naked eye as fibres, tubes, &c., are not ultimate elements in respect to form (morphotic elements), but that they contain and are built up of certain extremely minute particles, which differ in different organs, but always have a similar appearance in the same organs. By far the most important of these microscopic forms, which are known by histologists as 'simple elementary parts,' are the C., which not only form the starting-point of every animal and vegetable organism (the ovum in either kingdom of nature being simply a cell), but also—either as C., or after having undergone certain modifications which will be presently described—make up the tissues and organs of the perfect animal. Indeed, some of the lowest plants (red snow, gory dew), and of the simplest forms of animal life (GRIGORINA, &c., q. v.), appear to consist of a single cell (see fig. 1).

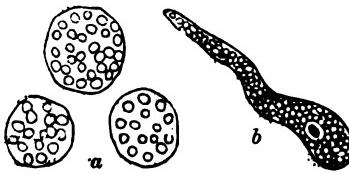

Fig. 1.

a, simplest forms of independent vegetable organisms, or unicellular plants; b, a gregorina—a unicellular animal organism.

While in plants the elementary parts generally unite directly with one another, in animals they are usually combined by an interstitial substance, which may be either solid or fluid, and is always derived from the blood or general nutrient fluid. If this interstitial substance take a part in the formation of the C., it is called a cytoplasm or a blastema, from *bukos*, a cell or vesicle, and *blastema*, germ-substance; if it has nothing to do with their maintenance, it is called the matrix. The cytoplasm is usually fluid, as in the blood, chyle, &c.; while the matrix is solid, as in cartilage, bone, &c.

In every cell, we can distinguish, if we use sufficiently high magnifying powers, a membranous envelope, known as the cell-wall or membrane, and certain contents. The latter are fluid or gelatinous, and besides containing particles or granules, usually exhibit a peculiar rounded body, the nucleus; which, again, contains in its interior a fluid and a still smaller corpuscle, the nucleolus.

706

the blood-corpuscles. Amongst other well-known

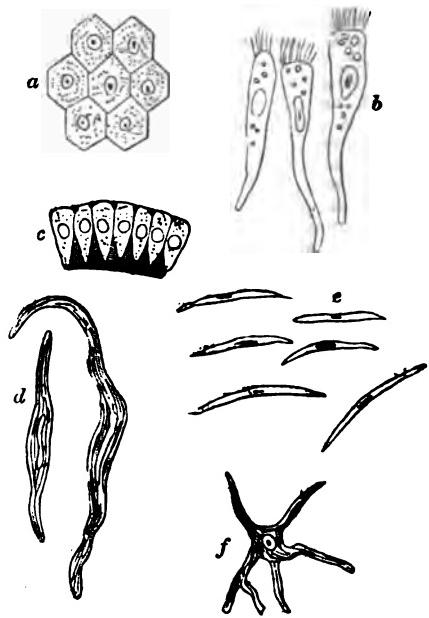

Fig. 2.

forms may be mentioned: a, the polygonal, as in pavement epithelium, or the pigment of the eye; b, the conical or pyramidal, as in ciliated epithelium; c, the cylindrical, as in cylinder epithelium; d, the fusiform, or spindle-shaped, as in contractile fibre-C.; e, the squamous, as epidermic scales; and f, the ciliate, polar, or stellate, as the C. in the gray nervous tissue (see fig. 2).

With regard to size, the largest animal C.—excepting the unicellular organisms—are the yolk-C. of the ova of birds and amphibia, while the blood-C. of certain animals may be taken as representing the smallest cells. Average C. range from 0.005 to 0.01 of a line in diameter.

The cell-membrane is usually transparent and colourless, mostly smooth, and so thin as to exhibit only a single contour, rarely of any measurable thickness. No traces of structure can be detected in it. The granular appearance which the membrane occasionally presents, is due to projections depending on granules lying on the inside; and it vanishes on the addition of water, which causes the cell to be distended by endosmosis. See OSMOTIC ACTION.

C. which contain only fluid are rare (fat-C., blood-C.); generally, besides fluid, they contain elementary granules and vesicles, and sometimes crystals. As a general rule, the number of these morphotic elements increases with the age of the cell; sometimes, however, this is not apparent, in consequence of their being grouped in a single mass around the nucleus.

The nucleus is usually spherical or lenticular, transparent, and either colourless or yellowish, and ranges from 0.002 to 0.004 of a line in diameter. All nuclei are vesicles, as was originally maintained, in 1841, by Schwann (*Microscopical Researches into the Accordance in the Structure and Growth of Animals and Plants*, Sydenham Society's translation, 1847, p. 173), who must be regarded as the

founder of the cell-theory in its relation to animal tissues, and as has since been confirmed by Kölle and other later observers. The contents of the nucleus usually consist,

with the exception of the nucleolus, of a limpid or slightly yellowish fluid, from which water and acetic acid precipitate granular matter. In general, only one nucleus exists in each cell, except when it is multiplying (a process which we shall presently explain); occasionally, however, we meet with several nuclei—four, ten, or even twenty (see fig. 3).

The nucleus is round, sharply defined, and often so small as to be almost immeasurable. Nucleoli are found in most nuclei so long as the latter are still young, and in many during their whole existence. As, however, nuclei exist in which no nucleolus can be detected, we cannot regard the nucleolus as so essential an element of the cell as the nucleus. Most commonly a nucleus contains only one nucleolus; two are not unfrequently seen; more are rare.

Our knowledge of the chemical composition of C. is very imperfect. That the cell-membrane is a protein substance (q. v.)—at all events in young C.—is obvious from its solubility in acetic acid and in dilute caustic alkalies; and the membrane of the nucleus seems to have a similar composition; while there are chemical reasons for believing that the nucleolus is composed of fat. In the contents of most C. we usually find such substances as occur in solution in the cytoplasm—viz., water, albumen, fat, extractive matters, and salts; and in the C. of secreting organs, as, for instance, the liver and kidneys, we find the special secretions of those glands; in the blood-C., we find haemato-crystalline, &c.

There are two perfectly distinct ways in which C. can be generated: they may be developed independently of other C. in a plastic fluid (the cytoplasm); or they may be developed from pre-existing C. by cell-multiplication, the existing C. either producing secondary C. within themselves, or multiplying by division. In both these latter kinds of cell-development, the nucleus seems to be the centre of development of the young cells.

In order that free or independent cell-development shall take place, we must have a cytoplasm containing protein substances (probably fibrin), fat, and certain salts (especially phosphates) in solution; and very possibly the presence of the particles of pre-existing C. may also be necessary, in which case free cell-development ceases to exist. The chyle and lymph corpuscles may be mentioned as examples of this mode of cell-formation. The steps of the process are not very clearly made out, but we know that the nuclei are first formed, and that the cell-membranes are developed around them. Free cell-development is far less common in man and the higher animals than cell-multiplication, and, we believe, never occurs in the vegetable kingdom. All pathological cell-formations—the C. in pus (q. v.), and in other morbid exudations—come, however, under this head.

The development of C. within other C. is of very common occurrence. An original or parent cell produces two or more secondary or daughter C., and the process of formation is said to be

endogenous. Cartilage-C. afford a good example of this process. The nucleus and the contents of each parent cell undergo division into two parts, so that the number of C. is successively doubled. This process is exhibited in fig. 4, where a represents

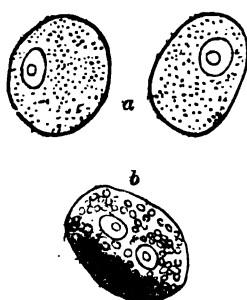

Fig. 3.

a, cell with a single nucleus;  
b, a cell with two nuclei.

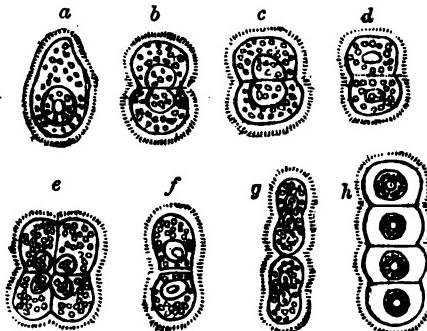

Fig. 4.

the original cell; b, the same, beginning to divide; c, the same, shewing the complete division of the nucleus; d, the same, with the halves of the nucleus separated, and the cavity of the cell subdivided; e, a continuation of the same process, with cleavage in a direction transverse to the first, so as to form a cluster of four C.; and f, g, h, the production of a longitudinal series of C., so as to produce filaments, by continuous cleavage in the same direction. The mode in which the multiplication of the nucleus takes place cannot be definitely made out in all cases, but when clear observation is possible, the nucleoli first divide into two, and then separate.

A multiplication of C. by division has been proved to take place in the red blood-C. of the embryos of birds and mammals, and in the first colourless blood-C. of the tadpole, and very probably occurs extensively in many embryonic and adult tissues, in which a self-multiplication of C. is certain, but where no parent C. with secondary C. can be detected. In fig. 5 are shown the blood-C. of the

Fig. 5.

Blood-corpuscles of the Chick, in the act of division.

chick dividing in this manner. In this and similar cases we have an elongation of the cell, and the single nucleus becomes divided into two; the cell then suffers constriction in the middle, which proceeds till it finally separates into two parts, each of which contains a nucleus. This variety of cell-formation affords a good illustration of the doubt and difficulty connected with this class of investigations. It was altogether unknown to Schwann when he published his great work in 1839, and was first noticed and described by Remak in 1841, who, however, subsequently retracted his published view, and did not again advocate it till Kölle confirmed his observation, and declared it to be correct.

No satisfactory theory has been propounded with the view of explaining the development of cells. Schwann compares the formation of C. with that of crystals, but it must be recollect that the molecular attraction concerned in the formation of

C. is so far peculiar, that—1. It never produces geometrical solids, but even in the nucleus and nucleolus determines a globular form; 2. That it aggregates not homogeneous, but chemically different substances; and 3. That the final result of its action—namely, the cell—is extremely limited in size, while a crystal may be of a comparatively indefinite magnitude.

The growth of C. requires some notice. Growth probably occurs in all C., although not in all to the same extent. It is most obvious in those which are formed directly round a nucleus, since in these the membranes which at first closely invest the nucleus, in time become distended and enlarged, and merely remain in contact with the nucleus at one point. Growth may take place either in surface or in thickness. The former is most commonly general—viz., in all those cases where C. increase without altering their form; but is sometimes partial—viz., in those cases in which the cell deviates considerably from the primary globular form. The latter occurs

to a certain degree in all C., but in some kinds to a far greater extent than in others. In fig. 6, two cartilage-C., magnified 350 diameters, are shewn, in which the walls are much thickened; in addition to their nucleus, each contains a clear drop of fat. The nuclei and nucleoli also take part to a certain extent in the growth

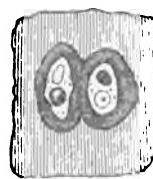

Fig. 6.

of the cells. Schwann gives the following general explanation of the process of growth. He considers that the molecules of the cell-membrane exert an attractive influence on the fluid which surrounds them, and deposit its newly formed particles amongst themselves. If the deposition take place between the molecules already present in the substance of the membrane, the cell becomes distended; if it take place only in one or more definite directions, the membrane becomes thickened.

Having now traced the cell to the period of its full growth, we are prepared to consider the processes which occur in the interior of this minute organic structure, or, in other words, the physiology of cells. To enter satisfactorily into this subject, we ought to have an exact knowledge of the chemical composition of the contents of different cells. All that we know of the contents of C. generally is, as we have already stated, that they usually consist of a moderately concentrated solution of protein matters, with alkaline and earthy salts, and dissolved or suspended fat-particles; and that besides these ingredients many C. contain either a great preponderance of one of these constituents, to the almost entire exclusion of others, or are found to contain altogether new substances. Thus, there are C. with much protein matters, as the nerve-C., and with much fat, like the fat-C.; while there are other C. which specially contain haematin (the red colouring matter of the blood), pigment, biliary and urinary constituents, mucus, milk, sugar, &c.

The main cell-processes occurring in these variously constituted C. are absorption, secretion, and excretion. These depend principally, if not entirely, upon chemical and physical laws, and are to a great extent amenable to micro-chemical observation.

Absorption, or the appropriation of matters from without, is most manifest in those C. which, at first have little or no contents save the nucleus. Although endosmose must be taken into account as a condition of absorption, C. must not be regarded merely as vesicles provided with indifferent porous membranes; for the filling of C. does not take place by their admitting every kind of matter

indiscriminately; but they have the power of taking up one constituent, and rejecting another, and thus exhibit a selective faculty.

The cell having thus become filled from without, we have next to inquire into the changes which take place in the membrane and in the contents. As regards the former, the membranes of most C. not only become denser and more solid with age, but they undergo changes in their chemical constitution. Thus, in the horny tissues, the young C. are easily soluble in alkalies and acids, while older C. of the same nature are scarcely affected by these re-agents; again, in cartilage-C., the membrane not only becomes firmer with age, and thickens as ossification proceeds, but is changed into a tissue yielding gelatine or glue on boiling, which subsequently becomes impregnated with salts of lime (phosphate and carbonate). See BONE.

The function of secretion is mainly carried on by changes in the contents of the cells. Thus, mucus is formed in the epithelial C. of the mucous membranes, pepsin in those of the gastric glands, bile in the C. of the liver, and sepia in the C. of the ink-bag of the cuttle-fish. In these cases, the C. do not separate mucus, pepsin, &c., from the blood, but merely the materials from which they elaborate these substances. In other cases, as, for instance, in the C. of the kidney, the function of these minute organisms is not to manufacture new products, but merely to separate certain substances (urea, uric acid, &c.) from the blood, which, if not immediately removed from the general circulation, would speedily accumulate, and act as a deadly poison. That these C. merely separate the urea from the blood, and do not form it in their interior, is proved by the fact that, if the kidneys of an animal are extirpated, the urea and other urinary constituents may speedily be found in large quantity in the blood.

Excretion takes place by the bursting or solution of the distended secreting cell, usually into the duct of a secreting gland. The reader who desires further information on the functions of the C. in relation to secretion and excretion, is especially referred to an admirable memoir by Professor Goodair, 'On Secreting Structures,' published in John and Harry D. S. Goodair's *Anatomical and Pathological Researches*, 1845.

In conclusion, we must notice the metamorphoses of cells. The ovum itself is, as we have already mentioned, merely a nucleated cell; after impregnation, a number of secondary C. are formed within it, by a process of cleavage or segmentation. See articles GENERATION and OVUM. Some of the C. which occur in the ovum in its early stages soon coalesce with others to form the higher elementary parts, which we shall shortly enumerate; others, without entering into combinations, more or less change their previous nature, as the horny plates of the epidermis and nails; while others, again, undergo no change of form throughout the period of their existence.

The permanent C. are arranged by Kölliker (*Manual of Human Histology*, translated by Busk and Huxley, 1853, vol. i. p. 47) under the following heads:

1. *True Cells*, which have in no essential respect altered their cellular character. These occur in the epidermis and the epithelium; in the blood, chyle, and lymph; in the glandular secretions, in the fatty tissue, in the gray nervous substance, in the glands (liver, spleen, &c.), and the cartilages. Their varieties of form and contents have been already noticed. Regarding their modes of occurrence, some are either isolated in fluids or in solid tissues; others are united by apposition, without any intervening structure, into a cellular parenchyma;

while others, again, are conjoined by an intercellular substance of some kind.

*2. Metamorphosed Cells.* To these belong—*The horny scales*: flattened, polygonal, or fusiform; their membrane being fused into one mass with their contents. They occur in the epidermis, the laminated pavement epithelium, and the hair and nails. *The contractile fibre-C.*: fusiform, slightly flattened, considerably elongated C., whose membrane, with its soft, solid contents, is changed into a contractile substance. They occur in the smooth or involuntary muscles. *The tubules of the crystalline lens of the eye*: very elongated C., with viscid, albuminous contents. *The prisms of the enamel of the teeth*: greatly elongated, prismatic, and strongly calcified cells. *The bone-C.*: thickened C. (with *canalicii*, or minute branching canals) which have coalesced with the matrix of the bones. *The transversely striated muscular C.*: large polygonal C. whose contents have become metamorphosed into a transversely striated or striped tissue, such as is found in voluntary muscular fibre. From these C. are formed all the different fibres, networks, membranes, tubes, &c.; in short, all the higher elementary parts of which the animal body is composed.

For further information on C. and cell-development, the reader is referred, in addition to the works quoted in this article, to Leydig, *Lehrbuch der Histologie des Menschen und der Thiere*, 1857; and to Frey, *Histologie und Histochemie des Menschen*, 1859; while he will find full details on morbid cell-development (the development and growth of C. in tubercle, cancer, and other morbid deposits) in Vogel's *Pathological Anatomy of the Human Body*, translated by Day, 1847; and in Wedl's *Pathological Histology*, translated (for the Sydenham Society) by Busk, 1855.

**II. VEGETABLE CELLS.**—In the vegetable, as in the animal kingdom, the primary form of the cell is that of a sphere. There are, however, interfering influences, which usually alter or modify the primary form, of which the most important are, (1.) Special directions assumed in the development, in obedience to a law regulating the structure of the tissue in which the cell occurs; and (2.) Obstructions to the expansion of the cell in certain directions from the pressure of surrounding cells.

The most common forms referrible to the law of development are, (1.) The *spherical* or fundamental form; (2.) The *cylindrical*, in which there is a tendency to elongation in the direction of a vertical axis; and (3.) The *tubular*, in which there is an excess of development in the direction of the two transverse axes.

The secondary modifications of these forms are numerous. Thus, in lax tissues, the spherical form may become an irregular spheroid, running out into *lobed*, and even *stellate* forms, as may be seen in the pith of rushes and the stems of various aquatic plants. Again, in seeds, the hard part of fruits, &c., the mutual pressure of the C. converts the spherical into *polyhedral* forms, of which the *dodecahedron*—giving a hexagonal section, and arising from equal pressure in all directions—is the most common, although *cubic* and many other forms occasionally occur.

The magnitude of the vegetable C. is very varied. In flax, the liber-cells have been found  $\frac{1}{4}$ , or even  $\frac{1}{2}$  of an inch in length, and the cylindrical C. of some of the Conferves are more than an inch long—although their transverse diameter is very minute—whilst, on the other hand, the spores of Fungi are C. of a diameter of  $\frac{1}{100}$  of an inch. The average diameter of the C. in the parenchymatous tissues is about  $\frac{1}{10}$  of an inch.

Both the cell-wall and the contents differ from the corresponding parts in animal cells. In all young C. the wall is membranous, freely permeable by water, elastic, and flexible. In many cases it retains these properties, whilst in others it becomes much modified, as the cell grows older. It consists mainly of **CELLULOSE** (q. v.). As the vital and chemical phenomena exhibited by plants depend primarily upon operations in the interior of the cell, the careful study of the cell contents is of the highest importance. Of these contents, the most important are the *primordial utricle*, with the *protoplasm*, the *nucleus*, *chlorophyll corpuscles*, and *starch granules*.

The primordial utricle is a layer of substance of mucilaginous consistence (coloured yellow by iodine), lining the entire wall of the young cell, but often disappearing at a comparatively early period. The protoplasm is a tough mucilaginous and frequently granular fluid, which fills up the space in the interior of the cell not occupied by the nucleus. The nucleus or cytoplasm is a globular or lenticular body, identical in its character with the substance of the primordial utricle, and occurring in the protoplasm of most young cells. Little is known with certainty regarding the chlorophyll corpuscles, except that, under the influence of solar light, green colouring matter is developed from them. Of the starch granules, which are very commonly found in the cell contents, we need not speak, as they are sufficiently described in the article **STARCH**.

In addition to the above organised structures, we must mention as frequent constituents of the cell-contents, fluid colouring matters, essential and fixed oils, resins, sugar, dextrine, gum, alkaloids, and mineral or organic salts, which are not unfrequently found in a crystalline form, when they are termed raphides.

There are two modes of cell-development in the vegetable kingdom—viz. (1.) *Cell-division*, where two or more new cells fill the cavity of the parent cell, and adhere to its membranes, appearing to divide it into compartments; and (2.) *Free cell-formation*—not to be confounded with a process of the same name which is supposed to occur in the animal kingdom—in which the whole or part of the cell-contents become detached from the cell-wall and resolved into new loose C., which ultimately escape from the parent cell. The former mode universally occurs in the formation of the C. by which growth is effected; the latter occurs only in the production of C. connected with reproduction. For further information, we must refer the reader to Von Mohl's *Principles of the Anatomy and Physiology of the Vegetable Cell*, translated by Henfrey, London, 1852.

**CELLULAR TISSUE.** This is the old term for a widely diffused animal texture, which has also received the names of areolar, reticular, filamentous, and connective tissue. If we make a cut through the skin, and proceed to raise it, we see that it is loosely connected with the subjacent parts by a soft, filamentous, elastic substance, which, when free from fat, has a white feathery aspect. This is the tissue in question. It is also found underneath the serous and mucous membranes which are spread over internal surfaces, and serves to attach these membranes to the parts which they line. We likewise find it lying between the muscles, the blood-vessels, nerves, &c., occupying the interspaces between the different organs, and often investing each of them with a special sheath. While it thus connects and insulates entire organs, it at the same time performs a similar function in regard to the minute parts of which each organ is made up. Thus, for instance, in muscular tissue, it enters between the fibres of the muscle, uniting them into bundles; and similarly, it enters

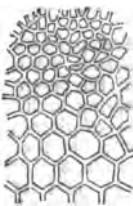

into glands, &c. This is termed *penetrating* or *parenchymal* cellular tissue.

It is not only one of the most general and most extensively distributed of the tissues, but it is continuous through the whole organism, and may be traced without interruption from any one region of the body to any other. It is in consequence of this continuity that dropical fluids, air, &c., effused into the C. T., may spread far from the spot where they were first introduced.

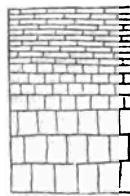

On examining a fragment of this tissue, when stretched out, we see with the naked eye that it presents the appearance of a multitude of fine, soft, colourless, elastic threads, like spun glass; intermixed with these are delicate films or *lamineæ*, crossing one another in all directions, and leaving open spaces, or *aeroleæ*; hence the name of areolar tissue.

A small quantity of colourless transparent fluid is always present in this tissue; when abnormally increased, it gives rise to the form of general dropsy known as *anasarca*. The microscopic characters of C. T. are briefly noticed in the article *Tissues*, *ANIMAL*.

**CELLULAR TISSUE**, in Botany, is any vegetable tissue formed of cohering cells alone, and in which there are no vessels. It is often called *parenchyma* (Gr. something spread out), although an attempt has been made to restrict that term to one kind of it, with cells of a particular form, and terms of Greek derivation have been multiplied for other kinds. The cells of C. T. vary much, both in form and size (see *CELLS*); but particular forms and sizes are characteristic of particular kinds or particular parts of plants. The products of the vital activity

Cellular Tissue in

Muriform Cellular Tissue  
in Wood or Bark.

of plants are formed in the interior of cells, or by secretion from the inner side of their walls. Vessels being formed from cells, it is not easy to fix the limits between C. T. and *Vascular Tissue* (q. v.). Some kinds of plants, however, are entirely composed of C. T. (see next article); all consist of it in the earliest stages of their growth; none are at any time destitute of it. Fluids are transmitted from cell to cell, through the mass of C. T., passing through the walls of the cells where there are no openings that can be detected by the microscope. The soft and succulent parts of plants, which it is the care of the gardener to cherish and increase, consist chiefly of cellular tissue.

**CELLULAR'IES**, in Botany, a designation applied to those plants which consist entirely of *Cellular Tissue* (q. v.), without proper vessels of any kind. C., thus defined, are a sub-class of acotyledonous plants, containing the orders of *Lichens*, *Fungi*, and *Algaæ*. In the system of De Candolle, however, the name C. was given to the second grand division of plants, the first being called *Vascularares*, and the distinction between them being the presence or absence of vessels, the C. including all acotyledonous or cryptogamous plants. But ferns and mosses are not destitute of vessels; so that this system is not strictly accurate with regard to them: whilst, as all

vessels are now known to be formed by the elongation and union of cells, the distinction between vascular and cellular tissue is not generally regarded as affording a good basis for primary divisions in the classification of plants.

**CELLULO'SE** is the term applied to the carbohydrate,  $C_{12}H_{22}O_{11}$ , which forms the mass of the cell-membrane of all plants. It is one of a class of compounds intimately connected in their chemical constitution, but presenting remarkable physical differences. Without entering into chemical details, we may mention the following points of difference between it and the chemically allied substances—sugar, dextrose, and starch. Sugar and dextrose are soluble in cold water, and occur in the cell sap in solution; starch is insoluble in cold water, but softens into a mucilage in boiling water, and is found in granules in the cell-contents; while C. is insoluble in cold or boiling water, and, as far as is at present known, is very slightly soluble in the strong mineral acids, its only perfect solvent being a solution of oxide of copper in ammonia.

The occurrence of C. in an organism was formerly regarded as a certain proof that the latter belonged to the vegetable kingdom. It has, however, been shewn to be a constituent of the lower animals.

Although C. forms a large proportion of the food of herbivorous animals, it is supposed to pass through the intestinal canal unchanged, and not to contribute directly to nutrition.

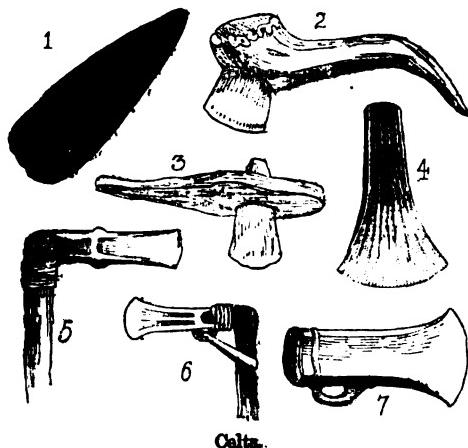

**CELSUS**, an Epicurean philosopher, but tinged with Platonism, lived in the 2d c. after Christ, and wrote, after 150 A.D., under the title *Logos Alches* (the True Word), the first considerable polemic against Christianity. The book itself has perished; but considerable fragments have been preserved as quotations given by Origen in his answer, *Contra Celsum*, in eight books. In the fragments—which are very interesting, as shewing the views of a heathen philosopher in regard to Christianity—C., with wit and acuteness, but without depth or earnestness of thought, prefers against the new religion charges of unphilosophicalness and blind credulity; and especially endeavours to convict Christians of self-contradiction in their spiritual doctrine contrasted with their anthropomorphic representations of Deity; in their religious arrogance contrasted with their confession of sinfulness; and in their views of the necessity of redemption. He also reproaches Christians with their party divisions and ever-varying opinion. With regard to his own positive doctrines, he speaks of evil as necessary and eternal, as an essential property of the material world (*hyle*); sin as something that can never be entirely removed, and least of all, through a vicarious sacrifice. He charges Christians with having wilfully altered their sacred writings.

**CELSUS, AULUS CORNELIUS**, a Latin physician and writer, who flourished probably in the reign of Augustus. He was called the Roman Hippocrates, because he generally followed the great 'Father of Medicine,' and introduced the Hippocratic system among the Romans. C. wrote not only on medicine, but also on rhetoric, history, philosophy, the art of war, and agriculture. His style is succinct and clear, but full of Græcisms. The only great work of his which survives, is the *De Medicina*, which is divided into eight books. The portions relating to surgery are exceedingly interesting and valuable, because C. has there given an account of the opinions and observations of the Alexandrian school of medicine. The first edition of the *De Medicina* appeared at Florence in 1478. C.'s works have been translated into several modern languages. A translation into English was made by Dr Grieve, London, 1756.

Among the best editions are those of Krause (Leip. 1766), Dr Milligan's 2d edition (Edin. 1881), and one at Cologne, 1885.

**CELT** (Lat. *celtis*, a chisel), the name by which certain weapons or implements of the early inhabitants of Western Europe are known among archaeologists. Celts are either of stone or of bronze.

Stone celts vary in length from about 1 inch to 22 inches; but the most common size is from 6 to 8 inches in length, and from 2 to 3½ inches in breadth. They are made of almost every kind of stone, and shew considerable diversity of shape, almost all, however, having more or less resemblance to the muscle-shell. Fig. 1 in the accompanying wood-cut shews a stone C. of the better kind. The ruder celts are generally of slate, shale, schist, or grit; the finer, of flint, porphyry, greenstone, syenite, or agate. Many of the finer celts are beautifully shaped and highly polished. A remarkable example of this class, the property of Sir Coutts Lindsey, found near St Andrews, in Scotland, is described by Sir David Brewster in the *Philosophical Journal* for 1823. Recently, a class of celts found in the later geological strata have excited much interest as well among archaeologists as among geologists. They are obviously of the same type with the more common celts, but of ruder construction, as if fashioned by a more barbarous people. The stone C. was fastened into a handle of horn, bone, or wood, as shewn in the accompanying wood-cut. Fig. 2

represents a C. of serpentine, with a handle of deer-horn, found in one of the Swiss lakes in July 1859. Fig. 3 represents a stone C. with a wooden handle, found in the county of Tyrone, in Ireland.

Bronze celts vary in length from about 1 inch to 8 or 10 inches, the most common length being about 6 inches. They are sometimes ornamented with rudely incised lines or circles, and have occasionally been found wrapped up in linen, or enclosed in bronze cases or sheaths. They shew much greater diversity of shape than the stone celt. As many as four classes have been distinguished by archaeologists—1st, The simple wedge-shaped C., most nearly resembling the common form of the stone C., as in the accompanying wood-cut, fig. 4. 2d, The wedge-shaped C., with sides more or less overlapping, and a stop ridge or elevation between the blade and the part which received the handle, as in fig. 5. 3d, The wedge-shaped C., with sides greatly overlapping, with or without the stop-ridge, but with a loop or ear upon, and parallel to, its lower surface, as in fig. 6. 4th, The socketed C., or the C. with a

hollow to receive the handle, and generally with a loop or ear upon its lower surface, as in fig. 7.

Both stone and bronze celts were probably used for several purposes, serving for chisels, adzes, and axes, as well as for weapons of war, like the stone hatchets of the South Sea Islanders and other savage or barbarous tribes. Examples of stone and bronze celts of all classes (together with the moulds in which bronze celts were cast) may be seen in the British Museum at London, in the National Museum of the Antiquaries of Scotland at Edinburgh, and in the Museum of the Royal Irish Academy at Dublin. This last collection has more than 500 examples of stone celts, about one-half of which were found in deepening the bed of the Shannon or its tributaries, between the years 1843 and 1848. A basket of bronze celts has more than once been discovered at one spot.

**CETIBERI**, a powerful people of ancient Spain, supposed to have sprung from a blending of the Iberians or Spanish aborigines with Celtic invaders from Gaul. The C. inhabited a large inland district of the Peninsula, corresponding to the south-west half of Aragon, nearly the whole of Cuanya and Soria, and a great part of Burgos, but the name Celtiberia had often a wider signification, including the country as far south as the sources of the Guadalquivir. The C. were divided into four tribes, and were unquestionably one of the bravest and noblest peoples in the Peninsula. Their cavalry and infantry were equally excellent. For many years, they withstood the efforts of the Romans to subdue them, and it was not till after the campaigns of Scipio that they began to adopt the Roman language, dress, and manners.

**CELTIC NATIONS**, one of the groups of the great Aryan (q. v.) family.

**Language**.—In addition to the English, and retreating before it, there are at present four languages spoken in the British Isles—the Irish, the Highland Scotch (or Gaelic), the Manx, in the Isle of Man—all three nearly related to one another, and constituting the northern (Erse, Gadhelic) branch of the Celtic languages; whilst the fourth language, the Welsh, constitutes, together with the Cornish of Cornwall (extinct since 1778) and the Bas Breton of Brittany, the southern (Briton, Cymric, Cambrian) branch. The remains of the language of the Gauls or Celts, the ancient inhabitants of France, closely resemble the British and Gadhelic idioms; hence the name Celtic languages has been applied to the whole of them. The Celtic idioms belong to the Indo-German (Aryan) family, as their numerals shew. Compare

The Gaulish was nearer to the Cymric branch, its numerals 4 and 5 having been *petor*, *pempe*. There are a few Gaulish inscriptions which shew a declension with full inflections; in old Irish, five cases still exist, but the terminations are very much mutilated; in Welsh, they have disappeared. Thus, the Gaulish name *Segomaros* is declined: gen. -ri, dat. -ru, acc. -ron: the old Irish, *fer*, a man, has the gen. *fir*, dat. *fur*, acc. *fér*, voc. *fér*; whilst the corresponding Welsh *gwyr* is inflexible. Hence it follows that the

pseudo-simplicity of the Welsh is the result of grammatical decay, common in all Aryan languages, and does not at all warrant Latham's theory, that the Celts branched off from the primitive Indo-German nation before the development of case inflections.

*History.*—Of the separation of the Celts from the other Aryans or Indo-Germans, and their early migrations to Western Europe, no record has come down, the stories about Milesian colonies in Ireland, and migrations from Troy into Wales, being simply monkish fictions. At the dawn of history, we find the *Gauls* (*Galli*, *Celtae*, *Galatae*) occupying France (*Gallia*), which was divided into *Aquitania*, between the Pyrenees and Garonne; *Gallia Celtaica* Proper, between Garonne and Seine; and *Belgica*, from the Seine to the Rhine. The land about the *Rhone* being more early conquered by the Romans than the rest, was set apart by them under the name of *Gallia Narbonensis*, or *Gallia Lugdunensis* (from the towns Narbo and Lugdunum, Narbonne and Lyon). The whole of the four was called *Gaul beyond the Alps* (*Gallia Transalpina*). A great many tribes of Gauls had settled in Lombardy, where they founded *Mediolanum* (Milan), and which therefore took the name *Gallia Cisalpina* (*Gaul this side the Alps*). Other Gauls had penetrated into Spain, where they became mixed with the native Iberians, and thus gave rise to the *Celtiberians* about the river Iberus (Ebro). Numerous hosts migrated across the Rhine, occupied Southern Germany and Bohemia, and, following the course of the Danube, some invaded Thrace and Greece (278 B.C.); but being repelled, the main body of them settled in Asia Minor, in the province called after them *Galatia*. The Romans found the Gauls at first very formidable enemies; Rome itself was burned by them (389 B.C.), but gradually the Romans conquered first *Gallia Cisalpina* (222), then *Gallia Narbonensis* (112), and lastly, Caesar subjected all France (52 B.C.), after which the Gauls soon became Romanised. The Gauls of Asia Minor, for a long time the terror of all the neighbourhood, were defeated by the Romans (187), and their land finally made a province of the empire (25 B.C.).—The *Britons* (*Britanni*; Welsh, *Brython*) were little known before Caesar's two unsuccessful expeditions into Britannia; the country was conquered by the Roman general *Agricola* (78–84 A.D.), who secured the new province against the inroads of the Caledonians of Scotland by a fortification across the Scotch Lowlands, between the Forth and the Clyde, afterwards removed by the Emperor *Hadrian* further southward, to between Solway Firth and the mouth of the Tyne. The Britons were so much influenced by Roman civilisation—they were also early converted to Christianity—that the heathen Angles and Saxons, who conquered them in the 5th and 6th centuries, called them *Welsh*; a name which, with the other Teutons, applied to all nations speaking languages of Latin descent. A few of the Britons maintained their independence in Cornwall, Cumberland, and in the mountains of *Wales*. On the last, the name *Welsh* was ultimately fixed by the English; they themselves, however, called their nation *Cymro*, pl. *Cymry* (a compound of *cyn*, with, in common, and *bro*, land = having a common country, countrymen, in contradistinction to the foreign invader), a name which has nothing to do with *Cimbri* and *Cimmerii*. The Welsh remained independent under different petty princes till 1282, when Edward I conquered them. A part of the Britons went over in the 4th c. to France, where they took possession of *Brittany*, which maintained a doubtful independence under dukes of its own till about 1500.—Whether the *Caledonians*, the oldest

inhabitants of Scotland, were Celts of the Cymric or *Euse* branch, is unknown. After the 3d c., their name disappears, and we hear, instead, of the *Scoti* and *Picti*. As to the latter, the same doubt prevails; but the *Scoti* were emigrants from Ireland, both *Scotus* and *Gadhebus* being common national names of the old Irish. From *Gadhel*, the modern *Gael*, *Gaelic* is derived, which has nothing to do with the name of the Galli.—*Ireland* (*Hibernia*, whence the modern *Eirena* is derived) enters into the light of history with its conversion to Christianity by St Patrick (460). The four centuries following on this event are the brightest period in its history. Ireland was then the seat of piety and learning, and sent forth numerous missionaries, by whom many monasteries, centres of civilisation, were founded—as *Iona*, in Scotland, by Columba (563); *St Gall*, by Gallus (615); *Wurzburg*, by Kilian (687). In the 7th c., we find Irish bishops at Ratisbon; and *Virgilius* (Fergus), (died 784), Bishop of Salzburg, played no small part in the ecclesiastical history of Germany. But Ireland remained politically divided among many princes, and so became an easy prey of those 'black heathens' the Scandinavians, whose invasions began 795, and who founded Norse kingdoms at Dublin, Waterford, Limerick, &c. In the fierce battles between the two nations, the prosperity of Ireland rapidly declined, and the English conquest (1171) only completed the ruin.—The Isle of *Man*, inhabited by a branch of the Irish, after having been subject to Welsh, Scotch, Norse princes in turn, acknowledged England's sovereignty in 1344.

*Religion and Mythology.*—A few notices in the classics and the Latin inscriptions of Gaul are our rather meagre sources of information on the Celtic paganism. As the three chief gods, or three of the chief gods, Lucan mentions *Tevates*, *Hesus*, and *Taranis*, all of them worshipped with human sacrifice. *Taranis* reappears as *Jupiter Taranucus* on an inscription; and from this identification with Jupiter, as well as from the fact that in Welsh *taran* means thunder, we may infer that he was the god of the thunderstorm. Other gods frequently occurring on inscriptions are *Apollo Grammus*, *Apollo Belenus*, *Mars Camillus*, *Minerva Beliana*, &c., all of them, however, empty names to us. A remarkable feature in Gaulish religion was the worship of certain *Mother Goddesses* (called on the inscriptions *Junones*, *Matronea*, *Deae Matres*, *Campostrees*, *Nymphæ*). They are frequently connected with special localities, as in the inscriptions dedicated to *Matronia Laneshibus*, M. *Hamavehis*, M. *Rumanehabus*, and on the one in Gaulish: *Matre Namaucicabo*, 'to the Mothers of Nîmes'. To this class apparently belongs the *Dea Nehalennia*, once represented on a relief with a basket of fruit, and a dog for companion. *Mela*, the geographer, speaks of an island in the Atlantic, near Gaul, where there was an oracle superintended by nine maidens, who could cause storms, take the form of any animal, could cure what otherwise was incurable, and predicted the future. These goddesses, at once motherly and maidenly, residing in field and wood (campostrees, nymphæ), givers of plenty and prophets of the future, are the heathen prototypes of the *fées* (fairies, as distinguished from 'elfs') of the middle ages. The 'little folk' were known to the Gauls under the name of *Dusi*. They believed in the existence of individual tutelary genii, as a stone of Lausanne shews, being erected by three Gauls *Sulpis suis* (hence our *sylph*!). The belief in the transmigration of souls was common amongst the Gauls, or at least their priests the *Druids*, so called from their performing sacred rites in oak-woods (Welsh, *derw*, an oak; *derwyd*,

a Druid). These Druids were also the depositaries of knowledge and tradition, and constituted, in Gaul at least, a powerful hierarchy, with a supreme pontiff. Druids are found both in Ireland and in Wales, and the fees abound in Welsh tradition; but it is very doubtful whether the superhuman beings appearing in the Welsh poems of the 12th and 13th centuries—such as *Hu Gadarn*, the reputed founder of Bardic institutions (see beneath)—are genuine relics of the British religion. The belief in transmigration lasted very long, as the medieval Welsh tale of *Taliesin* speaks distinctly of Taliesin's successive existences. Though not properly mythological, we may mention here the romantic stories of the Britons about King Arthur and his knights. He is first mentioned by Nennius in the 9th c.; but his fable was further developed in the next centuries both in Wales and Brittany, then embodied in Geoffrey of Monmouth's *Historia Britonum*, which served as the groundwork of the French *Roman de Brut* of Wace. Through these works, and partly, also, through the direct influence of the oral traditions of Brittany, it passed into French literature, and thence spread over all Europe.

*Literature*.—The Gauls learned writing from the Greeks; later, they employed the Roman alphabet, as do the Welsh and Irish, the now used Irish character being nothing but the common Anglo-Saxon form of the Latin alphabet. Besides, however, the Irish claim an old character of their own, the Ogham, in which the letters are represented by a number of vertical strokes put in a right angle to a horizontal line, or else by horizontal strokes to a vertical line. Some of the Ogham inscriptions are said to be older than Christianity. Even more doubtful is the antiquity of a Welsh so-called Bardic alphabet, in which there seem to be no inscriptions extant, and which is, at anyrate, an alteration of the Roman character. A feature common to all Celts is the existence of a kind of literary order, the *Bards* (q. v.), poets and guardians of tradition—in Gaul, nearly related to or part of the priesthood; in Wales and Ireland, in immediate connection with the kings.—A *Gaulish* literature there certainly was, as Caesar informs us that, in the schools of the Druids, the young men used to learn by heart a great number of verses on theological and historical subjects. But these poems were never written down. It is highly probable that rhyme, first used by St Ambrosius (397) in his hymns, is of Gaulish origin, this being the common form even of the oldest Irish and Welsh poems.—The *Irish* literature began with the conversion, but our existing manuscripts are not older than the 9th or 8th century. Interlinear versions of biblical and other theological, or of grammatical writings are about the oldest manuscripts, many of which, in consequence of the missionary zeal of the nation, are to be found at St Gall, Milan, and other continental places. Then there are ecclesiastic hymns, one of the oldest ascribed to Patrick. A renowned author of poems, in the 10th century, was Eochad O'Flan. Secular poetry of ancient times there has come down to us none, but we have testimonies as old as the 12th c., of the existence of such, ascribed in a general way to the old pagan hero Oisín, son of MacCumhal. The existing specimens, mostly warlike—except some dialogues between Oisín and St Patrick—are recent. Those Gaels that went over to Scotland, took, of course, similar traditions with them. With a partial knowledge of these, Macpherson composed (1765) the work which he declared (rather loosely) to be an English translation of the songs of the old Scotch poet Ossian, son of Fingal (the true Oisín was an Irishman).

The would-be Gaelic original of Macpherson's work, edited 1807, is in all probability a retranslation. Of Irish prose, the annals are the most important part: first, those of Tigernach (1088), then the *Annales Inisfalienses*, *A. Ultonienses*; lastly, the *Annals of the Four Masters*, being a compilation made (1634) from older sources chiefly by four Franciscans, beginning with 242 after the Deluge, and ending with 1616 A.D.—The oldest remains of Welsh literature are the songs, so far as they are genuine, of the bards of the 6th c.—*Litawarch Hen*, *Aneurin*, *Taliesin*—having chiefly the life and deeds of contemporary princes for their subject, but few in number. In the 10th c., we have the collection of laws by Howel Dda. The historians Gildas and Nennius, of the 9th c., wrote in Latin.

The great age of Welsh literature is the 12th and succeeding centuries, when the energies of the nation were roused in the struggle with England. In this contest, the bards played a conspicuous part as agitators. After a long interval, we hear again of a great bard, Meylyn (1100); many follow, amongst whom Kynddalw (1200) deserves special mention, both as a poet (we have 49 pieces of his) and a patriot. Welsh poetry consists in—  
 1. Political lyrics, war-songs, songs in praise of chieftains, elegies on the same.  
 2. Religious hymns.  
 3. Pseudonymous poems, ascribed to Merlin (Merlin), the mythical enchanter, and Taliesin, the old bard, having generally the form of prophecies on the struggle between the Saxons and Welsh, and the ultimate triumph of the latter. Thus, in the *Avalennau* (or Apple-trees), attributed to Merlin, the Welsh nation is enigmatically represented under the image of 'seven score and seven sweet apple-trees,' whose fruits, princes (viz., the English) wish in vain to depile.  
 4. The Triads, short memorial (?) verses in which three remarkable events, subjects, or persons are respectively mentioned, hence the name, embracing history, theology, jurisprudence.  
 5. Dialogues of dramatic character. There were—apparently now lost—also miracle plays actually represented.

The only remarkable remnant of Cornish literature comes under this head, being three ecclesiastical plays of the 14th c.—the *Creation*, the *Passion*, and the *Resurrection*.—In Welsh prose, we have first the chronicles. Geoffrey's chronicle, though Latin, is thoroughly national; then there is that of Caradoc, who begins where Geoffrey leaves off; and the *Liber Landavensis*, a history of the bishops of Llandaff down to 1132. Further, we have the *Mabinogion* (Children's Tales), romantic stories. The most interesting of these refer to Arthur and his champions; the lady of the fountain, Peredur, Geraint (now revived by Tennyson), Arthur's boar-hunt. Amongst the non-Arthurian tales, special mention is deserved by the *Mabinogi of Taliesin*, interspersed with verses, relating the adventures, transformations into animal shape, and transmigrations of that bard. There are besides some scientific writings, a treatise on medicine, another on geometry, and one on Welsh prosody by Edeyrn (1260). This last, a grammatical essay in and on a vernacular tongue, is paralleled in the middle ages only by Icelandic literature, to which, upon the whole, the Welsh, although not quite so high, bears a marked resemblance.

*Concluding Remarks*.—Altogether, the Celts are a very important branch of our Indo-German family. The incessant wars of the Gauls bespeak at least activity of mind and body; the Irish missions have done a great deal for European civilisation; whilst the traditions of the Britons have deeply influenced medieval literature. The one great defect of the Celts is incapacity for political organisation. Their

ery enthusiasm, lively feeling, and vivid imagination, have ever prevented them from taking coolly and deliberately those measures which lead to national unity; hence it is that they gave way before the more practical Roman and Teuton. But while they lost their independence, and oftentimes their very language in the contest with the foreigner, whose strong hand moulded them into national unity, yet they reacted on him in their turn. They are fast disappearing by merging into the English; but if the quiet resolution, the sturdy common sense, the talent for public life, state organisation, and political dominion, that characterise the modern British nation, are altogether Teutonic—on the other hand, their genuine refinement of manner and feeling, and their high poetical susceptibilities, are to no small extent due to the admixture of Celtic blood.

**CELTIS.** See NETTLE-TREE.

**CEMBRA NUT AND CEMBRA PINE.** See PINE.

**CEMENTATION OF STEEL** is the process followed in the production of *Blistered Steel* (q. v.), or *steel of cementation*.

**CEMENTS.** A cement is a substance used to make the surfaces of solid bodies adhere to one another; it is applied in a liquid or viscous state, and hardens after the surfaces are brought together. When fused metals or alloys are used in this manner, they are called solders. There is a great variety of C. derived from animal, vegetable, and mineral substances. The animal C. are chiefly composed of elastine and albumen as their bases. Joiners' glue is an example. See GIUX. The binding materials of vegetable C. are gums, resins, and wax. The mineral C. are chiefly of lime and its compounds. In many C., animal, vegetable, and mineral substances are combined. The simplest of the mineral C. is plaster of Paris, which is used for uniting slabs of marble, alabaster, and many similar purposes. It is mixed with water to the consistence of thick cream, and then applied. This hardens rapidly, but is not very strong. Its hardening depends upon the true chemical combination of the water with anhydrous sulphate of lime, of which plaster of Paris is composed, and the formation thereby of a solid hydrate. The plaster of Paris may be mixed with thin glue, with diluted white of egg, or a solution of size or gum, instead of water, and is strengthened thereby.

Keene's marble cement is prepared by steeping plaster of Paris in a concentrated solution of alum, then recalcining and powdering. This powder is mixed with water in the same manner as plaster of Paris. It is used as a stucco for internal decorations, takes a high polish, and when coloured, forms beautiful imitations of mosaic, marbles, scagliola, &c.

A mixture of paper-pulp, size, and plaster of Paris in equal proportions, forms a useful cement, and is also used as a sort of papier-mâché for casting into architectural ornaments, &c.

Common mortar is one of the most important of the lime cements. It is composed of slaked lime, or mixture of this with sand; its hardening depends upon the slow formation of carbonate of lime by the absorption of carbonic acid from the atmosphere, and a partial combination with the silica of the sand. Cow-hair is sometimes mixed with it, to bind it when laid in masses. In order to obtain a fine smooth paste, which is required for good mortar, the lime should be slaked rapidly by adding about three parts of water to one of lime; if the quantity of water is too small, a coarser or semi-crystalline hydrate of lime is produced by the slaking. For the mode of applying mortar, see BRICKWORK.

Ordinary mortar, when exposed to the continuous

action of water, softens and disintegrates, and some of the lime dissolves away. Lime which contains 20 or 30 per cent. of clay, or finely divided silica, produces a mortar which is not liable to this softening, but possesses the property of hardening under water; such lime is called *hydraulic*, and the mortar made from it, *hydraulic cement* or mortar.

Puzzolana, a porous lava found at Pozzuoli, near Naples, has been long celebrated for its property of forming a hydraulic cement, when mixed with ordinary lime. It is mainly composed of silicates of alumina, lime, and soda. Portland cement, so named from its resemblance to Portland stone when dry, is made from clay found in the valley of the Medway, which is intimately mixed with the neighbouring chalk, and then burned. Roman cement is similar to the Portland, but of a darker colour; it contains a larger proportion of clay, and solidifies more rapidly. These C. should be mixed with a sufficient quantity of water, to form a moderately thick paste; the surfaces to which they are applied should be well wetted, and the cement kept slightly moist until it hardens. The solidification of hydraulic cements depends upon the combination of the lime with the silica and alumina forming, first a hydrated compound, and finally a true silicate. They expand slightly in solidifying.

The following receipts include some of the most useful and reliable C. applicable to the purposes specified: For water-tight joints, such as slate cisterns, aquaria, &c., and for uniting broken pieces of stone, and filling up metallic joints—take equal parts of red and white lead, and work them into a stiff paste with boiled linseed oil. When used for metal joints, it should be made rather thin, and both pieces of metal, as well as the washer, well smeared with it. This cement slowly hardens, but becomes ultimately of almost flinty hardness. We have before us an aquarium, holding fifteen gallons of water, made of plate-glass, cemented at the angles to mahogany columns with this composition. It has stood without leaking for above three years, in spite of much rough handling and moving about; and the cement is now so hard, that it is difficult to scratch it with a knife.

Cement composed of ox-blood thickened with finely powdered quicklime, is used by coppermiths, for securing the edges of rivets of copper boiler, and for steam-joints. Another cement for steam-joints is made with borings or turnings of cast-iron mixed with a little sal ammoniac and flower of sulphur. It should be stirred up with a small quantity of water, just sufficient to moisten it, then rammed into the joint, which should be bolted up as tightly as possible: 5 lbs. of iron borings to 2 oz. of sal ammoniac, and 1 oz. of sulphur, are the proportions recommended. A cement of this kind may be made of 4 lbs. iron borings, 2 lbs. pipe-clay, and 1 lb. of powdered earthenware fragments made into a paste with salt and water; or 2 parts litharge in fine powder, 1 part very fine sand, and 1 of quicklime that has slaked spontaneously in a damp place. These should be mixed, and kept from the air, and made into a paste with boiled linseed oil when about to be used. This is a valuable cement for steam-joints, for mending cracks in boilers, ovens, &c. Beale's Patent Fireproof Cement, for similar purposes, is composed of chalk, 12 parts; lime and salt, each 4 parts; Barnsley sand, 2 parts; iron filings or dust, 1 part; and blue or red clay, 1 part. These are ground and calcined together.

**Electrical Cement**—so called from its use in uniting the cylinders of electrical machines to their arm, and for a variety of similar purposes—is composed of 5 lbs. resin, 1 lb. each of bees'-wax and red ochre,

and 4 oz. of plaster of Paris. This is Singer's formula. A cheaper cement of this kind may be made from 14 parts rosin, 2 red ochre, and 1 plaster of Paris. These should be melted together till the frothing ceases, and the composition runs smoothly. This is applicable to a variety of purposes, where a cheap and tolerably adhesive cement is required. It will serve as bottle-wax for sealing the tops of corks; but this is usually prepared from 4 parts rosin with 1 of tallow or suet, and red ochre or other colouring matter added.

For mending earthenware and china, &c., a variety of C. are recommended. For ornamental glass or china, which is not subjected to heat or rough usage, Canada balsam that has evaporated until rather hard, is a very useful cement; from its transparency, it makes an almost invisible joint. The surfaces should be slightly warmed, and the balsam brushed over them, after which they should be kept pressed together for a short time. Thick copal or mastic varnish may be used in the same manner. Gum shell-lac, dissolved in spirits of wine in sufficient quantity to form a treacly liquid, forms a stronger cement than the above, but its colour is objectionable for some purposes. The shell-lac may be dissolved in naphtha, but is not equal to that in spirits of wine. The *liquid glue* sold in the shops is usually prepared in this manner; another kind is made of a mixture of the solutions of shell-lac and India rubber. The cement sold in sticks at fairs and in the streets of London by loquacious itinerants, is shell-lac or gum mastic fused and moulded into a convenient form, and is one of the most useful C. when properly applied, by heating the surfaces to be joined just sufficiently to fuse the shell-lac, and then smearing them thinly with it, and pressing them together. If shell-lac is heated much above its fusing-point, it becomes carbonised and rotten, and therefore great care must be used in fusing any composition of which it is an ingredient. The *marine glue*, a mixture of shell-lac and India rubber, is a remarkable cement, and when applied, as the last, with the precautions just alluded to, is so strong, that glass or china cemented with it, and then dashed on the ground, or otherwise broken again, will give way in any part rather than that cemented. This cement may be purchased ready made. For the mode of preparing it, see GLUE.

*Universal Cement*, used for the above and many other purposes, is prepared as follows: Curdle skim-milk with rennet or vinegar, press out the whey, and dry the curd at a very gentle heat, but as quickly as possible. When it has become quite dry, grind it in a coffee or pepper mill, and next triturate it in a mortar until reduced to a very fine powder. Mix this powder with  $\frac{1}{8}$ th of its weight of new dry quicklime, also in very fine powder, and to every ounce of the mixture add 5 or 6 grains of powdered camphor; triturate the whole well together, and keep it in small wide-mouthed phials well corked. When required, make it into a paste with a little water, and apply it immediately.

*Cheese Cement* is similar in composition and uses. Take two parts of grated cheese and one of quicklime in fine powder; beat these together with white of egg to form a paste, and use immediately.

The following is the reputed formula for preparing the *Armenian or Diamond Cement*, used by the Armenian jewellers for attaching diamonds, &c., without any metallic setting: 'Dissolve 5 or 6 bits of gum-mastic, each the size of a large pea, in as much rectified spirit of wine as will suffice to render it liquid; and in another vessel dissolve as much *isinglass*, previously a little softened in water—though none of the water must be used—in French brandy, or good rum, as will make a 2-ounce phial

of very strong glue, adding two very small bits of gum galbanum or ammoniacum, which must be rubbed or ground till they are dissolved. Then mix the whole with a sufficient heat. Keep the glue in a phial closely stopped, and when it is to be used, set the phial in boiling water.' This cement has a great reputation, but our experience does not confirm it. We have tried the above, and several other receipts, with very little success. We doubt whether the true method of preparing it is known in this country, and suspect that it still remains one of the oriental trade-secrets. White of egg, thickened with finely powdered quicklime, forms a useful cement, especially if the cemented article is warmed for a short time in a slow oven.

*Cutters' Cement*, used for fixing knives and forks in handles, is made of equal weights of rosin and brick-dust melted together; or, for a superior quality, 4 parts of rosin, 1 of bees-wax, and 1 of brick-dust.

*Mahogany Cement*, used for stopping cracks and holes in mahogany, may be prepared by melting 4 parts of bees-wax with 1 of Indian red, and as much yellow ochre as is found requisite to give the colour. If shell-lac be substituted for the bees-wax, and less red used, a much harder cement is made.

For *French Cement*, *Rice Glue*, and other light C. for joining paper articles and artificial flowers, see GLUE and PAPER.

**CEMETERY**, from the Greek, may mean any grave-yard, or other place of deposit for the dead; but it has lately acquired a special meaning, applicable to those extensive ornamental burial-grounds which have recently come into use in this and other European countries, as the practice of burying within and around churches was gradually abandoned (see BURIAL). The fine burial-grounds of the Turks, extending over large tracts adorned by cedars and other trees, may have suggested the plan to Europeans. It was first exemplified on a great scale in Paris, in which, as the largest walled town in Europe, the disposal of the dead was long a matter of extreme anxiety and difficulty. There are few considerable towns in Britain near which there is not at least one C., and the legislation mentioned under the head of BURIAL, has rendered their establishment, to a certain extent, a legal necessity. There was at first a natural feeling of regret at the prospect of deserting places of deposit for the dead so hallowed by ancient use and recent associations as the church and the churchyard. In many instances, however, the places thus professedly hallowed were in reality surrounded by degrading and disgusting circumstances. On the other hand, the new places of interment began to develop humanising and elevating influences, in beautiful trees and flowers, natural scenery, and works of monumental art. The new cemeteries are in many instances cheerful open places of recreation, and in them the place of rest for the dead has rather tended to improve than to undermine the health of the living. One of the oldest established and most celebrated of the European cemeteries, is that of *Père la Chaise* (q. v.), near Paris, the arrangements of which have been generally followed in the cemeteries of London and other English cities; with, however, this distinct difference, that the English cemeteries are divided into two portions—one consecrated for the burials of members of the Established Church, over whose remains the funeral service is read, and one unconsecrated for the burials of dissenters. In the Scottish cemeteries, of which there are good specimens at Edinburgh and Glasgow, no such distinctions exist. In the United States, as at Philadelphia and New York, there are cemeteries equal in point of arrangement to any in Europe.

CENCI—CENSORSHIP OF THE PRESS.

**CENCI**, BEATRICE, called ‘the beautiful parricide,’ was the daughter of Francesco Cenci, a wealthy Roman nobleman. According to Muratori (*Annales*, lib. x.), Francesco was twice married, Beatrice being his daughter by the first wife. After his second marriage, he treated the children of his first wife in a revolting manner, and was even accused of hiring bandits to murder two of his sons on their return from Spain. The beauty of Beatrice inspired him with the horrible and incestuous desire to possess her person; with mingled lust and hate, he persecuted her from day to day, until circumstances enabled him to consummate his brutality. The unfortunate girl besought the help of her relatives, and of Pope Clement VII. (Aldobrandini), but did not receive it; whereupon, in company with her step-mother, and her brother, Giacomo, she planned and executed the murder of her unnatural parent. The crime was discovered, and both she and Giacomo were put to the torture; Giacomo confessed, but Beatrice persisted in the declaration that she was innocent. All, however, were condemned, and put to death, August 1599, in spite of the efforts of the learned Farinaceus, who wrote out and presented to the pope an account of the crimes and infamous life of Francesco. Such is Muratori’s narrative. Other historians allege that neither Beatrice, her step-mother, nor her brother, had any part in the murder of Francesco, but that their condemnation was the result of an infernal plot hatched by two robbers, or by unknown persons whose instruments these were. It has also been stated, that the principal reason for refusing clemency was the avaricious desire, on the part of the pope, to confiscate the estates and possessions of the murdered man to the papal see; a statement in itself not improbable. In the Colonna Palace at Rome, there is still shewn an excellent painting of Beatrice, attributed to Guido. The story of Beatrice has been made the subject of a powerful tragedy by the poet Shelley.

**CENIS**, MONT, or MONTE CENISIO, a mountain-pass of the Alps, between Savoy and Piedmont, forming part of the water-shed between the valleys of the Doire and the Arc. The culminating point of the pass reaches an elevation of 6775 feet above the sea. Schist, limestone, and gypsum, in alternate beds, compose the strata of the mountain, the vegetation of which is rich in the rarer kinds of Alpine plants. Over the pass, a road was constructed (1803—1810) by the Chevalier Fabbroni, under Napoleon’s orders, at an expense of £300,000. This is the safest, and most frequented road across the Alps. Near the pass, a railway tunnel,  $7\frac{1}{2}$  miles long, was begun in 1857, and finished in December 1870.

**CE’NOBITES.** See MONACHISM.

**CENO’MYCOE.** SEE REINDEER MOSS.

**CE’NOTAPH** (Gr. *kenotaphion*, from *kenos*, empty, and *taphos*, a tomb), a monument which does not contain the remains of the deceased. They were originally erected for those whose bones could not be found, e. g., for those who had perished at sea. Latterly, the name was applied to tombs built by a man during his lifetime, for himself and the members of his family.

**CENSER** (Fr. *encensoir*, from Lat. *incendo*, to burn), a vase, or other sacred vessel, used for burning perfumes. See INCENSER. Censers were much used in the Hebrew service of the temple, but their form is not accurately ascertained, and it is probable that they varied in this respect, according to the occasions on which they were used. The C., called also a *thurible* (Lat. *thuribulum*, from *thus*, frankincense), is used in the Roman Catholic Church at

mass, vespers, and other offices. It is suspended by chains, which are held in the hand, and is tossed in the air, so as to throw the smoke of the incense in all directions. It varies very much in form, from a simple vase, or chafing-dish, covered by a perforated dome, to the ornamented structure represented in the woodcut.

Thurible.

**CENSORS**, the name of two Roman officers of state. The office was established by Servius Tullius, the fifth king of Rome. After the expulsion of the kings, it was held by the consuls, special magistrates not being appointed till 443 B.C. It continued to be filled by patricians till 351 B.C., when C. Marcus Rutilus, a plebeian, was elected. Twelve years later, it was enacted that one of the C. (there were always two) must be a plebeian. In 131 B.C., both C. for the first time were plebeians. The C. were elected in the *comitia centuriata*, presided over by a consul. The term of office at first lasted five years, but was shortly afterwards limited to eighteen months. The censorship was regarded as the highest dignity in the state, except the dictatorship. It was a sacred and irresponsible magistracy, whose powers were vast and undefined, and whose decisions were received with solemn reverence. The duties of the C. were threefold. 1. The taking of the census, or register of the citizens and of their property. 2. The *regimen morum* (regulation of morals). 3. The administration of the finances of the state. The taking of the census (Lat. *censo*, to value, to take an account of) was originally their sole function (hence their name), and was held in the Campus Martius, in a building called *Villa Publica*. The *regimen morum* was the most dreaded and absolute of their powers. It grew naturally out of the exercise of the previous duty, which compelled them to exclude unworthy persons from the lists of citizens. Gradually, the superintendence of the C. extended from the public to the private life of citizens. They could inflict disgrace (*ignominia*) on any one whose conduct did not square with their notions of rectitude or duty. For instance, if a man neglected the cultivation of his fields, or carried on a disreputable trade, or refused to marry, or treated his family either too kindly or too harshly, or was extravagant, or guilty of bribery, cowardice, &c., he might be degraded, according to his rank, or otherwise punished. The administration of the finances of the state included the regulation of the *tributum*, or property-tax; of the *vectigalia*, such as the tithes paid for the public lands, salt-works, mines, customs, &c., which were usually leased out to speculators for five years; the preparation of the state budget, &c.—See Rovers, *De Censorum apud Romanos Auctoritate et Existimatione* (Utrecht, 1825).

**CENSORSHIP OF THE PRESS**, the term generally applied to the arrangements for regulating what may be printed, in countries where the press is not free. The simplest form of C. is when a public officer—the censor, or licenser, as he is sometimes called—reads over the MS. to be printed, and after striking out any objectionable passages, certifies that the work may be printed. Thence it is common in old books to see the word *imprimatur*—let it be printed, followed by one or more signatures.

Though it has its name from an analogy with the functions of the Roman censor, the C. did not come into operation until the invention of printing. It was common to all European countries, Great Britain included. The C. was established by act of parliament in 1662, 13 Char. II., c. 33: 'An act for preventing the frequent abuses in printing seditious, treasonable, and unlicensed books and pamphlets, and for regulating of printing and printing-presses.' This was a temporary act, renewed from time to time; and its renewal was refused in 1693, owing to a quarrel between the House of Commons and the licenser. Since that time there has been, generally speaking, no restriction in this country on what any man may publish; and he is merely responsible to the law, if in his publication he should commit any public or private wrong. See LIBEL, LAW OF; see also PRESS, FREEDOM OF THE; BOOK-TRADE; and COPYRIGHT.

CENSUS means, in this country, the periodical counting of the people. It is a Latin word applied by the Romans to one of the functions of their censors (q. v.). They had to enumerate the people, but only for immediate purposes of taxation, so that no accounts of the results of such enumerations has been preserved. The idea of ascertaining the numbers of the people, and the proportions in which they are divided according to sex, age, profession, rank, and the like, as statistical information, is of late origin. The first C. of Britain was taken in the first year of the present century—1801. From that time it has been taken at each period of ten years. An attempt, but a rather unsuccessful one, was made to take the statistics of Ireland in 1811. Ten years after, the attempt was repeated, but the accuracy of the bare enumeration it furnished was doubtful. That of 1831, which was an improvement, was corrected three years after, in order that it might form the basis of a new system of education. The four subsequent enumerations have been very trustworthy, and have furnished besides valuable statistics regarding the agricultural condition of the country. The system of registration under a registrar-general, established in England in 1836, has given considerable assistance by supplying a staff for carrying out the enumeration, and also by affording the means of checking the C. A similar registration system was extended to Scotland in 1854, of which the C. of 1861 and 1871 have had the advantage. A C. must be taken for the whole empire simultaneously, otherwise it cannot be accurate. The practice is for the enumerating officer in each petty district to leave a schedule at each house, which he receives filled up, aiding, when necessary, in the filling up. The C. of 1851 was taken for the night of the 31st March. This C. supplied important, but not altogether satisfactory information, as to the educational and ecclesiastical condition of the country, elements of which the latter has been left out in 1861 and 1871. The C. of 1861 was taken for the night of Sunday, 7th April; that of 1871 for the night of Sunday, 2d April, a schedule being left in each house on the Saturday, and called for on Monday. The schedule of 1871 contained compartments for 'particulars of the name, sex, age, rank, profession or occupation, condition, relation to head of family, and birthplace of every living person' who passed the night of Sunday in the house; whether any was blind, deaf, dumb, imbecile, or lunatic; and how many between the ages of 6 and 13 were receiving education at school, or from tutors or governesses at home. Almost all civilised nations now take a census at regular intervals. In France, it is taken every five years, the last being in 1872; in Belgium, every three years, the last being in 1873; in Austria, the same, the

last being in 1872; in the United States, every ten years, the last being in 1870.

CENT, and CENTIME (Lat. *centum*, a hundred), names of coins. The Dutch cent is a copper coin =  $\frac{1}{10}$ th of the guilder, which is equal to 1s. 8d. sterling. In the United States of America, the cent is a copper coin =  $\frac{1}{100}$ th part of the dollar, or nearly one halfpenny English. The Centime is the 100th of the French franc (q. v.), and is of the value of  $\frac{1}{100}$ th of an English penny.

CENTAURÉA, a genus of plants of the natural order *Compositæ*, sub-order *Cynaraceæ*, containing many species of annual and perennial herbaceous plants, chiefly natives of the temperate and cold regions of the eastern hemisphere. Six or seven species are natives of Britain, some of them common weeds, whilst some species appear among the frequent ornaments of flower-gardens.—The

BLUE-BOTTLE, or CORN BLUE-BOTTLE (*C. cyanus*), is common in cornfields in Britain and other parts of Europe, and has now become frequent also in similar situations in America, and indeed over the greater part of the world. It is an annual, growing to the height of about two feet, and producing its flowers in July and August. The florets of the disk are small and purple; those of the ray are few, comparatively large, and of a bright blue. Its flowers have long been much used in wreaths and garlands. It is common in gardens, with flowers variously modified by cultivation. Water distilled from the flowers of the blue-bottle was at one time in high repute as a remedy for weak eyes. The juice of the florets of the disk, with a little alum, dyes a beautiful and permanent blue.—The large Blue-bottle (*C. montana*), a native of Central Europe, is still more frequently cultivated in flower-gardens. Its flowers are considerably larger, and it is a perennial.—SWISS SULTAN (*C. moschata*), a native of the Levant, with fragrant flowers, is also common in flower-gardens. It is an annual or biennial.—Several species, having the involucle spiny, bear the name of STAR-THISTLE. The common STAR-THISTLE (*C. calcitrapa*) is a native of the southern parts of Britain and of Europe.—The Common or Black KNAPEWEED, called in Scotland Horse Knot (*C. nigra*), is abundant in the meadows and pastures of most parts of Britain, and is a troublesome perennial weed, difficult of extirpation. *C. Jacea*, also called KNAPEWEED, more rare in Britain, is very common in some parts of Europe, and its bitter astringent root, and indeed the whole plant, were formerly used in medicine. It affords a beautiful bright yellow dye, almost as good as Saw-wort.—The name C. has its origin in an ancient legend concerning the cure of a centaur by one of the species.

CENTAURS ('bull-killers'), a wild race of men who inhabited, in early times, the forests and mountains of Thessaly, and whose chief occupation was bull-hunting. Homer, the first who mentions them, describes them merely as savage, gigantic, and

Blue-bottle (*Centauraea cyanus*).

covered with hair. They do not appear as monsters, half-man and half-horse, until the age of Pindar. The C. are celebrated in Greek mythology on

Centaur.—From the Elgin Marbles.

account of their war with the *Lapithæ* (q. v.), and their contest with Hercules. The fact lying at the bottom of Pindar's myth may refer to the impression which the old bull-hunters of Thessaly, who spent almost their whole life, it is said, on horseback, first made on some of the neighbouring tribes—viz., that the man and the horse were one creature, which, at least, we know was the opinion entertained by the Mexicans of the Spanish cavalry. On account of their resemblance to the Satyrs, the C. were at a later period introduced into the artistic representations of the Bacchic worship.

CENTAURUS, the *Centaur*, one of the constellations in the southern hemisphere, represented on the celestial globe by a form half-man and half-horse. The stars in this constellation are, according to Ptolemy's catalogue, 37 in number; according to the Britannic catalogue, 35. It contains the stars  $\alpha$  Centauri and  $\beta$  Centauri, both of the first magnitude.

CENTAURY (*Erythraea*), a genus of plants of the natural order *Gentianaceæ*, having a funnel-shaped regular 5-partite corolla. The species are pretty little annuals, natives chiefly of the temperate parts of Europe and Asia, with pink or rose coloured flowers. They possess the tonic and other medicinal virtues of gentian, and although not frequently administered by physicians, are an important domestic medicine; and the tops are collected when the plant is in flower, by the country people both in England and on the continent of Europe, to be employed in cases of dyspepsia, in intermittent fevers, and as a vermifuge. They contain a substance called *Centaurine*, the hydrochlorate of which is said to be an excellent febrifuge.—The Common C.

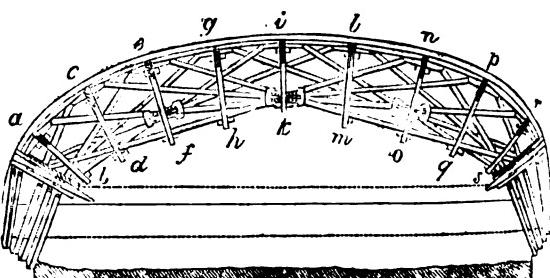

(*E. Centaurium*) is the species most frequent in Britain; a plant of eight inches to a foot in height, with flowers collected in loose heads, growing in dry pastures. Two or three other species are found on sandy sea-shores. Nearly allied to these is the AMERICAN C. (*Sabbatia angularis*), an annual plant with an erect quadrangular stem, extensively distributed throughout the United States and Canada, and much used in the domestic practice of America, as a prophylactic against autumnal fevers, in strong infusions and large and repeated

doses. The name C. owes its origin to the same legend with the name *Centauræ*, although appropriated to plants so different.

CENTENES. See TERRAC.

CENTERING, the framework upon which an arch or vault of stone, brick, or iron is supported during its construction. The simplest form of C. is that used by masons and bricklayers for the arches of common windows and doors. This is merely a deal-board of the required shape, upon the curved edge of which the bricks or stones of the arch are supported until they are keyed in. In building bridges or other structures where arches of great span are to be constructed, the C. is usually made of framed timbers, or timbers and iron combined. The arrangement of the timbers should be such, that the strain upon each shall be mainly a thrust in the direction of its length, for if the strain were transverse, a comparatively slight force would snap it, and if a longitudinal pull, the whole structure would be no stronger than the joints holding the pieces of timber together. In arches of great span, such as that of Waterloo Bridge, London, a longitudinal pulling strain is almost inevitable in some parts, as a beam of great length would bend to some extent under a thrusting strain. In such cases great skill and care are demanded in the designing and construction of the joints. As an arch is built from the piers towards the keystone, the weight upon the haunches during construction tends to push the crown upwards, and therefore the problem of designing a framed C. involves the resistance of this tendency, as well as the supporting of the weight of the materials.

The annexed figure of the C. of Waterloo Bridge, designed by Rennie, presents a fine example of the fulfilment of these requirements. It will be easily seen that a weight upon *ap* and *as* will be resisted by direct thrust upon the beams passing obliquely downwards from these parts; one of each pair of these oblique beams thrusts outwards, and is directly supported by the abutments; the other thrusts inwards towards *k*, the yielding of which is prevented by the longitudinal pull of the lower and longer oblique beams *kg*, *kr*, *kd*, *ka*, &c. In this, and other modern structures, cast-iron shoes

Centering of Waterloo Bridge.

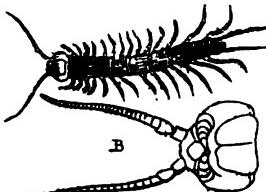

have been successfully used for the tying joints subject to the longitudinal pulling strain. The flexible C., so called from its yielding at the joints, and varying its form with the load put upon it, is now abandoned. It was chiefly used by French engineers. That of Perronet for the bridge of Neuilly is a celebrated example.

Occasionally, when a very great span is required, and the navigation will permit, piers are built, or piles are driven, to support the C., and the design is much simplified thereby.

Cupolas like the Pantheon and St Peter's at Rome, St Paul's in London, or the flat domes of the Turkish mosques, require very effective centerings.

**CENTIGRADE.** See THERMOMETER.

**CENTIPEDE** (*Scolopendra*), a genus of *Myriapoda* (q. v.), having a long slender depressed body, protected by coriaceous plates, 21 pair of legs, distinct eyes, four on each side, and antennae with 17 joints. The name is, however, popularly extended to species of nearly allied genera. Centipedes run nimbly, feed on insects, and pursue them into their lurking-places. They have not only a pair of horny jaws, like those of insects, but also another pair of organs closely connected with the mouth, and which are regarded as transformed legs, dilated and united at the base, terminated by a strong hook, and pierced beneath the extremity for the emission of a venomous fluid, which makes their bite quickly fatal to insects, and in the case of the larger species, very painful and even dangerous.

Centipede :  
B, head, magnified.

to the larger animals and to man. The common C. of tropical America (*S. morsitans*) is often nine inches or a foot in length. A species found in the south of Europe (*S. cingulata*) is nearly as large, but its bite does not seem to be equally venomous. It may seem strange that creatures of such aspect as centipedes should ever have been thought of as human food, but Humboldt, in his Personal Narrative, tells us that he has seen Indian children of the tribe of the Chuymas draw large centipedes out of the earth and eat them.—The most common British C. is not a true *Scolopendra*, as that genus is now restricted, but is very nearly allied to it. It is known to naturalists as *Lithobius forficatus*. It is very plentiful under stones, &c., in summer. Another allied genus, *Geophilus*, of more numerous joints and slender form, contains some species which are occasionally phosphorescent, one of which, *G. longicornis*, yellow, with a rust-coloured head, is very abundant at the roots of turnips, &c. It is supposed, however, to be rather useful than injurious, preying on the destructive larvae of insects.

**CENTLIVRE, SUSANNA**, an English dramatic authoress, was the daughter of a Lincolnshire gentleman, named Freeman, born (most probably) in Ireland, about 1680. Her early history is obscure; but such were her wit and beauty, that on her arrival in London, though a destitute orphan, and only 16 years of age, she won the heart of a nephew of Sir Stephen Fox, who, however, died shortly after their marriage. Her second husband, an officer named Carroll, lost his life in a duel. Left in extreme poverty, his widow endeavoured to support herself by writing for the stage, and after producing a tragedy called *The Perjured Husband* (performed first in 1700), made her appearance on the stage. She afterwards married (1706) Joseph Centlivre, principal cook to Queen Anne, with whom she lived happily until the time of her death, December 1, 1723. Her plays—*The Busbody* (of which the leading character, 'Marpot,' is highly amusing), *A Bold Stroke for a Wife* (1717), and *The*

*Wonder* (1714)—though not distinguished by purity of style or truthfulness of portraiture, are lively in their plots, and have kept their place on the stage.

**CENTO** (from Gr. *κεντρόν*, patchwork), a name applied to literary trivialities in the form of poems manufactured by putting together distinct verses or passages of one author, or of several authors, so as to make a new meaning. After the decay of genuine poetry among the Greeks, this worthless verse-manufacture came into vogue, as is proved by the *Homero-centones*, a patchwork of lines taken from Homer (edited by Teucher at Leipsic, 1793); but it was much more common among the Romans in the later times of the Empire, when Virgil was frequently abused in this fashion, as in the *C. Nuptialis* of Ausonius (who gives rules for the composition of the C.), and especially in the *C. Virgilianus*, constructed in the 4th c. by Proba Falconia, wife of the Proconsul Adelius, and giving, in Virgil's misplaced words, an epitome of sacred history! The C. was a favourite recreation in the middle ages. In the 12th c., a monk named Metellus contrived to make a *cauda* of spiritual hymns out of Horace and Virgil.

**CENTO**, a town of Central Italy, 16 miles northwest of Bologna, is pleasantly situated on a fertile plain near the Reno. It is celebrated as the birthplace of the famous painter Guercino, whose house, adorned with paintings, is still preserved; and in the church of C. are many of his works. Pop. about 5000.

**CENTRAL FORCES** are those which cause a moving body to tend towards some point or centre, called the centre of force or motion. The doctrine of C. F. has for its starting-point the first law of motion—viz., that a body not acted on by any external force will remain at rest, or move uniformly in a straight line. It follows from this law, that if a body in motion either changes its velocity or direction, some external force is acting upon it. The doctrine of C. F. considers the paths which bodies will describe round centres of force, and the varying velocity with which they will pass along in these paths. It investigates the law of the force round which a body describes a known curve, and solves the inverse problem, and many others, the general statement of which could convey no clear idea to the unmathematical reader. As gravity is a force which acts on all bodies from the earth's centre, it affords the simplest general illustration of the action of a central force. If a stone be alung from a string, gravity deflects it from the linear path which it would otherwise pursue, and makes it describe a curved line which we know would, in *vacuo*, be a parabola. Again, the moon is held in her orbit round the earth by the action of gravity, which is constantly preventing her from going off in the line of the tangent to her path at any instant, which she would do, according to the first law of motion, if not deflected therefrom by any external force. To that property of matter by which it maintains its state of rest or motion, unless acted upon by other matter, has been given the name *inertia*.

We will now explain how, through the action of a central force, a body is made to describe a curved path. Suppose it to have moved for a finite time, and conceive the time divided into very small equal parts; and instead of the central force acting constantly, conceive a series of sudden impulses to be given to the body in the direction of the centre, at the end of each of the equal intervals, and then observe what, on these suppositions, will happen. Let S (see fig. 1) be the centre, and let the original motion be from A, on the line AB, which does not

pass through S. In the first interval, the body will move with a uniform velocity, say from A to B. In the second, if acted on by no force, it would move

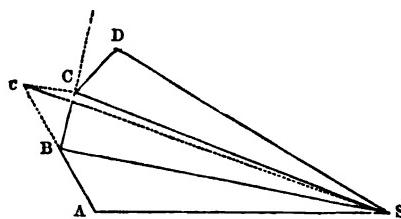

Fig. 1.

on in AB produced to c, Bc being  $=$  AB. But when it arrives at B, it receives the first sudden impulse towards S. By the composition of velocities (q. v.), it will move now with a new but still uniform velocity in BC instead of Bc, BC being the diagonal of the parallelogram of which the sides represent its impressed and original velocity. Having reached C at the end of the second interval, it receives the second impulse towards S. It will now move in CD instead of in BC produced. If, then, we suppose the periods of time to be indefinitely diminished in length, and increased in number, the broken line ABCD will become ultimately a continuous curve and the series of impulses a continuous force. This completes the explanation.

Going back, however, on our suppositions, we may here establish Newton's leading law of central forces. That the body must always move in the same plane, results from the absence of any force to remove it from the plane in which at any time it may be moving. The triangles ASB and BSC are clearly in the same plane, as the latter is on that in which lie the lines Bc and BS. Also, since the triangles ASB, BSc are equal, being on equal bases, AB, Bc, and triangle BSC = triangle BSc, as they are between the same parallels, cC and BS, it follows (by Euclid I. 37) that ASB = BSC. So BSC = CSD; and so on. In other words, the areas, described in equal times by the line (called the radius vector) joining the centre of force and the body, are equal. As this is true in the limit, we arrive, by the composition of the small equal areas, at the law: That the areas described by the lines drawn from the moving body to the fixed centre of force, are all in one plane, and proportional to the times of describing them. Very few of the laws of C. F. are capable of being proved like the preceding, without drawing largely on Newton's lemmas, with which we shall not suppose the reader to be acquainted.

*Centrifugal and Centripetal Force.*—We have shewn that a body continually drawn to a centre, if it has an original motion in a line that does not pass through the centre, will describe a curve. At each point in the curve, it tends, through its inertia, to recede from the curve, and proceed in the tangent to it at that point. It always tends to move in a straight line in the direction in which it may at

any time be moving, and that line, by the definitions of a tangent and of curvature, is the tangent to the curve at the point. At the point A (see fig. 2), it will endeavour to proceed in AD: if nothing hindered it, it would actually proceed in that line,

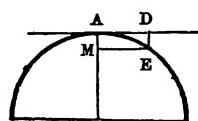

Fig. 2.

so as, in the time in which it describes the arc of the

curve AE, to reach the point D, and thus recede the length DE from the curve; but being continually drawn out of its direction into a curve by a force to a centre, it falls below the point D by the distance DE. The force which draws it through this distance is called the centripetal force, and that which would make it recede in the same time through the distance DE from the curve is called the centrifugal force. It may be remarked that the centrifugal force is not, like the centripetal, an impressed or external force acting on the body. It is simply the assertion of the body's inertia under the circumstances produced by the centripetal force.

Many familiar illustrations will occur to the reader of the action of what is called the centrifugal force. A ball fastened to the end of a string, and whirled round, will, if the motion is made sufficiently rapid, at last break the string, and fly off. A glass of water may be whirled so rapidly that, even when the mouth is presented downwards, the water will still be retained in it, by the centrifugal force pressing it up against the bottom of the glass. The centrifugal action will be found to increase with the velocity. In all cases of a body moving in a circle, the force, it can be proved, varies as the square of the velocity of the body at the moment, and in the inverse ratio of the radius. As in this case the velocity varies as the radius inversely, it follows that the force is as the inverse cube of the radius. As in the case of circular motion the body always is at the same distance from the centre, it follows that the centrifugal and centripetal forces are equal at all points of a circular orbit. The general law for all orbits is, that the centrifugal force varies as the inverse cube of the distance from the centre. As the attractive force of gravitation varies as the inverse square of the distance, it may hence be shewn that the centrifugal force gives perfect security, notwithstanding the constant attraction of the sun, that the planets, so far as that attraction is concerned, will never fall into the sun.

The doctrine of C. F. owes more to Kepler and Sir Isaac Newton, of whose philosophy it makes a considerable branch, than to all the rest of the philosophers, though almost all the leading mathematicians have contributed to it. The doctrine of centrifugal forces was first mentioned by Huygen, at the end of his *Horologium Oscillatorium*, published in 1673; but Newton was the first who fully handled the doctrine, at least so far as regards the conic sections.

CENTRALISATION, a term which has lately come into general use for expressing a tendency to administer, by the sovereign or the central government, matters which had been previously under local management. We cannot properly use the term towards an established despotism, for there everything is already directed from the centre. The legitimate application is to a state of change from local to central management—a change in the opposite direction would, on the same principle, be called localisation. Of this latter change, however, it can scarcely be said that we have any recent example, unless it may be found in the systems of self-government lately communicated to some of the British colonies. Ever since the existing European states began to grow out of the chaos of the fall of the Roman empire, there has been a continued progress in centralisation. That empire itself was, however, the greatest instance of C. which the world has yet seen. In it the numerous municipalities and other local organisations originally existing in Italy, and communicated to the colonies, were entirely centralised. The empire, such as it had been in the days of Constantine, was the type after

## CENTRALISATION—CENTRE OF GRAVITY.

which the European monarchs, such of them especially as became more powerful than their neighbours, were ever striving; and a few of them, such as Charlemagne, and, long afterwards, Charles V., seemed to have almost restored it. In this country, we trace C. from the time when there were about a dozen kings in Britain, and perhaps as many in Ireland, till the united kingdom came under the rule of one monarch. A subsidiary C. at the same time made silent progress, absorbing the feudal power of the aristocracy and the municipal privileges of the corporations. In other countries—as, for instance, in France, notwithstanding her desperate struggles for freedom, this process of C. has tended to a pure irresponsible despotism. With so sad a result before their eyes, a distrust of C. has not naturally been felt by some inhabitants of Great Britain. But the British constitution possesses a grand remedy, which turns the process to good use instead of mischief. While administrative authority has been centralising in the crown, the controlling power of parliament has been increasing at a more rapid ratio, so that the vesting of a function in the crown or central government, means the putting it under the control of parliament, and especially of the peoples' representatives in the House of Commons. There is nothing done in any of the offices under the government for which a secretary of state, or some other member of the ministry, may not at any time be called to account in parliament. The efficiency of this control was in a manner proved by one or two instances in which offices with central powers were created, without being connected with any of the great state departments. There were, for instance, the English Poor-law Board, and the Board of Health. Both created much discontent and outcry about C., and it was found necessary to transfer their functions to the great government departments, the heads of which are immediately responsible to parliament. It is not the policy of this country in any case to abolish local management, but rather to aid and direct it from the central authority. The constituents of local bodies are often disinclined to watch or control them, and the business falls into the hands of incapable or designing men, or is otherwise mismanaged. A very little central help—especially from a quarter where the proceedings of other bodies of the same kind are known—remedies such defects. One of the methods in which the government has of late been in use to exercise its central power, has been by the appointment of inspectors, who make reports which are laid before parliament. This is, in reality, nothing more than a method of concentrating public opinion on the proceedings inspected and reported on, and as such it is very efficacious.

**CENTRE OF GRAVITY** is that point in a body or system of bodies rigidly connected, upon which the body or system acted upon only by the force of gravity, will balance itself in all positions. Though the action of gravity enters this definition, many of the properties of the point are independent of that force, and might be enunciated and proved without conceiving it to exist. By some, accordingly, the point has been called the *centre of magnitude*, and by others, the *centre of parallel forces*. Such a point exists in every body and system, and only one such point. Every body may be supposed to be made up of a multitude of minute particles connected by cohesion, and so far as its balance under gravity is concerned, each of these may be supposed to be removed, and its place occupied by a force proportioned to its weight. Instead of the body, on these suppositions, we should then have a system of parallel forces, the lines from the various particles to the earth's centre being regarded

as parallel. But a system of parallel forces (see PARALLEL FORCES) has a single resultant acting through a fixed point, whose position is independent of the position in space of the points of application of the component forces, provided their relative positions in the system continue unchanged. This point is the C. of G.; and if it be supported, it is clear that the body will balance itself upon it in all positions. The same reasoning obviously applies to any system of bodies rigidly connected. It is usual to demonstrate this and the general rule for finding the C. of G. by proving it first in the case of two heavy particles forming a body or system, and then extending the proof to the case of any number of particles. Let P and Q (see fig. 1) be two heavy particles. Join P and Q, and divide the line PQ in C, so that weight of P : weight of Q :: CQ : CP. Then C will be the C. of G. of P and Q. Draw ACB horizontal, and PM, QN vertical, meeting AB in M and N. Then if P and Q represent the weights of P and Q, we have  $P : Q :: CQ : CP$ . But  $CQ : CP :: CN : CM$  by similar triangles. Therefore

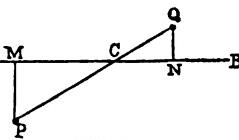

Fig. 1.

$P : Q :: CN : CM$ , and  $P.CM = Q.CN$ . P and Q, therefore, are balanced about C. See BALANCE and LEVER. This is true in all positions of P and Q, for no assumption was made as to their positions. C, therefore, is their centre of gravity. Also, we may conceive P and Q to be removed (see PARALLEL FORCES), and in their stead a particle at C equal to them taken together in weight. If, now, the system contained three, it is clear how we should proceed to find its centre of gravity; having found the C. of G. of two, we should consider the system as formed of two—viz., the equivalent of the first two at their C. of G., and the third, when the case would fall under that already treated; and so on, extending the rule to a system containing any number of particles. Apart from this rule, however, it is possible, in the case of most regular homogeneous bodies, to fix upon their centres of gravity from general considerations. The C. of G. of a straight line, for instance, must clearly be in its middle point. So the C. of G. of a uniform homogeneous cylinder must be in the middle point of its axis. It must be in the axis, for the cylinder clearly is equally balanced about its axis. It must also be somewhere in its middle circular section, for it will balance itself on a knife-edge under that section. It must, therefore, be in the point where that section cuts the axis, or in the middle of the axis. The C. of G. of a uniform material plane triangle may be found from similar considerations. The triangle ABC (see fig. 2) may be supposed to be made up of uniform material lines parallel to its base AB; each of these will balance upon its middle point. The whole triangle, therefore, will balance upon the line CD, which bisects the base AB and all lines parallel to it. In

the same way, the triangle will balance upon the line AE, bisecting BC. But if a figure balances itself upon a line, its C. of G. must lie in that line. The C. of G. of the triangle is therefore in CD, and also in CB. It must therefore be at g where these lines intersect, g being the

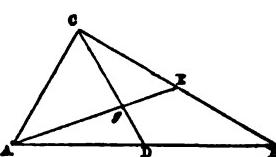

Fig. 2.

## CENTRE OF GYRATION—CENTRE OF PRESSURE.

only point they have in common. Now, by geometry, we know that  $g$  divides  $CD$ , so that  $Cg = \frac{2}{3} CD$ . Hence the rule for finding the C. of G. of a triangle: Draw a line from the vertex, bisecting the base, and measure off  $Cg$ , two-thirds of the line.  $g$  is the centre of gravity. By a similar method, the C. of G. of a great number of figures may be determined.

The above method applies only where the figure of the body is regular, and its mass homogeneous. But many bodies, besides being irregular, are formed by the agglomeration of particles of different specific gravities. Of these, the C. of G. can be found only by experiment, though not always satisfactorily. Let the body be suspended by a string, and allowed to find its position of equilibrium. The equilibrium being due to the tension of the string counter-balancing gravity, it follows that the tension is in the same line with that on which gravity acts on the body. But the tension acts on the line of the string, which therefore passes through the centre of gravity. Mark its direction through the body. Suspending it then by another point, we should ascertain a second line in which lies the centre of gravity. The C. of G., then, must be where these lines intersect.—For the effect on the stability of bodies of the position of the C. of G., see STABILITY.

**CENTRE OF GYRATION** is the point at which, if the whole mass of a body rotating round an axis or point of suspension were collected, a given force applied would produce the same angular velocity as it would if applied at the same point to the body itself. The C. of G. bears a strong analogy to the centre of oscillation. The cases differ only in this, that in the latter the operating forces are supposed to act at every point of the moving body, while in the former there is only one force acting upon one point. The C. of G. is found by the following rule: Divide the moment of inertia of the rotating mass by the mass of the body, and extract the square root of the quotient. The result is the distance of the point from the axis of rotation. The moment of inertia, it may be stated, is the sum of the products of the weight of each point of the mass by the square of the perpendicular distance of that point from the axis.

**CENTRE OF MAGNITUDE or FIGURE** (see CENTRE OF GRAVITY). C. of M. is the point on which plane figures and curved surfaces would balance themselves, supposing their areas to have weight. Thus, the centre of a circle is its centre of magnitude. Otherwise, C. of M. or F. is a point so situated that all straight lines passing through it, and terminated by the circumference or superficies of the figure or surface are bisected in it.

**CENTRE OF OSCILLATION.** Referring to the article PENDULUM, the reader will see that the time of a pendulum's vibration increases with its length, being always proportioned to the square root of its length. This is strictly true only of the simple pendulum, in which the pendulous body is supposed to have no determinate magnitude, and to be connected with the point of suspension by an inflexible wire without weight. If, however, the vibrating body have a determinate magnitude, then the time of vibration will vary, not with the square root of its length, but with the square root of the distance from the axis of suspension of a point in the body called its centre of oscillation.

If each part of the vibrating body were separately connected with the axis of suspension by a fine thread, and entirely disconnected from the rest of the body, it would form an independent simple pendulum, and oscillate as such—the time of each vibration being as the square root of the length of its thread. It follows that those particles of the

body which are nearest to the axis of suspension would, as simple pendulums, vibrate more rapidly than those more remote. Being connected, however, as parts of the solid body, they vibrate all in the same time. But this connection does not affect their tendencies to vibrate as simple pendulums, and the motion of the body which they compose is a compromise of these tendencies of its particles. Those nearest the axis are retarded by the more remote, while the more remote are urged on by the nearer. Among these particles there is always one to be found in which the accelerating and retarding effects of the rest are mutually neutralised, and which vibrates in the same time as it would if it were unconnected with the other parts of the body, and simply connected by a fine thread to the axis of suspension. The point in the body occupied by this particle is its centre of oscillation. By this C. of O. the calculations respecting the vibration of a solid body are rendered as simple as those of a molecule of inconsiderable magnitude. All the properties which belong to a simple pendulum may be transferred to a vibrating body of any magnitude and figure, by considering it as equivalent to a single particle of matter vibrating at its centre of oscillation.

The determination of the position of the C. of O. of a body usually requires the aid of the calculus. It is always further from the axis of suspension than the centre of gravity is, and always in the line joining the centre of gravity and the point of suspension, when the body is suspended from a point. The rule for finding it in such a case is: If  $S$  be the point of suspension, and  $O$  the C. of O.,  $SO = \frac{x (m^2)}{MS}$ ; or it is the quotient obtained by dividing the moment of inertia of the body by the product of its mass into the distance of its centre of gravity from the point of suspension.

**CENTRE OF PELLUSSION.** The C. of P. of a body or a system of bodies revolving about a point or axis, is that point in it, which striking an immovable object, the whole mass shall not incline to either side, but rest, as it were, in equilibrio, without acting on the centre or axis of suspension. If the body be moving freely, then the C. of P. is that point in it at which its whole impetus is supposed to be concentrated. In this case, if the body struck with its C. of P. an immovable obstacle, and if it were perfectly rigid and inelastic, it would come to perfect repose; whereas, if it struck the obstacle with any other point, a rotatory motion would be produced in it. When the body is moving freely, and there is no rotatory motion, the C. of P. coincides with the centre of gravity. If the body be moving round a point or axis of suspension, the C. of P. coincides with the centre of oscillation. The more complicated case of a body rotating round an axis within it, would require, for its explanation, analytical formulæ which cannot conveniently be translated into ordinary language. There are many positions which the axis may have in which there will be no C. of P.—i. e., there will be no direction in which an impulse could be applied without producing a shock upon the axis. One case of this sort is that of the axis being a principal axis through the centre of gravity.

**CENTRE OF PRESSURE.** The C. of P. of any surface immersed in a fluid is the point in which the resultant of the pressures of the fluid on the several points meets the surface. When the bottom of a vessel containing fluid, or when a plane immersed in fluid, is horizontal, the pressure on every point of it is the same, being that due

## CENTRIFUGAL AND CENTRIPETAL—CEPHALOPODA.

to the weight of the column of fluid standing above the bottom or plane. In either case, the pressures at the different points obviously form a system of equal parallel forces, whose centre will be the centre of gravity of the bottom or plane, their resultant passing through this point being the sum of all their forces. But when the plane is inclined at any angle to the surface of the fluid, the pressure is not the same at all points, but is obviously greater at the lower than at the upper points, for the lower have to support taller columns of the fluid. The resultant of these forces, then, will not pass through the centre of gravity of the surface, but through a point below it. This point is the C. of P., and evidently will lie below the centre of gravity for all fluids in which the pressure increases with the depth. If the surface pressed upon form part of the containing vessel, and be supposed movable, it will be kept at rest by a pressure equal to the sum of the fluid pressures applied at the C. of P., and acting in the opposite direction. In the case of a vessel with a parallelogram for one side, the C. of P. is at the distance of one-third of the height from the bottom. In the case of a triangular vessel whose base is at the bottom, it is one-fourth of the height only.

**CENTRIFUGAL AND CENTRIPETAL** are terms used in Botany to designate two different kinds of inflorescence, or modes of flowering of plants. When the flower-bud which terminates the floral axis, and is central in the inflorescence, is the first to expand—in which case the others are developed in succession from the centre outwards—the inflorescence is said to be *centrifugal*. When the outermost flowers expand first, the inflorescence is *centripetal*, as is the case in catkins, spikes, and racemes, in which the flowers nearest the base are the first to expand, and those nearest the apex the last. These modes of inflorescence are very characteristic of different plants, of genera, and of orders.

**CENTRIFUGAL FORCE.** See **CENTRAL FORCES**.

**CENTRIPETAL FORCE.** See **CENTRAL FORCES**.

**CEPHAE'LIS.** See *IPHOACUANHA*.

**CEPHALA'SPIS**, a genus of fossil Ganoid fishes, of which six species have been described, two belonging to the Upper Silurian, and four to the Devonian measures. The head was protected by a large ganoid plate, sculptured externally with circular radiating markings. Agassiz gave the name C. (buckler-headed) from this extraordinary covering, which has very much the appearance of, and was formerly supposed to be, the cephalic shield of an *Aesopus*. The body was covered with rhomboidal enamelled scales, and furnished with dorsal and pectoral fins: it terminated in a large heterocercal tail. In a graphic description of this fossil in his *Old Red Sandstone*, Miller thus sketches the general appearance of the animal: 'Has the reader ever seen a saddler's cutting-knife—a tool with a crescent-shaped blade, and the handle fixed transversely in the centre of its concave side? In general outline, the C. resembled this tool; the crescent-shaped blade representing the head, the transverse handle the body.' The endo-skeleton was cartilaginous, retaining the notochord through life. The flexible body, assisted by the large tail and the fins, would give the C. the power of moving rapidly through the water. Being a predaceous fish, it must have been a formidable enemy to its associates in the Palaeozoic seas, for, besides its power of rapid motion, the sharp margin of its shield probably did the work of a vigorously hurled javelin, as in the sword-fish. This genus was originally named

*Asterolepis* (star-scale), from the circular markings on its cephalic shield.

**CEPHALO'NIA**, or **CEFALONIA**, the largest of the seven Ionian Islands (q. v.), is situated at the entrance of the Gulf of Lepanto or Corinth, in lat.  $38^{\circ} 3'$ — $38^{\circ} 30'$  N., and long.  $20^{\circ} 21'$ — $20^{\circ} 49'$  E. It is irregular in shape. Its greatest length is about 30 miles, and its total area 348 square miles. Its surface is mountainous, the soil, for the most part thin, and water very scarce. The inhabitants, however, are industrious and enterprising, and have planted vineyards wherever the grape will grow, and currants and olive-oil are also produced for export. The climate is warm and agreeable. The population in 1870 amounted to 77,382. The numbers who are brought up to the medical profession are remarkable; it is said that there is hardly a town in the Levant which has not a practitioner from Cephalonia. The inhabitants are also much more disposed to engage in foreign trade than their brethren of Corfu or Zante, and own more vessels. The island is subject to frequent, but slight earthquakes. There was formerly a small English garrison kept at Cephalonia. Steamers ply between it and Malta, Patras, and Triest. The language spoken is a Greek dialect. The chief towns are Argostoli (q. v.) and Lixuri.

C. is called by Homer Same or Samos, and during the heroic age was subject to Ulysses, whose residence was in the neighbouring isle of Ithaca (q. v.). Later, C. appears under the name of Cephallenia. It subsequently fell into the hands of the Athenians, Romans, Byzantines, and Venetians, from the last of whom it was several times wrested by the Turks. On the ruin of the Venetian Republic in 1797, it was seized by the French, who were in their turn dislodged by the Russians. In 1809, it came into the possession of England. It was ceded to Greece in 1864.

**CEPHALOPODA** (Gr. head-footed), a class of mollusks, the highest in organisation of that division of the animal kingdom. To this class belong the Nautili, Spirulae, Argonauts, Poulpes, Squids or Calamaries, Cuttle-fish, &c., of the present time, and the Ammonites, Belemnites, &c., of former geological periods. The C. are all marine, and only a few of them are capable of leaving the water, and moving about in search of food on the shore.

The C. receive their name from having organs of prehension and locomotion attached to the head, an arrangement towards which a gradual approach may be traced in the highest gasteropod (q. v.) mollusks. These organs have been variously designated *arms*, *feet*, and *tentacula*. They 'have no true homology' with the limbs of vertebrate animals, but are only analogous to them in respect of the purposes which they serve.—The body of the C. is a bag, formed of the *mantle* (see *MOLLUSCA*), open only at the end to which the head is attached. In some, this bag is almost spherical, and locomotion is accomplished only by the appendages of the head; in others, the body is elongated, and furnished with two fin-like expansions which are the principal instruments of locomotion. In locomotion by the fins, a cephalopod swims like a fish, with the head first, and often very rapidly; in locomotion by the arms, it drags itself along, laying hold of any object within reach by means of suckers, with which the arms are furnished. Some C. are capable also of moving backwards through the water by alternate contractions and expansions of a muscular web which unites the bases of the arms; some appear to depend for a similar power of swimming backwards upon the forcible ejection of water from the cavity which contains the gills.

## CEPHALOPODA.

The head of a cephalopod is roundish, generally furnished with two large and prominent eyes, very similar in structure to those of vertebrate animals. There are also ears, but they consist merely of little cavities, one on each side of the brain, in each of which is suspended a membranous sac containing a small stone. The organs of smell are not very certainly known, but it appears that the C. possess this sense, as well as that of taste, of which the character of the tongue is much more indicative than in many vertebrate animals.—The brain forms a ring around the gullet. The whole nervous system

Cephalopoda *Loligopeia*.

is more complex than in the lower mollusks.—The mouth opens in the midst of the circle of arms. It is furnished with a strong horny beak of two mandibles, moving vertically, not unlike the bill of a parrot, but the upper mandible the shorter of the two.—The digestive apparatus is very complicated. The gullet swells out into a crop, and there is a gizzard as muscular as that of a bird. The intestine, after a few convolutions, terminates in the cavity which contains the gills, at the base of the funnel by which the water is ejected after having supplied air for respiration. This cavity is situated within the mantle or bag, and separated from the other viscera by a membranous partition. Into it the water is freely admitted by means of a slit or valvular opening, being drawn in by muscular action, and again expelled with considerable force through the funnel, which opens at the neck, and with its current all secretions, eggs, and excrements are carried forth. There are only two gills in the greater number of existing C., the only exceptions being the two or three known species of *Nautilus*, which have four gills; and two-gilled C.—the order *Dibranchiata*—are in many respects of higher organisation than the four-gilled—the order *Tetrabranchiata*—which, although containing so few recent, contains a vast number of fossil species. Each gill consists of many membranous plates, fixed to two sides of a stalk.—The heart in the *Tetrabranchiata* consists of a single ventricle only; but besides this *systemic* heart, the *Dibranchiata* have two *branchial* or *respiratory* hearts, contractile reservoirs, one for each gill, by which the blood is forced into these organs.

The 'arms' or 'feet' are very numerous in the *Tetrabranchiata*, not provided with suckers, but hollow, and with long retractile tentacula; in

the *Dibranchiata* they are only eight or ten in number, furnished with suckers (*acetabula*); two of them, when they are ten in number, being much longer than the rest, and differing from them in form. The suckers are very admirably constructed—an adhesive disk of muscular membrane, often having a cartilaginous circlet, capable of most exact application to any object, with an aperture in the centre leading into a cavity, the bottom of which can be retracted like a piston so as to form a vacuum, and render the adhesion of the sucker close and firm, whilst on the muscular action being interrupted or reversed, it immediately lets go its hold. The Poulpe has each of its eight flexible arms crowded with 120 pair of such suckers, and as an animal of this kind exists on some tropical shores, with arms about two feet long, it is not wonderful that it is reckoned dangerous. Still more formidable, however, are the Hook-squids of the South Seas, the two long arms of which have suckers furnished in the centre with a hook to enter into the flesh of any creature of which they may lay hold, and so more effectually to secure their prey.

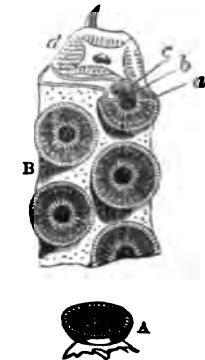

The sexes are distinct in all the cephalopoda. The eggs have a horny covering, and after their extrusion from the parent, become agglutinated into masses of various forms. The young, from the first, very much resemble the mature animals except in size.

All the *Dibranchiata* are provided with a peculiar organ of defence, called an 'ink-bag,' which is wanting in the *Tetrabranchiata*. This ink-bag is filled with a peculiar secretion, capable of being expelled at will to darken the water, and facilitate the escape of the cephalopod.

The *Tetrabranchiata* C. have a chambered shell. See *NAUTILUS*. The *Dibranchiate* C. have no external shell—the shell of the female *Argonaut* (q. v.) being scarcely an exception—but they have an internal shell (cuttle-fish bone, &c.), sometimes merely rudimentary, included between two folds of the mantle, and apparently intended to give support to the soft body of the animal.

The C. are all very voracious, feeding on fish, mollusks, crustaceans, &c. Even a powerful crab is not safe from the attacks of a *Dibranchiate* cephalopod little bigger than itself; the arms, so abundantly provided with suckers, seize it, and trammel every movement, whilst the parrot-like beak is strong enough to break the hard shell. Cuttle-fish and squids are often very troublesome to fishermen, following shoals of fish, and devouring great numbers of them after they are entangled in the net.

Fossil C. exist in all the strata which form the earth's crust. The order *Tetrabranchiata* is almost exclusively a fossil order, being represented by not more than four recent species. With the exception of two genera, *Nautilus* and *Atria*, this order is confined to primary and secondary rocks. The two groups into which it is divided are also characteristic of geological epocha. The *Nautilidae*, with simple or gently undulating septa, and siphuncle central or in the inner margin, belong,

Cephalopoda, suckers of :

A, a single sucker, side view;  
B, a portion of one of the tentacula, with several suckers, front view; a, cartilaginous circlet; b, central cavity; c, piston;  
d, section of the tentacle.

## CEPHALOPTERA—CERBERUS.

to, to the Palæozoic rocks. Including a small group, which, while it has the siphon on the external margin, has yet simple septa, the *Nautilidae* are represented by 145 Silurian, 158 Devonian, and 91 Carboniferous species. The *Ammonitidae* have the siphuncle always on the outer margin of the shell, and the septa with corrugated or lobed margins. This group, with the exception of *Goniatiidae*, a Palæozoic genus, is peculiar to, and co-extensive with, the secondary strata. Of the 930 species that have been described, more than the half belong to the genus *Ammonites* (q. v.).

The order *Dibranchiata* is found first in the Lias, and extends through the more recent strata, receiving its full development in our present seas. Scarcely 90 fossil species have been described, while more than double that number are known as recent animals. See AMMONITES, ARGONAUT, BELEMNITES, CALAMARY, CUTTLE-FISH, GONIATITES, HAMITES, HOOK-SQUID, NAUTILUS, ORTHOCERAS, POULPE, SPIRULA, &c.

**CEPHALOPTERA** (Gr. head-wing), a genus of cartilaginous fishes of the ray family, the type of a sub-family, *Cephalopterida*. The pectoral fins are very much elongated, so as to give great breadth to the fish. The tail is slender and without fin, but armed near its origin with a great spine. The head is terminated in front by a straight line, and on each side of it there projects a membrane (*precephalic fin*) rolled upon itself, and resembling in shape a pointed horn. The name HORNED RAY has therefore sometimes been given to these creatures, of which only one species, *C. Giorna*, has ever been found on the British coasts. It is not uncommon in the Mediterranean, and there acquires a great size: one is mentioned as having been taken off Messina, which weighed 1250 lbs.—more than half a ton. But this is small in comparison with the size of some of the *Cephalopteridae* which occur in tropical seas: one taken at Barbadoes required seven yoke of oxen to draw it. They are very dangerous to swimmers and bathers.

**CEPHEUS**, a constellation of the northern hemisphere, containing, according to the Britannic catalogue, 35 stars. Its principal star is Alderamin, of the third magnitude.

**CEPOLA.** See BANDFISH.

**CERAM**, a long and narrow island of the Asiatic Archipelago, running nearly 200 miles in the parallel of about 3° S., long. 128°–131° E., between Booro on the W., and Papua or New Guinea on the E. With an area of nearly 6000 square miles, it has about 28,000 inhabitants. From east to west it is traversed by mountains rising at some points 8000 feet above the sea. While the high grounds yield abundance of fine timber, the valleys are fertile in tropical productions. The natives, chiefly negroes of the Papuan type, excel in the manufacture of arms. The Dutch claim the sovereignty, and hold several establishments on the coast.

**CERAMBIX**, a Linnean genus of coleopterous insects, included among those which, on account of the length of their antennæ, are usually known as LONG-HORNED BEETLES, and now generally regarded as the type of a tribe or family. To this tribe belongs the Musk Beetle of England (*Callichroma moschata*), remarkable for its strong and agreeable odour, which, however, is rather that of roses than of musk. Some foreign species have the odour of musk in great perfection. *C. hero*, one of the largest European beetles, extremely rare in Britain, deposits its eggs in a hole which it excavates for that purpose in the wood of the oak; and the grub feeds upon the wood, excavating long passages through it.

**CERAMIA'CEAE**, a sub-order of *Algae* (q. v.), also called FLORIDEÆ, and consisting of sea-weeds of a rose or purplish colour, with fronds formed of cells arranged in rows, sometimes in a single row; the sporocarpe containing cells or spores, often in fours (*tetraspores*), with a transparent *perispore*, and enclosed in receptacles of very various form and structure. They are most abundant in the seas of the northern temperate zone. Many of them are very delicate and beautiful. A considerable number furnish agreeable articles of food of a gelatinous nature, as DULSE (q. v.), CARRAGREN (q. v.) or IRISH MOSS, and certain species of PLOCARIA (q. v.), which are much used on the sea-coasts of the East Indies. The edible swallows' nests of the East are supposed to be formed of a sea-weed of this sub-order, a species of *Gelidium*.

**CERA'MIC** (Gr. *keramos*, potter's clay, from *kaio*, to burn, and *era*, earth), a term used to designate the department of plastic art which comprises all objects made of clay, such as vases, cups, bassi-rilievi, cornices, and the like.

**CERA'STES**, or HORNERD VIPER, a genus of serpents of the family *Viperidae*, distinguished by a broad depressed heart-shaped head, the scales of which are similar to those of the back, and particularly remarkable for the development of one of the scales of each eyelid into a spine or horn, often of considerable length. The tail is very

Horned Viper (*Cerastes vulgaris*).

distinct from the body. This genus is exclusively African, and very venomous. The best known species, *C. vulgaris*, the Horned Viper of the north of Africa, was called *C.* by the ancients, the name being derived from the Greek *keras*, a horn. It was correctly described by the traveller Bruce, but his description was for some time regarded with incredulity. Other species of the same genus are *C. nasicornis* of the western coast of Africa, and *C. caudalis* of the Cape of Good Hope.

**CERATE** (Lat. *cera*, wax), a compound of wax with other oily and medicinal substances in such proportions as to have the consistence of an Ointment (q. v.). Simple *C.* is made by melting together equal parts of white wax and olive-oil; they are to be heated together, and carefully stirred into a uniform substance while cooling.

**CERATITES**, a genus of Ammonitidae, peculiar to, and characteristic of, the Trias. They are distinguished from the other members of the family by having the lobes of the sutures serrated, while the intervening curves, directed towards the aperture, are simple. Twenty-six species have been described.

**CERBERUS** (Gr. *kerberos*), in Greek mythology, was the name of the many-headed dog—the offspring (according to Hesiod) of Typhon and Echidna—who guarded the portal of the infernal regions. Later writers describe *C.* as only three-headed, with the tail and mane composed of serpents, though the poets sometimes encumber him with a hundred heads.—A northern constellation,

## CERCARIA—CEREA.

near the hand of Hercules, was named Cerberus, by Hevelius.

**CERCARIA**, a name formerly given to a supposed genus of Entozoa, at first, from their minute size, mistaken for Infusoria, but now known to be the young of Trematode Worms. In the form to which the name C. was given, these creatures consist of an oval body with a thread-like tail; and swim about with great activity in water, but exhibit a strong instinctive propensity to penetrate into the soft bodies of insect larva, which they do by means of a spine-like weapon projecting from

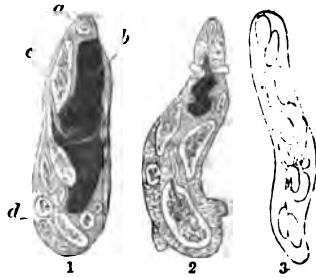

species—in the Parisian menagerie, was remarkable not only for the cunning and adroitness with which it searched and rifled the pockets of visitors, but also for the readiness with which it applied a key to the opening of a lock, untied knots, undid the rings of a chain, and performed other similar feats.

**CERDO'CYON** (Gr. cunning-dog), a genus of Canidae, apparently intermediate between true dogs and foxes, natives of South America. They are sometimes called Aguara Foxes. Their aspect is thoroughly vulpine, as are also their manners. Some of them add to the dispositions of ordinary foxes a singular propensity to steal and secrete brilliant or gaudy objects. A Brazilian species has been known to carry pocket-handkerchiefs into the woods. Some are natives of the coldest parts of South America, and have a rich fur.

**CERE.** See BILL.

**CEREA**, a town of North Italy, about 19 miles south-south-east of Verona. It is a straggling place, with the remains of an old castle. Pop. 5930. The Austrians defeated the French here in 1798.

**CEREA'LIA**, or **CERÉAL GRASSES**, so named from Ceres (q. v.), are the plants which produce grain or corn; in other words, all the species of grass (*Gramineæ*) cultivated for the sake of their seed as an article of food. They are also called **CORN-PLANTS** or **BREAD-PLANTS**. They do not belong to any particular tribes of the great order of grasses, but differ from each other botanically, perhaps as much as any plants within the limits of that order. The seeds of the grasses in general being indeed farinaceous and wholesome, the employment of particular species as bread-plants seems to have been determined chiefly by the superior size of the seed, or by the facility of procuring it in sufficient quantity, and of freeing it from its unedible envelopes. Some of the grains, as wheat and barley, are produced in ears or close-set spikes; some, as a few of those called millet, in spike-like panicles; others, as oats and rice, in very loose panicles. The form and size of the grains vary not a little, some being roundish, and some elongated; maize is the largest; many of the millets are very small. The plants themselves vary in size almost as much as their seeds, the millets being the smallest, and maize the largest of ordinary corn-plants.—Buckwheat and Spurry are sometimes ranked with the C., but incorrectly, if the term is regarded as having any botanical limits, for they are not grasses; but their seeds are used in the same way. The Quince of South America, and the Kiery (*Averrhoëus*) of India, with other plants of different orders, might be added to the list on the same account; even the Lotus of the Nile, the *Victoria regia*, and other species of water-lilies might thus be reckoned as cereal plants. The most extensively cultivated grains are Wheat (*Triticum*), Barley (*Hordeum*), Rye (*Secale*), Oats (*Avena*), Rice (*Oryza*), Maize or Indian Corn (*Zea*), different kinds of Millet (*Setaria*, *Panicum*, *Paspalum*, *Pennisetum*, and *Panicaria*), and Durra or Guinea Corn (*Sorghum* or *Andropogon*). These have all been cultivated from time immemorial, and there is great uncertainty as to the number of species to which the many existing varieties belong; their original forms and native countries cannot confidently be determined. Barley, oats, and rye are the grains of the coldest regions, the cultivation of the two former extending even within the arctic circle. Wheat is next to these, and in the warmer regions of the temperate zone its cultivation is associated with that of maize and rice, which are extensively cultivated within the tropics. The millets belong to warm climates, and durra is tropical or sub-tropical. Rice is the food of a greater number of the human race than any other kind of grain.

Cercaria Sac:

1. A sac two lines long; a, oral cavity; b, alimentary canal; c, a cercaria developed within the sac; d, sporulae not yet developed into cercariae.
2. The sac of a different species.
3. Another species, more simple in form and structure.

their head. The tail, as no longer needed, is now left behind, the closing of the wound through which the C. enters apparently nipping it off. Within the body which it enters, the C. loses also its spine, becomes encysted, and awaits its passive migration into an animal of higher kind, there to become a trematode worm. When it does not succeed in finding, in due time, a larva into which to enter, the C. gathers itself up into a ball; emits a mucous secretion, which soon hardens; and incessantly turning round within this mucous mass, becomes invested with a sort of shell, in which form it is not unlikely to be swallowed by some vertebrate animal. The C. is not the immediate offspring of a parent like itself. It is generated in a curious little animated sac (see figure, taken from Von Siebold's work on Tape and Cystic Worms), which is to be found buried among the organs of fresh-water mollusks, and within which this development of young takes place by gemmation. See GENERATIONS, ALTERNATION OF.

**CERCOCHELÉE**, or **REOERCELÉE**, in Heraldry, is a cross circling, or curling at the ends, like a ram's horn.

**CIFRCIS.** See JUDAS' TRUNK.

**CERCOCEBUS** (Gr. tail-ape), a genus of monkeys, natives of Asia and Africa, included by some naturalists in the large genus *Cercopithecus*. These monkeys have large cheek-pouches, large callosities, and long tails. The species commonly called MANGABEYS, or WHITE EYED MONKEYS, are commonly referred to this genus, besides the CALLITHRIX, or GREEN MONKEY, and the MALBROUK, or DOG-TAILED BABOON.

**CERCOPIP'TH'CUS** (Gr. tail-ape), a genus of monkeys, containing a large number of species, natives of Asia and Africa, but chiefly of Africa. They are called Guenons by French naturalists, but they have no common English name more distinctive than Monkey. They have cheek-pouches and callosities, and a long but not prehensile tail. A *Mowa*, or VARIED MONKEY (*C. Mowa*)—an African

## CEREBELLUM.—CEREBRUM.

Maize has the greatest range of temperature.—Besides these, other grasses are cultivated to some extent, in different parts of the world, for the grain they yield: a species of *Eleusine* (Mand) in India, and another (*Tocusso*) in Abyssinia; a species of *Poa* (Teff) in Abyssinia, and a species of *Coi's* (Job's Tears) in India. Canary Grass (*Phalaris*) may also be named. Canadian Rice (*Zizania*) is used as a grain, but is scarcely cultivated, and the same remark applies to the Manna Grass (*Glyceria*) of the north of Europe, to some species of Bamboo (*Bambusa*), and to the Sea Lyme Grass (*Elymus*), which affords an esteemed article of food, in small quantity, to the inhabitants of Iceland.

Of all the C., wheat is by common consent admitted to be that of which the grain is best fitted for the making of bread, although others are to some extent employed for this purpose. But some, as rice and maize, are scarcely suited for it, and other methods are chiefly employed of preparing them for food. All the grains are also used to produce some kind of fermented liquor or beer, and spirituous liquors are obtained from them by distillation.

**CEREBELLUM.** See **CEREBRUM**.

**CEREBRINE**, or **CEREBRIC ACID**, is an organic acid of very complex composition, found in the liver, blood, and nerves, but especially the brain of animals.

**CEREBRO-SPINAL FLUID.** There is an interval, termed the *Sub-arachnoid Space*, lying between the two innermost of the membranes of the brain and spinal cord—viz., the arachnoid and the pia mater. This space, which is narrow on the surface of the cerebral hemispheres, but is comparatively wide at the base of the brain between the two middle lobes of the cerebrum, and, posteriorly, between the hemispheres of the cerebellum and the medulla oblongata, is occupied by the C. F., which fills up the interval between the arachnoid and pia mater, and keeps the opposed surfaces of the former membrane (which is a closed serous sac) in contact. The C. F. is a clear, limpid, slightly albuminous fluid, having a saltish taste, and a faintly alkaline reaction, and not containing more than 1.5 per cent. of solid matter. It varies in quantity from two to ten ounces, and is said to be most abundant in aged persons. Its chief use is to afford mechanical protection to the nervous centres, and to prevent the effects of external shocks or concussions.

**CEREBRUM, CEREBELLUM.** Cerebrum (Lat. the brain) is sometimes applied to the whole contents of the cranium or skull; but more usually it denotes the upper portion, while the under and posterior portion is called the **CEREBELLUM**, or little brain. In this article we shall briefly notice the chief results which have as yet been obtained regarding the uses of the various parts of the mass, referring to the article **BRAIN** for the necessary anatomical details.

The *crura cerebri* appear as the principal conductors of impressions to and from the cerebrum. When one is divided, the animal moves round and round, from the injured towards the sound side, as if from a partial paralysis of the latter side. The effect may be referred to the interruption of the voluntary impulses from the C., for although the cerebellum seems to have the office of combining the muscles, whose co-operation is necessary for each action, the effort of the will must proceed from the cerebrum.

The *corpora quadrigemina* are, as stated in the article **BRAIN**, 'analogues of the optic ganglia of the lower animals.' Their removal wholly destroys the power of seeing, and diseases by which they are seriously affected are usually accompanied with

blindness. Disease or destruction of one *corpus quadrigeminum* produces blindness of the opposite eye. Probably their connection with vision is not their only function.

The *optic thalami* probably participate slightly in the visual function of the *corpora quadrigemina*; but we have no definite evidence on this point. They are intimately connected with the power of movement. Destruction of one of them causes rotation of the animal, similarly to division of one of the *crura cerebri*. Longet has shewn, that after removing all the cerebral hemispheres and the *corpora striata*, the animal can still stand and walk, but that on removing one of the *optic thalami*, it falls down paralysed on the opposite side, or commences rotatory motion.

The function of the *corpora striata* is very uncertain; they have probably some connection with sensation and volition, the precise nature of which is at present unknown.

The parts hitherto considered—including the cerebellum—appear to comprise the apparatus (1.) For the direction and government of all the unfeit and involuntary movements of the parts which they supply; (2.) For the perception of sensations; and (3.) For the direction of such instinctive and habitual movements as do not require the exercise of any reasoning or intellectual act. They cannot be regarded as organs of the higher faculties of the mind.

The functions of the *cerebral hemispheres* are, in the words of Dr Kirkes (*Handbook of Physiology*), those of organs by which the mind, 1st, perceives those clear and more impressive sensations which it can retain and judge according to; 2d, performs these acts of will, each of which requires a deliberate, however quick, determination; 3d, retains impressions of sensible things, and reproduces them in subjective sensations and ideas; 4th, manifests itself in its higher and peculiarly human emotions and feelings, and in its faculties of judgment, understanding, memory, reflection, induction, and imagination, and others of the like class.

'The evidences that the cerebral hemispheres are, in the sense and degree indicated above, the organs of the mind, are chiefly these: 1. That any severe injury of them, such as a general concussion, or sudden pressure by apoplexy, may instantly deprive a man of all power of manifesting externally any mental faculty; 2. That in the same general proportion as the higher mental faculties are developed in the vertebrate animals, and in man at different ages, the more is the size of the cerebral hemispheres developed in comparison with the rest of the cerebro-spinal system; 3. That no other part of the nervous system bears a corresponding proportion to the development of the mental faculties; 4. That congenital and other morbid defects of the cerebral hemispheres are, in general, accompanied with corresponding deficiency in the range or power of the intellectual faculties and the higher instincts.' See **MIND, THE HUMAN**.

**Cerebellum.**—The functions of this organ have been made the subject of much discussion and investigation. It is itself insensible to irritation, and has been cut away in various animals (by Longet and other French physiologists), without eliciting signs of pain; moreover its removal or disorganisation by disease is generally unaccompanied with loss or disorder of sensibility, animals from whom it has been removed being apparently able to smell, see, hear, and feel, as perfectly as before. Flourens seems by his vivisections to have arrived at the correct view regarding the functions of this organ, and his results have been fully confirmed by Longet and others. He extirpated the C. in birds by successive layers. Feebleness and want of harmony

of the movements resulted from the removal of the superficial layers; when he reached the middle layers, the animals became restless; their movements were violent and irregular; but they were not convulsed, and their sight and hearing were perfect. By the time that the organ was entirely removed, the animals had completely lost the power of flying, walking, standing, and preserving their equilibrium. When a pigeon in this state was laid upon its back, it could not recover its former position; but fluttered its wings, and saw and tried to avoid a threatened blow. Hence volition, sensation, and memory were not lost, but merely the faculty of combining the actions of the muscles. From a large series of experiments of this kind, subsequently made on all classes of animals, Flourens infers that the C. belongs neither to the sensitive nor to the intellectual apparatus; and that it is not the source of voluntary movements, although it belongs to the motor apparatus; but that it is the organ for the co-ordination of the voluntary movements, or for the excitement of the combined and harmonious action of the muscles.

This view is confirmed by the phenomena observed in certain cases of disease, and to a certain extent by comparative anatomy, for to each of the four classes of vertebrates—if we reckon amphibia and reptiles as a single class—the species whose natural movements require the most rapid and exact combinations of muscular actions are those in which the C. is most developed in proportion to the spinal cord; and if we compare different species of the same class, we usually find the development of the C. to correspond very closely with the perfection and variety of the muscular movements. For example, in the frog the movements are exceedingly simple in character, consisting of little else than flexion and extension of the posterior limbs; and the C. of this animal is extremely small compared with the rest of the brain, being merely a thin narrow band of nervous matter. In the common sea-turtles, the movements of the body are of a more varied character, and the motions of the head and neck are more extensive; and here we have a much more highly developed cerebellum. In the alligator, again, a reptile whose motions closely resemble those of quadrupeds, the C. is still more fully developed.

The influence of each half of the C. is directed to the muscles of the opposite side of the body, and for the right ordering of the movements, the actions of its two halves must be mutually balanced and adjusted; for if the nervous structures uniting one of the halves of the C. with the medulla oblongata and spinal cord be divided, strangely disordered movements occur, the animal falling down on the side opposite to that which has been injured, and continually rotating round the long axis of its body, sometimes for several days, at the rate of fifty or sixty times in a minute. Similar movements have been observed in men in whom one of the crura of the C. has been diseased.

Phrenologists are of opinion, in accordance with the view originally propounded by Gall, that the C. is the seat of the sexual impulse and instincts; but this view has been long abandoned by almost all physiologists, for the reason that it has not been found to be sufficiently supported by anatomical and experimental facts, many of which are indeed directly opposed to it.

Our limited space compels us to leave altogether untouched many most interesting topics in Cerebral Physiology, as, for instance, the duality of the brain, the plurality of the cerebral organs, &c. The reader who wishes for further information, is referred to Kirkes's *Physiology* (from which we have freely

quoted), Carpenter's *Human Physiology*, Noble *On the Brain*, Holland's *Chapters on Mental Physiology*, and Brodie's *Psychological Inquiries*.

CEREMONY (Fr. cérémonie; Lat. ceremonia, a sacred rite). Almost any act, when performed in a regular, orderly, and formal manner, and when viewed, not with reference to its object, but the mode of its performance, becomes a C.; and the more entirely the attention of the performers is withdrawn from the object of the act, and fixed upon the manner of its performance, the more *ceremonious* does it become. The purely formal character of C. is thus illustrated by Hooker: 'The name ceremony,' he says, 'we do not use in so large a meaning as to bring sacraments within the compass and reach thereof, although things belonging to the outward form and seemly administration of them are contained in that name.' The remark is applicable to the most trivial ceremonies of social life and of state pageantry, as well as to the most sacred rites of religion, for a C. which is its own object would scarcely be entitled to be regarded even as a ceremony. The most empty display has always the ulterior object of imposing on somebody.

Ceremonies may be divided into four classes: 1. Religious ceremonies; 2. Social ceremonies; 3. State ceremonies; 4. International ceremonies.

Religious and state ceremonies will be treated of respectively under their various denominations; see, for the first, RITES, LITURGY, MASS, PROCESSIONS, &c.; and for the second, CORONATION, COURT, COURT, PRESENTATION AT, PARLIAMENT, &c. Social C. will in a great measure fall under the heads, ETIQUETTE, PRECEDENCY, COURTESY, FORMS OF ADDRESS, &c.; and international C. under DIPLOMACY, CONSUL, AMBASSADOR, &c.

CEREOPSIS (Gr. wax-face), a genus of birds of the family *Anatidae*, to which the New Holland goose (*C. Nova Hollandiae*) belongs. This bird has been known since the southern shores of that country were first visited by navigators. There, and on the adjacent islands, it is found in great abundance; and the earlier navigators easily supplied themselves with fresh provisions by knocking them down with sticks, so little were they acquainted with the danger to be apprehended from man. The cere is remarkably large, whence the name.

CERÉS, among the Greeks named *Demeter*, daughter of *Chronos* (Saturn), by *Rhea* (Ops), sister of Jupiter, Neptune, Juno, &c. She had the misfortune, along with her other brothers and sister, to be devoured by her father, who, however, vomited her forth again after taking the emetic which *Metis* gave him. By her brother Jupiter she became the mother of *Persephone* or *Proserpina* (q. v.). The chief myth relating to C. tells how her daughter *Proserpina* was stolen by *Pluto*, and how the mother wandered far in quest of the maiden. After travelling in human form nine days, and everywhere distributing her gifts to mankind, she excited the pity of Jupiter, by whom Mercury was despatched to bring back *Proserpina* from the infernal world, but on the condition that she must spend there a third part (or, as others say, one-half) of every year. The myth of C. was symbolical of the growth of grain; some consider that this is intimated in the name *Demeter*, which is thought to be equivalent to *ge meter*, 'Mother Earth.' The relations of the worship of C. with agriculture, social order, &c., were expressed in her two great festivals—the *Eleusinia* (q. v.) and *Thesmophoria* (q. v.). C. was especially worshipped in Crete, Delos, Sicily, Asia Minor, Arcadia, Argolis, and Attica. Bulls, cows, pigs, honey-cakes, and fruits

were offered to her. Among the Romans, her festivals were styled *CERALLA*; and of these, the most interesting was the feast celebrated by the rural population shortly before harvest, when the country people, dressed in white, and crowned with oak-leaves, danced and sang harvest-songs in honour of the goddess. The feast in April lasted several days, and was celebrated by games of the circus. C. was represented, most commonly, in a chariot drawn by dragons, having her head crowned with a garland of corn-ears, and holding a torch, a basket, or a poppy in her hand.

**CERES**, one of the Planetoids (q. v.), and the first of them that was discovered. It was first seen by Piazzi at Palermo, January 1, 1801. He continued to observe its motion till the 13th of February, when illness obliged him to discontinue his observations, which, however, sufficed to enable astronomers approximately to calculate its orbit. It was nearly a year after before it again became visible, owing to its approach to the sun. C.'s magnitude is less than that of the moon; and it looks like a star between the seventh and eighth magnitudes.

**CEREUS**, a genus of plants of the natural order *Cactea* (q. v.), containing about 100 known species, among which are some of the most splendid flowers of that order. One of these is *C. speciosissimus*, now one of the most common green-house plants in Britain, and sometimes cultivated even in windows. Its large flowers are of a fine scarlet colour, the inner petals with a violet tinge: they spring singly from the younger branches. The fruit, when well ripened, is of a delicious flavour. The plant is a native of Mexico.

**CERIGNOLA**, a town of Italy, in the province of Capitanata, 23 miles south-east of Foggia. It is divided into two parts—the old and new town, in the former of which a portion of the ancient walls still remain—and is celebrated for the decisive victory obtained over the French by the Spaniards in 1503, and which established the supremacy of Spain in Naples. C. has manufactures of linen, and a trade in cotton and fruits. Pop. 17,300.

**CERIGO**, one of the smaller of the seven Ionian Islands, was anciently called Cytherea; is situated in the Mediterranean, and is separated from the coast of Morea by a narrow strait; lat. 36° 28' N., long. 23° E. It has an area of 107 square miles, with a population in 1864 of 14,454. With the exception of a few tracts of land, it is a very barren, dry, and mountainous island. In some parts, however, corn, wine, and olive-oil are raised. There are two great caverns in the island—one in the sea-cliff at the termination of the wild glen of Milopotamos; the other, known by the name of the Cavern of St Sophia, from a small chapel at its mouth dedicated to this saint, is situated at about one and a half hour's ride from Capeali (q. v.), the capital of the island. The former cavern is said to be three miles in length, and so low that it is necessary to creep, in many places, on hands and knees to explore it. The latter—that of St Sophia—is a very remarkable one, and possesses singular beauty; it abounds in enormous stalactites of various shapes and great beauty. In ancient times, C. was sacred to Venus, being, according to the old mythology, the island that received this goddess when she arose from the sea.

**CERINTHUS** (abusively named *MERINTHUS*, i. e., a halter), a heretic who lived at the close of the apostolic age, but of whom we have nothing better than uncertain and confused accounts. It is said that he was a Jew by birth, and studied philosophy in Alexandria. From Egypt he passed

into Asia Minor, and lived in Ephesus contemporaneously (according to the belief of the church) with the aged apostle John. Tradition tells us that John held the heretic in such detestation, that, on a certain occasion, when he encountered C. in the baths of Ephesus, he immediately left the place, saying to those about him: 'Let us flee home, lest the bath should fall while Cerinthus is within.' It was believed in the ancient church, that the Gospel by St John was written in opposition to the tenets of C.; and the Roman presbyter Caius (about the close of the 2d c.) supposed that C. had revenged himself by falsely ascribing the authorship of the Apocalypse to St John—it being in reality his own work! The Fathers contradict one another in their accounts of Cerinthus. Some describe him as a complete Gnostic, in which case he would be the earliest recorded teacher of that sect; others say that he held coarse and sensual millenarian views, making the *millennium* (q. v.), with the licentious fancy of an Arab, consist chiefly in 'nuptial delights'; and that he believed the Jewish ceremonial law to be in part binding upon Christians. There can be no doubt that C. made use of the Jewish law at least as a symbol for his Gnostic doctrines, and also employed millenarian terms in a symbolical manner; a very natural thing for him to do, on the hypothesis which Neander and others have suggested—that Gnosticism originated, not among the minds which had received a true Hellenic culture, but among the Judaizing sects, whose theosophy was a jumble of the spiritual and the material. C. being the oldest teacher of Judaico-Gnostic principles, there would naturally be a greater incongruity and want of harmony in his language and ideas than characterised Gnosticism at a later period of its development; and subsequent ecclesiastical writers, destitute as all of them were of precise historical knowledge and sound principles of criticism, could hardly avoid misunderstanding a system which is not consistent throughout, but bears evident marks of being formed in a transition epoch.—Paulus, *Historia Cerinthi* (Jena, 1799); Neander, *Kirchengeschichte*, vol. i., part 2.

**CERITE**, or O'CHRÓITE, is the *Silicate of Cerium*. It is found as a mineral in gneiss, at Westmanland, Redderhyttan, and Bastnäs. It contains in 100 parts—silica, 16; peroxide of cerium, 26·55; oxide of lanthanum, 33·38; carbonic acid, 4·62; alumina, 1·68; peroxide of iron, 3·53; lime, 3·56; oxide of manganese, 0·27; and water, 9·1. It occurs in granular pieces of a clove-brown, cherry-red, or gray colour, with a white streak, a splintery fracture, an adamantine lustre, and is translucent at the edges.

**CERITHIUM**, a genus and the type of a family, *Cerithiidae*, of gasteropodous mollusca of the order *Pectinibranchiata* of Cuvier. The shell is spiral, elongated, and many-whirled, with an oval oblique aperture which has a short canal in front. The species of this family are numerous, most of them marine, but many inhabiting estuaries and brackish rather than salt water; some are found in lakes and rivers. A few belong to temperate climates, but most of them are tropical, and in mangrove swamps they particularly abound. The fossil species are very numerous, almost all limited to the tertiary formations. See *BAGAZOR BEADS*.

**CERIUM** is a rare metal found native in Cerite (q. v.) and a few other minerals. It is a white metal, has not been obtained in any quantity, is not therefore employed in any manufacture, and forms two oxides and a numerous class of salts.

**CEROPLASTIC** (Lat. *cera*, wax), the art of modelling in wax. See *WAX-WORK*.

species of encaustic painting upon horn or ivory, the lines of the design being burned in with the cestrum or burning needle, and wax introduced in the furrows thus made.

CERROXYLON. See WAX PALM.

CERRETO, a town of South Italy, in the province of Caserta, situated on a slope of the Apennines, about 22 miles north-east of Capua. It is a well-built town, with a cathedral, and manufactures of coarse cloth. The district produces good wine. Pop. 6469.

CFREO GOR'DA, the name of several localities of Spanish America.—1. A plateau in Mexico, the most easterly on the route from Vera Cruz to the capital. Here, on 18th April 1847, the Americans totally defeated the Mexicans.—2. A city of Peru, the capital of the province of Pasco, in the department of Junin. It is in the vicinity of the richest silver-mines in the republic; and standing at an elevation of 14,100 feet, it has, all the year round, the temperature of an English winter. The estimates of the population range from 7000 to 16,000. C. G. in 140 miles to the north-east of Lima.

CHARTALDO, a market town of Central Italy, is picturesquely situated on the Elsa, about 18 miles south-west of Florence. It is noteworthy as the residence of Boccaccio, as well as the scene of his death. His house, surmounted with a tower, is still standing, and contains the articles of furniture belonging to the poet's time, and a fresco painting of him by Benvenuto Cellini. Pop. 6562.

CERTH'ADÆ, a family of birds, generally placed in the great order *Insestoræ* or *Passerine*, and tribe *Tenuirostres*, although some naturalists have ranked them in the order *Scansores*. They mostly live on the trunks and branches of trees, feeding on insects which they find in the crevices of the bark; and many of them aid themselves by their stiff tail-feathers in retaining their position as they search for their food on the perpendicular stem. Their claws are long and sharp; the hind-toe is also elongated, so that they can take firm hold of the bark of a small branch; and many of them can pass round a horizontal branch, clinging to its under-surface with their backs to the ground. The bill of many is slender and curved; others, however, have a comparatively short and straight bill. The tongue is cartilaginous at the extremity, and so fitted to aid in seizing insect prey. The plumage is usually dull and uniform; but the birds are lively and active in their habits. The species are numerous and widely diffused; they are divided into a number of genera. All of them are small birds. The Creepers (q. v.), forming the genus *Certhia*, are regarded as exhibiting the type of the family. Wrens and Nut-hatches, although referred to it, depart very considerably from this type. Many small tropical and subtropical birds, which live by sucking honey from flowers, formerly referred to this family, are now separated from it.

CERTIFICATE, a written testimony to the truth of a certain fact or facts. The law of England recognizes certificates for various purposes. 1. Annual C. of attorneys. See ATTORNEY. 2. C. of appointment of the creditors' assignees to a bankrupt's estate and effects. 3. C. of conformity of a bankrupt. 4. C. of counsel, to enable a pauper to litigate in *forsa pauperis*. 5. C. of the judges of the superior common-law courts at Westminster, which are of various kinds and for various purposes. 6. C. of registry of a ship; which is a copy of what is entered in the register of the ship in the books of the Custom-house. This C. is granted by the collector, comptroller, or principal officer of

730

to the captain as a voucher of the character and privileges of the vessel as a British ship.

CERTIFICATION, in the law of Scotland, signifies the judicial assurance given to a party of the course to be followed by the judge in case he disobeys the will of a summons, or other writ or order of the court. Reiterated contumacy on the part of the defendant was at one time punished with confiscation of his property (1449, c. 29), but now C. amounts to nothing beyond an intimation that if he fails to appear in the usual manner, the judge will decern, or pronounce judgment against him. The most important C. is in the process of Reduction-improbation (q. v.). In this action, two terms are allowed for the production of the deed called for, and sought to be reduced. Thereafter, an additional ten days are given; but should production not be satisfied on their expiry, decree of C. will be pronounced, and this decree has the effect of declaring the deed to be forged and fabricated. Such a decree, even though pronounced in absence, can hardly be recalled. In simple reduction (see REDUCTION), the C. is only to the effect that the deed shall be void and null, till produced.

CERTIFIED COPY. See EVIDENCE.

CERTIORARI (Lat. to be certiorated, or more fully and accurately informed of), in English law, is an original writ issuing, in civil cases, out of the common-law jurisdiction of the Court of Chancery, and in criminal, from the criminal side of the Court of Queen's Bench. This writ, which runs in the Queen's name, is addressed to judges or officers of an inferior court, commanding them to certify or to return the records of a cause depending before them, in order that the party may obtain more sure and speedy justice, from such justices as shall be assigned to determine the cause. A writ of C. may be granted at the instance either of the prosecutor or defender; but, to prevent its being used as an instrument of oppression by the one party against the other, it is provided (5 and 6 Will. IV. c. 33, and 16 and 17 Vict. c. 30) that either party, before applying for it, must obtain the leave of the court, and enter into recognizances.

The writ passes on a *Bill of C.*, which states the proceedings in the inferior court, so far as they have gone; sets forth the alleged ground of incompetency, by suggesting that the cause is beyond the jurisdiction of the court, that the defendant or witnesses live beyond it, or the like reason why substantial justice cannot be done; and then prays the writ to certify and remove the cause into the superior court. When the bill is filed, the writ of C. is obtained on motion.

CERTO'SA DI PAVIA, LA, one of the most celebrated monasteries in the world, is situated in the neighbourhood of Pavia, and was founded, 1326, by Giovanni Galeazzo Visconti, first Duke of Milan, to appease his conscience for the murder of his uncle. The church is a splendid structure in the form of a Latin cross, the ground-plan being 249 feet long by 173 feet broad. It has altogether 12 chapels, 7 in the whole length of the church, and 5 in the transept, some of which are decorated with fine frescoes and paintings. The richly sculptured façade, designed by Ambrogio da Fossano, named Borgognone, was commenced in 1473. The building is made up of various styles, but the pointed prevails in the interior, which is decorated with frescoes, paintings, &c., by Dan Crespi, Andrea Solari, Campi, and Ambrogio Fossano, and contains a gorgeous high-altar, the mausoleum of the founder, and several monuments.

**CERUMEN.** This term is applied to yellow waxy matter which is secreted by certain glands lying in the external auditory canal, or the passage that leads from the external opening of the ear to the membrane of the tympanum. Its main use, doubtless, is to lubricate this passage. It possesses a peculiarly bitter taste, and some physiologists have believed that in consequence of this property it prevents insects from entering the auditory canal. It is popularly known as ear-wax.

**CERUSE,** or **WHITE-LEAD**, the basis of white oil-paint, is a *carbonate of lead*. It has several other names—krema, Nottingham white, flake-white, &c. Like all other preparations of lead, C. is liable to be acted upon by exhalations from sewers, or by anything which contains sulphuretted hydrogen, in which case it is changed to a dull and leaden hue. Neither will it bear to be mixed with any pigment containing sulphur, such as vermillion. It is supposed that the white oxide of zinc might be substituted for C. as a white pigment with advantage.

**CERVANTÉS SAAVEDRA**, MIGUEL DE, one of the greatest imaginative writers of Spain, was born of an old Galician family, at Alcalá de Henares, October 9, 1547. He studied at Salamanca, and afterwards at Madrid, where he was placed under the care of a learned theologian, Juan López de Hoyos, who was then professor of belles-lettres in the university. But his natural love of poetry led him to spend most of his time in writing elegies, ballads, sonnets, and a pastoral romance entitled *Filena*. When 22 years old, C. served for some time as valet-de-chambre to Cardinal Giulio Aquaviva of Rome. In 1570 he served as a volunteer under the command of the papal admiral, Marco Antonio Colonna, and fought gallantly against the Turks. At the battle of Lepanto, he was maimed for life by a gunshot wound in the left hand. He afterwards took part in various campaigns. Captured by an Algerine squadron, he was made a slave, but was ransomed in 1580, after a four years' captivity. On his return to Spain, he rejoined his regiment in the army sent by Philip II. to support his claims in Portugal, and distinguished himself in the expedition to the Azores. In 1584, he returned to Spain, and retired into private life, to devote his attention to literature. Soon after his publication of the pastoral romance, *Galatea* (1584), he married, commenced writing for the stage, and produced, in the course of a few years, as many as thirty dramatic pieces, of which the tragedy *Nunancia* is the most remarkable. During the years 1588–1599 he lived in straitened circumstances in Seville. In 1605 he once more appeared as an author, and now in a sphere exactly suited to his genius. In his immortal work, *Don Quixote*, C. intended to put an end to that taste for extravagant romances of chivalry which had so long prevailed. The first part of this great satirical work appeared in Madrid, and was received at first coolly, but soon afterwards with loud applause, which, at a later period, was echoed from all parts of educated Europe. *Don Quixote*, though written with a satirical purpose, is throughout pervaded by the true spirit of poetry. With that universality which belongs to the highest genius, C. connected a universal human interest with descriptions of local and temporary characteristics. He did not intend by his *Don Quixote* to burlesque the old Spanish knight-errantry, for, as Mr Ford remarks (see *Handbook of Spain*, part i., p. 238), ‘the thing had expired a century before his birth,’ but to put an end to the absurd and affected romances which it was then the fashion to read, and which were believed to be

true pictures of chivalry. He had also, it is quite clear, another object in view—viz., to shew that the deeper and truer and more guileless a nature is, the more will it become the jest and butt of real life; but he likewise teaches us that the pure heart and the high soul obtain a triumph which misfortunes and blunders cannot tarnish; for the knight, always ‘disinterested, generous, elevated, and beneficent,’ though ‘the sweet bells of his intellect are jangled and out of tune,’ maintains throughout a firm hold on our affections and esteem. Charles Lamb has truly said, that readers who see nothing more than a burlesque in *Don Quixote*, have but a shallow appreciation of the work.

Though received with enthusiasm, *Don Quixote* brought no pecuniary reward to the author. He was left in the obscurity and poverty in which he had passed so many years, and vainly endeavoured to improve his circumstances. After silence during several years, C. published his twelve *Novelas Exemplares* (Exemplary Tales), 1613; his *Viaje al Parnaso* (Journey to Parnassus), 1614—his next best production to *Don Quixote*; and in the following year he produced eight new dramas, but these were indifferently received. In 1614, a certain Alonso Fernandez de Avellaneda published at Tarragona, in 1614, a so-called continuation of *Don Quixote*, which was made a vehicle of abuse lavished on Cervantes. It appears that C. suffered considerably under these despicable attacks; but he revenged himself in noble style by publishing (1615) the true continuation of *Don Quixote*. Near the close of his career, C. found a patron in the Count of Lemos, who relieved his poverty. During the last few years of his life, he resided in Madrid, where he died, April 23, 1616. No stone marks the spot where his remains were interred. His novel, *The Sorrows of Persiles and Sigismunda*, was posthumously published. In 1835, when the house in which the poet had lived in Madrid was rebuilt, a bust of C. by the sculptor Don Antonio Solá, was placed in the front.

Among the several editions of *Don Quixote*, we may mention the splendid one in 4 vols. (Madrid, 1780); that by Pellicer (5 vols., Madrid, 1798); the fourth published by the Madrid Academy, with an admirable life of C. by Navarrete (5 vols., Madrid, 1819); Diego Clemencín's edition, with the most complete commentary (6 vols., Madrid, 1833–1839); and a good pocket-edition, published at Leipzig (6 vols., 1800–1807). Of the collected works of C., an edition, not containing the comedies, appeared at Madrid (16 vols., 1803–1805); and another, without the *Journey to Parnassus*, was published in the same city (11 vols., 1828). Don Aug. García de Arrieta published a selection from the works of C. (10 vols., Paris, 1826–1832); and a reprint of the collected works is included in Baudry's *Colección de los Mejores Autores Españoles* (Paris, 1840–1841). England has been fertile in translations of C.'s immortal work. The first is that of Thomas Skelton (1612–1620), in addition to which may be mentioned those of Philips, Motteux, Smollett, Durfey, Jarvis, and Wilmot. The two best are those of Skelton and Jarvis.

**CERVERA**, a town of Spain, in the province of Barcelona, 28 miles east of the city of Lerida. It is situated on an eminence, is surrounded by old walls pierced with nine gates, and the west approach is commanded by a castle, which is now in a ruinous condition. The university of Lérida was removed here by Philip V., but it was afterwards transferred to Barcelona. The university building, a massive but unsightly edifice, is still standing. C. has manufactures of linen, woollen, and cotton fabrics. Pop. 5300.

CERVETERE, or CERVETRI (ancient Cere or Agylla), a town of Central Italy, 27 miles west of Rome. Though now a place of some 700 or 800 inhabitants, it was formerly one of the most important cities of Etruria, possessing, it is said, a famous collection of paintings before even Rome was founded. Many Etruscan remains of value have been found here.

CERVIA, a town of Central Italy, situated on the Adriatic, 13 miles south-south-east of Ravenna. It is regularly built, has a cathedral and several convents; and from a marsh in the neighbourhood about 50,000 tons of salt are annually obtained, the salt-works employing a considerable number of the population, which is about 6000.

CE'RVIDÆ AND CE'RVS. See DEER.

CERVIN, MONT (Ger. *Matterhorn*; Ital. *Monte Silvio*), a mountain of the Pennine Alps, about 40 miles east-north-east of Mont Blanc, and between the Valais in Switzerland and the Val d'Aosta in Piedmont. Above an unbroken glacier line of 11,000 feet high, it rises in an inaccessible obelisk of rock, more than 3000 feet higher—and is described by the late Professor Forbes as the most striking natural object he had ever seen. The total elevation of the mountain is 14,836 feet. The Col of Mont C., used as a passage for horses and mules in summer, has an elevation of 10,938 feet.

CERVINARA, a town of Italy, in the province of Principato Ultra, 12 miles north-west of Avellino. It has a convent and several churches, and a trade in the produce of the district. Pop. 6328.

CE'SARI, GIUSEPPE (sometimes called GIUSEPPIANO, or IL CAVALIERE D'ARFINO), an Italian painter, was born at Rome, 1570, and died there in 1640 (or 1642). He was greatly honoured by no less than five popes, and his paintings were always highly popular. His works—in fresco and oil—display lively imagination, gay colouring, and great tact in execution; but are deficient in natural simplicity, correctness of design, symmetry of arrangement, and dignity of style. As he was the most brilliant of the mannerists, he was the chief object of the attacks made by the artistic reformers, Caravaggio, the Caracci, and their followers—who constituted the *naturalisti*—on the conventional or pseudo-idealistic style of painting.

CESARO'TTI, MELCHIORRE, an excellent Italian poet, was born at Padua, 15th May 1730, and died 3d November 1808. He gained a reputation by the vigour and originality of his style, especially in his translation of Macpherson's *Ossian* (2 vols., Padua, 1763). The versification of this work, like that of C.'s free translation of the *Iliad*, under the title of *La Morte di Ettore*, was admired by Alfieri. C. unquestionably threw fresh life into Italian literature, but few in this country will consider his enthusiasm very rational, when it could induce him to think poor Macpherson a better poet than Homer. C.'s best work was his *Saggio sulla Filosofia delle Lingue* (Padua, 1785), written in opposition to the academical pedantry of La Crusca. His prose style is vigorous, but full of innovations, especially Gallicisms.

CESE'NA, a town of Central Italy, about 12 miles south-east of Forlì, on the Emilian Way. It is pleasantly situated on a hill-slope, washed by the Savio. Its principal buildings are the *Palazzo Pubblico*, the Capuchin church, and the library founded by Domenico Malatesta Novello, in 1452, with a rich collection of MSS. There are many monasteries and nunneries, as befits a place that gave birth to two popes—Pius VI and VII. It has some silk factories, with a trade in wine and silk;

and in the vicinity are productive sulphur-mines. Pop. (1872) 35,870.

CESS, probably a corruption for *assess*, from the Ital. *assessare*, to impose a tax. It has long been used in England as synonymous with the more modern noun *assessment*. Camden, in the time of Elizabeth, speaks of every man being 'cessed by the pole, man by man, according to the valuation of their goods and lands.' See LAND-TAX.

CESSIO BONORUM (Lat. cession or surrender of goods), a process which the law of Scotland has borrowed from that of Rome, and which, like many others, is common to it with most of the continental systems. A C. B. may be defined to be an equitable relief from the severity of the earlier laws of imprisonment for debt, granted to a debtor in consideration of a cession of his goods to his creditors. The jurisdiction in cessios formerly belonged exclusively to the Court of Session, but by 6 and 7 Will. IV. c. 56, it was extended to sheriffs. The principal regulations with reference to this process, as present in force, are the following: Any debtor in prison, or who has been in prison, or even against whom a warrant of imprisonment has been issued, may apply for a Cessio Bonorum. In his petition, he sets forth his inability to pay his debts, and his willingness to surrender his estates, and prays for interim protection. This petition must be intimated in the *Gazette*. The bankrupt then lodges with the sheriff-clerk a state of his affairs, subscribed by himself, with all the relative books and papers. On a day appointed for the purpose, he is examined before the sheriff on oath; and if his creditors object to the petition, they are heard, and a proof, if necessary, allowed them. Whatever order the sheriff may pronounce is subject to review by the Court of Session, or a Lord Ordinary in vacation. Cessios originating in the Court of Session are sued out in the form of a summons, by which all the creditors are called as defendants to the action. Any one or more of them may appear; and the pursuer will not be allowed the benefit of the process, till he has satisfied the court that his insolvency has arisen from misfortune, and that his disclosure of the state of his affairs is full and honest. The burden of proving objections to his statements, and to the evidence which he may produce, will be laid on the creditors. If the debtor can find caution (q. v.) to attend all diets when called on, the sheriff or the Court of Session may grant him liberation or protection whilst the process is pending. A decree of C. B. operates as an assignation of the debtor's movable estate in favour of a trustee for behoof of the creditors. These trustees, like those in sequestrations, are now placed under the supervision of the Accountant in Bankruptcy. A C. B. differs from a Sequestration (q. v.) in this, that it confers no power on the bankrupt to insist on his discharge, and affords no protection against the attachment of his subsequent acquisitions by his creditors. The debtor has the privilege of retaining his working tools; but nothing beyond what is necessary for mere aliment will be allowed, even to half-pay officers and clergymen.

CESTIUS, PYRAMID OF, a Roman monument of the Augustan age, situated close to the Porta San Paolo, partly without and partly within the walls of Aurelian. It is known to every English traveller, being in the immediate vicinity of the cemetery where Protestants dying in Rome are buried. The exterior form is perfectly preserved; but of the paintings which formerly decorated the internal walls, only a few traces remain. Several copies of these paintings have been made, of which we may mention those edited by Falconieri, 1661. The

## CESTIUS—CESTOID WORMS.

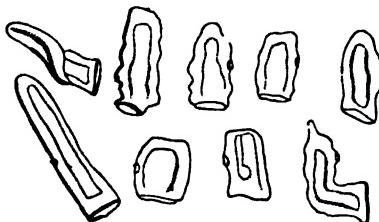

pyramid is 125 feet high, 100 feet in width at the base ; the walls 25 feet thick. It is built of brick and tufa, faced with slabs of Carrara marble, now perfectly black with age, and rests on a base of travertine 3 feet high. The interior contains burial-chambers of considerable extent. The inner walls are covered with hard stucco, and the roof is vaulted. Both the walls and the roof were covered with paintings of female figures. The memory of the Caius Cestius for whom this pyramid was built has perished, but it has been supposed that he was the Cestius whom Cicero—in the oration *pro Flacco*—mentions as a rich man of business, who, having no children, left a large sum of money for the erection of a monument to himself. Two fluted columns of white marble, now standing before the pyramid of C., with their bases and two other bases, were discovered in the excavations of 1663, at the foot of the pyramid. In the cemetery, the remains of several celebrated men have their resting-place, among whom are the poets Keats and Shelley, Wyatt the sculptor, and Bell the anatomist.

**CESTOID WORMS** (Lat. *cestus*, a band or thong), a family of *Entozoa*, or intestinal worms, of the order *Caledintha* (q. v.), consisting of tape-worms and other creatures which resemble them in structure and habits. The number of different kinds of C. W. is great. Their natural history is important in reference to the health of human beings and of the most valuable domesticated animals ; and although the subject is not in all respects an agreeable one, it presents much that is interesting and wonderful. Recent discoveries have given it an entirely new character.

C. W., in their most perfect state, when alone they possess the form from which their name is derived, are in reality compound animals, like many zoophytes and ascidians. They do not, however, like these, subsist by food entering the system through mouths with which the individuals composing it are furnished ; for the joints of a cestoid worm, the individuals composing the system or 'colony,' have no mouth ; nor is there any mouth in what is, on various accounts, quite properly regarded as the head, but nutriment is obtained from the surrounding medium by *endosmose* (q. v.) ; nourishing juices entering everywhere through the skin, as in the spongiolas of the roots of plants, into the cellular tissue or *parenchyma* of which the whole body consists. The head of a cestoid worm is furnished with organs—different in different kinds—by which it affixes itself to the inner surface of the intestine of a vertebrate animal. When first it gets into this situation, the body is very short, and has no joints ; but they soon begin to appear as transverse striae, and gradually increasing in size, become in most of the kinds very distinct, and at last separate from the system in which they were produced, and are carried away out of the intestines of the animal which contained them. This does not take place, however, till they have not only become mature in the development of the sexual organs—the principal organs to be observed in them—but until they are full of what are called eggs, which, indeed, are rather young ones ready for a separate existence, and each enveloped in a sort of protective shell. Each joint of a cestoid worm is androgynous. Whilst the most matured joints are thrown off from the posterior end, new joints are continually formed, as at first, in the part nearest to the head. The number of joints thus formed from a single individual is very great, as will appear when it is considered that tape-worms have been found 20 feet long or upwards, and that these have probably been throwing off joints in large numbers before opportunity has been obtained of measuring them.

As the C. W. have no mouth, so they have no alimentary canal. Some of them, as the true tape-worms, have been supposed to imbibe nourishment by the sucking disks of the head ; but these are more probably mere organs of attachment, and the canals which are seen to arise behind them, apparently belong, not to the digestive, but to the vascular system, and are united by transverse vessels or vascular rings in the head and in each of the segments. The only trace of a nervous system hitherto observed is a single ganglion in the head, which in some is seen to send off nerves to the suckers.

The division into segments remains imperfect in some cestoid worms. Those of the genus *Ligula*—chiefly found in birds and fishes—resemble a long flat ribbon, not even notched along the edge, and containing a mere series of hermaphrodite brood-places. When segmentation is perfect, the segments (*proglottides*), on separating from the parent system

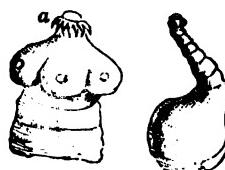

Segments (*Proglottides*) of Common Tape-worm :  
In different States of Expansion and Contraction.  
(From Von Siebold's work on Tape-worms.)

(*strobila*), possess life and a little power of independent motion, creeping away on moist ground, plants, &c. Their period of separate existence, however, is brief ; they burst or decay, and the numerous minute embryos which they contain are ready to commence their career, if in any way transferred into the stomach of an animal of proper kind, which is generally different from that whose intestine their parent inhabited. This may happen by their being swallowed—or even the *proglottis* itself—along with water, grass, &c. Some of the C. W. in this embryo state find their appropriate place in the stomachs of vertebrates, and others in those of invertebrate animals.

The shell being broken or digested, the young cestoid worm is set free. It is extremely unlike the proglottis by which it was generated. It presents the appearance of a vesicle furnished with a few microscopic hooks. It possesses, however, a power of active migration by means of these hooks, and is able to perforate the stomach of the animal which contains it. To this its instinct seems immediately to prompt it, and it is so minute that it passes through the stomach without any serious inconvenience to the animal. It now probably gets into the blood, and is lodged in some of the capillaries, from which it makes its way again by perforation, until it finds a suitable place in some of the tissues or of the serous cavities, in the flesh, or in such organs as the liver or the brain ; and here relinquishing all active migration, it rapidly increases in size, at the same time developing a head, which is in fact that of a cestoid worm, and generally either encysts itself or is encysted—enclosed in a cyst (q. v.)—according to circumstances, or according to its species. Great numbers of such parasites are sometimes present in a single animal, causing disease and even death. Until recently, they were regarded by naturalists as constituting species and genera

quite distinct from the C. W., of which they are really the young; and the name *scolex*, formerly given to one of these supposed genera, has now become a common name for the young of all C. W. in this stage, as *larva* is the common name for the young of insects in their first stage after being hatched from the egg. Those scolices which inhabit vertebrate animals very generally become distended with a watery fluid, and in this state were formerly regarded as *Hydatidæ* (q. v.); little else, indeed, appearing without very careful examination, but a small bag filled with fluid, the scolex head being formed within the bag, although capable of being everted from it, as the finger of a glove which has been drawn in at the end is turned out. Such is the young of the common tape-worm (*Tenia solium*),

Cysticercous Cellulose  
(magnified):

a, the head, much magnified.

scolex accidentally getting into the mouth, and thence into the stomach, is likely to become a formidable inmate of the intestinal canal. It does not appear that this particular species has the power of multiplying in its scolex state, or the circumstances in which it exists in the flesh of the pig may be unfavourable to its so doing, and the prodigious numbers sometimes existing in a single animal have probably all entered by the mouth in the way already described, the contents of a single proglottis or joint of a tape-worm being perhaps sufficient to account for them; but some scolices, as that called *Cesturus cerebralis*, found in the brain of sheep, and the cause of the disease called *staggers*—now known to be the scolex of a *Tenia* of the dog—are proliferous by a sort of pullulation, so that clusters of scolices cover the same parental vesicle. Until, however, the scolex reaches the intestine of an animal suited to it, its propagation is entirely unsexual, and no organs of sex exist; but no sooner is it there, than it begins to develop itself into a cestoid worm, and to produce androgynous joints, fertile of new embryos, as already described. Thus we have in these creatures an instance, in its relations the most important known, of the recently discovered alternation of generations. See GENERATIONS, ALTERNATION OF. The transference of the scolex from its place of growth to that in which it becomes a cestoid worm, usually if not always takes place by the animal which contains it being eaten by that whose intestine is suitable to its perfect development. Each kind of cestoid worm is limited to certain kinds of vertebrate animals, and it has been proved by experiment that if introduced into the stomach of other kinds, the scolices soon die. The only C. W. which infest the human species are *Bothriocephalus* (q. v.) *latum*, and Tape-worms (q. v.). See Von Siebold's interesting work on Tape and Cystic Worms, printed for the Sydenham Society (London, 1857).

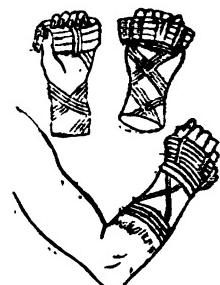

CESTRA'CION, a genus of sharks, regarded as constituting a distinct family, *Cestracionidae*, although not more than two species are known as now existing. It is characterised by having two dorsal fins and one anal, the first dorsal situated over the space between the pectorals and ventrals; a spine forming the front of each dorsal; a short

wide tail, with its upper lobe strongly notched beneath; the mouth at the fore-end of the snout; stout-holes distinctly visible, rather behind the eyes; eyes destitute of nictitating membrane; small gill-openings; and the front of the mouth armed with sharp angular teeth, whilst the margins and inner surface of the jaws are covered with pavement-like teeth, presenting a general continuity of surface, as in skates, and disposed in rounded oblique scrolls—the former evidently adapted to the sawing of food, the latter to the crushing and bruising of it. The Port-Jackson Shark or 'Nurse' (*C. Philippæ*) of the Australian seas, and the Cat Shark of Japan and China (*C. Zebra*), seem to differ chiefly in the patterns of colour. The *Cestracionidae* are particularly interesting to geologists; for the oldest fossil sharks belong in great part to this family, of which remains are found even in the Paleozoic strata; they become more numerous in the Carboniferous series; they are very numerous in the Lias and Chalk formations; but there they cease almost entirely, the strata of the Tertiary series scarcely containing any of them; whilst now the species are reduced, as we have seen, to one or two, and other types of shark have become more prevalent.

CESTRUM, the style or spatula used by the ancients in encaustic painting in wax and ivory. See ENCAUSTIC.

CESTUI QUE TRUST, a person who possesses the equitable right to deal with property, the legal estate in which is vested in a trustee. There is such a confidence between the cestui que trust and his trustee, that no action at law will lie between them, but they must settle their differences and arrange their disputes in a court of equity. The phrase cestui que trust is a barbarous Norman law French phrase, and is so ungainly and ill adapted to the English idiom, that it is surprising that the good sense of the English legal profession has not long banished it, and substituted some phrase in the English idiom, furnishing an analogous meaning.—Wharton's *Law Lexicon*, p. 130.

CE'STUS (Gr. *kestos*, embroidered), a girdle worn by Greek and Roman women close under the breasts,

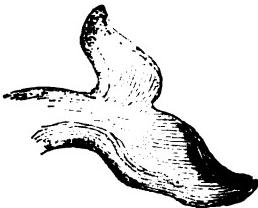

Roman Cestus.

and so distinguished from the zone, worn round the loins. The C. of Venus was covered with alluring representations, so that Juno borrowed it when she desired to win the love of Jupiter.—CESTUS—or, more correctly, *Cestros*, from the Lat. *cader*, to slay—is also the name of the covering for the hands worn by Roman pugilists. It was at first nothing more than a leathern thong or bandage to strengthen the fist; but afterward it was covered with knots and nails, and loaded with lead and iron, &c., to increase the force of the blow. It was not uncommon for a pugilist armed with the C. to dash out the brains or break the limbs of his antagonist. The Roman pugilist (*cestarius*) was often represented in sculpture.

CETA'ORA (Gr. *ketos*, a whale), an order of Mammalia (q. v.) greatly differing in general form and habits from the rest of that class, so as indeed to be popularly reckoned among fishes. The C. have a fish-like form, terminating in a fish-like tail or tail-fin, which, however, is not vertical, as in fishes, but horizontal, and is the great instrument of progression; being moved by very powerful muscles,

commonly with an oblique downward and lateral movement, like that by which a boat is propelled in sculling, but sometimes by direct upward and downward strokes, when greater velocity is requisite.

Tail-fin of Whale.

however, appearing in the skeleton as those of a hand, placed at the extremity of an arm, of which the bones are much abbreviated and consolidated, with little power of motion except at the shoulder-joint, and are entirely concealed in the soft parts of the animal. The head is connected with the body

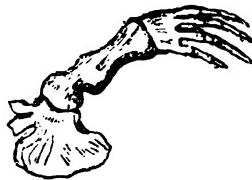

without any apparent neck, and the vertebrae of the neck are partly ankylosed or soldered together. The skin is naked, having no general covering of hair, although some of the species possess conspicuous whiskers. The C. agree with quadrupeds, notwithstanding

true C. have molar teeth or grinders like the *Manatidae*; all the teeth which any of them have are conical; but some of the largest are entirely destitute of teeth. The females of all of them have the teats situated far back on the abdomen. The fore-limbs of the true C. are mere fins, the slight power of grasping with them, which the *Manatidae* possess, having entirely disappeared. The resemblance to fishes is increased in many of them by the presence of a dorsal fin. There is a wonderful provision to enable them to spend some time under water, before returning again to the surface to breathe—an arterial plexus or prodigious intertwining of branches of arteries, under the pleura and between the ribs, on each side of the spine. This being filled with oxygenated blood, after the animal has spent some time at the surface breathing, the wants of the system are supplied from it, whilst breathing is suspended, so that some whales can remain below even for an hour. The position of the nostrils is remarkable, almost on the very top of the head, so that the animal can breathe as soon as the head comes to the surface of the water; and the nostrils are furnished with a valve of singular but very perfect construction, sort of conical stopper of fibrous substance, preventing the ingress of water even under the pressure of the greatest depths. The nostrils appear to be little used for the purpose of smelling, the sense of smell being one which these animals either do not possess at all, or in a very imperfect degree; but they are much used, not only for breathing, but also for *sputtering*, or the ejection of water from the mouth, for which reason they are generally called *blow-holes*—the water being forced through them by the compression of two large pouches or reservoirs which are situated beneath them. This compression is accomplished by an action similar to that of swallowing; the throat, however, not being open, but closed. The height to which the water is thrown into the air is extraordinary, and the sputtering of the whale is one of those wonders of the ocean never to be forgotten by those who have seen it.

A peculiarity in the skin of the true C. adapts them for their manner of life. The skin is extremely thick, the inner part of it consisting of elastic fibres interlacing each other in every direction, the interstices of which are filled with oil, forming the substance usually called *ubber*. The oil deposited in this unusual situation, not only serves the ordinary purposes of fat, but that also of keeping the body warm, which to a warm-blooded animal, continually surrounded with water, is of great importance; whilst the elasticity of this extraordinary skin affords protection in the great depths to which some of the whales descend, and in which the pressure must sometimes amount to a ton on every square inch.

The number of known species of C. is not great, but their natural history has as yet been very imperfectly studied. All of them are large animals, some of them by far the largest that now exist. Almost all of them—both herbivorous and ordinary—are marine, but some of the smaller species ascend large rivers to a great distance from the sea; and one, of the family *Delphinidae*, belongs exclusively to fresh waters, being found only in the upper tributaries of the Amazon and the elevated lakes of Peru.

*Fossil Cetacea* have been hitherto discovered only in the Tertiary formation. Their remains represent species not only belonging to each of the recent families of true C., but have supplied materials for forming a new family intermediate between the true whales and the herbivorous cetaceans. These fossils were originally described as reptiles; but they have been satisfactorily shewn to be carnivorous C. by Owen, who, from their remarkable conjugate

Bones of Fore-limb of Whale.

the great differences already indicated, in the most important parts of their organisation. They are viviparous, and suckle their young, for which they exhibit great affection; they are also warm-blooded, breathe by lungs, and not by gills, and come to the surface of the water for the purpose of inhaling air. An approach to their fish-like form is to be seen in Seals (q. v.) and other *Phocidae* (q. v.); in which, however, the hinder limbs are largely, although peculiarly developed, whilst the fish-like tail-fin is wanting; the skin has a covering of hair; and the head and fore-limbs more resemble those of ordinary quadrupeds.

The C. are usually divided into two sections—the *Herbivorous* and the *Ordinary* C.; but the former, constituting the family of *Manatidae* (q. v.), have recently, by some systematic naturalists, been rejected from this order altogether, and associated with the *Pachydermata*. They differ very widely from the ordinary or true C., not only in their adaptation for the use of vegetable instead of animal food, which appears both in their dentition and in their digestive apparatus, but also in their pectoral instead of abdominal teats, and in their want of *blow-holes* and of any provision for retiring to great depths of the ocean, and remaining there for a considerable time, without returning to the surface to breathe.

The ordinary or true C. are divided into the families of *Delphinidae* (Dolphin, Porpoise, Beluga, Bottlenose, Narwhal, &c.), *Physeteridae* or *Cetodontidae* (Cachalot, or Spermaceti Whale, &c.), and *Balaenidae* (Greenland Whale, Rorqual, &c.), the distinguishing characters of which are given under separate heads. They all feed on animal food, some of them pursuing and devouring fishes; others, and these the largest, subsisting chiefly on smaller prey, mollusks, small crustaceans, and even zoophytes, which they strain out of the water by a peculiar apparatus in their mouths. None of the

teeth, has given the typical genus the name of *Zeuglodon* (q. v.), and the family that of *Zeugodontida*. In all, six or seven species have been described belonging to this family, from the Eocene and Miocene beds of Europe and America. The *Dolphinidae* appear first in the Miocene strata, and continue through the newer beds. The remains of a Narwhal, which cannot be distinguished from the living species, have been found in several places in England. Of *Physeteridae*, three species have been noticed in Pleiocene and Pleistocene strata, belonging to the recent genus *Physeter*. Fossil *Balaenidae* occur in the Miocene and newer beds. Only four species have been described, if we exclude *Cetotolites* (q. v.), a name given to teeth and ear-bones, belonging to animals of this family, which occur in great numbers in the Suffolk Crag.

**CETOTOLITES**, a name given by Owen to fossil cetacean teeth and ear-bones, which occur in great abundance in the Red Crag of Suffolk, a member of the Pleiocene period. They are rubbed and water-worn, and have evidently been washed out of some earlier strata, which remain yet unrecognised. The extent of these earlier strata must have been very great, seeing that the remains now extend over a large district in Essex and Suffolk, and attain a thickness, in some places, of not less than 40 feet. Professor Henslow, in 1843, drew the attention of agricultural chemists to this deposit, as a source of materials for manure, and since then superphosphate manures have been manufactured from it to the value of many thousand pounds annually; a striking example of the valuable practical results which frequently flow from a purely scientific discovery.

**CETRA'RO**, a town of South Italy, in the province of Cosenza, situated on the Mediterranean, 24 miles north-west of Cosenza. It has anchovy fisheries, and a population of 2619.

**CETTE**, a seaport town of France, in the department of Hérault, is built on a neck of land between the lagoon of Thau and the Mediterranean, in lat.  $43^{\circ} 24'$  N., long.  $3^{\circ} 42'$  E. The town, which is entered by a causeway raised above the Thau lagoon, and a bridge of 52 arches, is fortified, and the harbour is defended by a citadel and forts. The space enclosed by the piers and breakwater forming the harbour is about 30 acres, and has a depth of from 16 to 19 feet. A broad deep canal, lined with excellent quays, connects the port with the Lake of Thau, and so with the Canal du Midi and the Rhone, thus giving to C. an extensive inland traffic; it has likewise an active foreign commerce. The principal trade is in wine, brandy, salt, dye-stuffs, perfumery, and verdigris. Other chief imports are wool, cotton, grain, oil, and colonial produce. C. has ship-building yards, and fisheries of oysters and anchovies. Pop. (1872) 24,103.

**CEUTA**, a town belonging to Spain, situated in the kingdom of Fez, on the north coast of Africa, and opposite to Gibraltar, in lat.  $35^{\circ} 54'$  N., and long.  $5^{\circ} 16'$  W. It is strongly fortified, and defended by a citadel and forts erected on Mount Hacho, the ancient *Abyla*, or South Pillar of Hercules. It is the most important of the four Spanish *presidios*, or convict establishments, on this coast. The harbour is small and not very safe; and the population, which amounts to 8200, is composed of Spaniards, Moors, Negroes, Mulattoes, and Jews, mostly very poor, and employed in trade and fisheries. Many of the Spaniards living here are state-prisoners, and even the garrison is partly manned by convicts. C., formerly called *Sepia* or *Septum*, was taken from the Vandals in 534 by Justinian, who fortified the place anew. In 618, it fell into the hands of the Western Goths; afterwards it was taken by the

Moors, who held it until 1415, when it was captured by the Portuguese. It was annexed with Portugal, to the crown of Spain in 1580, and was the only place on the African coast retained by Spain when Portugal was restored to its independence in 1640.

#### CEVADILLA. See SARADILLA.

**CEVENNES** (ancient *Cebessa*), the chief mountain-range in the south of France. With its continuations and offsets, it forms the watershed between the river-systems of the Rhone and the Garonne. Its general direction is from north-east to south-west, commencing at the southern extremity of the Lyonnais mountains, and extending under different local names as far as the Canal du Midi, which divides it from the northern slopes of the Pyrenees. The central mass of the C. lies in the departments Lozère and Ardèche, Mont Lozère reaching an elevation of 4884 feet, and Mont Mézenc (the culminating point of the chain) an elevation of 5794 feet. The average height is from 3000 to 4000 feet. Their masses consist chiefly of amphibolic rocks, grauwacke, and limestone, covered with tertiary formations, which in many places are interrupted by volcanic rocks.

The C. has been celebrated as the arena of religious warfare. As early as the 12th c., the several sects known by the names, the 'Poor of Lyon,' the *Albigenses* (q. v.), and the *Waldenses* (q. v.), were known and persecuted in this district. After the revocation of the Edict of Nantes by Louis XIV. in 1685, a series of cruel persecutions of the Protestants in the C. began, especially in 1697, after the Peace of Ryswick. 'Dragonnades' (q. v.) were employed to enforce the doctrines of the monks sent as missionaries into the heretical district. All persons suspected of Protestantism met with the most harsh and cruel treatment. Some of the inhabitants emigrated, others fled into the fastnesses of the mountains. Driven to desperation, the persecuted people at length rose to arms, and the murder of the Abbé du Chaila, who was at the head of the dragonnades, gave the signal of a general insurrection in 1702. The insurgent peasants were styled *Camisards*—possibly from *camise*, a smock worn by the peasantry. Headed by bold leaders, the most famous of whom were Cavalier and Roland, they defeated the troops sent against them by Louis again and again, until that king thought the insurrection of sufficient importance to require the presence of the distinguished general, Maréchal Villars; but he was recalled before the revolt had been put down, and it was left to the Duke of Berwick to extinguish it in blood; the contest terminating in an entire desolation of the province, and the destruction or banishment of a great portion of the inhabitants. The embers of religious hatred still remained glimmering through the following century, and, after the restoration of the Bourbons in 1815, burst out into flames in the terrible persecution of the Protestants in Nîmes (q. v.) and other places in the south of France. See *Histoire des Troubles des Cévennes, ou de la Guerre des Camisards* (Villefranche, 1760), and Schulz's *Geschichte der Camisarden* (Weimar, 1790).

#### CEYLANITE. See SPINEL.

**CEYLO'N** (the *Taprobane* of the Greeks and Romans, and the *Serendib* of the *Arabian Nights*), a valuable island and British colony in the Indian Ocean, to the south-east of the peninsula of Hindustan, from which it is separated by the Gulf of Manaar and Palk's Strait. Recent observations have shewn its true place to be between  $5^{\circ} 55'$  and  $9^{\circ} 51'$  N. lat., and  $79^{\circ} 42'$  and  $81^{\circ} 55'$  E. long. Extreme length from north to south, from Point

Palmyra to Dondra Head,  $271\frac{1}{2}$  miles; greatest width, from Colombo to Sangemankande,  $137\frac{1}{2}$  miles. Area, including dependent islands, 26,742 square miles.

**Physical Features.**—In natural scenery, C. can vie with any part of the world; and as it rises from the ocean, clothed with the rich luxuriance of a tropical vegetation, it seems to the voyager like some enchanted island of Eastern story. Its hills, 'draped with forests of perennial green,' tower grandly from height to height, till they are lost in clouds and mist. Near at hand, a sea of sapphire blue dashes against the battlemented rocks that occur at isolated points, and the yellow strands are shaded by groves of noble palms. In shape, C. resembles a pear, but its inhabitants more poetically compare it to one of their elongated pearls. Undulating plains cover about four parts of the island, and the fifth is occupied by the mountain-zone of the central south, which has an elevation of from 6000 to 8000 feet above the sea-level. Pedrotallagalla, the highest mountain in the range, attains the height of 8280 feet; the celebrated mountain of Adam's Peak, 7420 feet; and the table-land of Neuera Ellia, 6210 feet.

**Geology.**—The mountain system is mainly composed of metamorphic rocks, chiefly gneiss, frequently broken up by intruded granite. With the exception of some local beds of dolomitic limestone, the gneiss is everywhere the surface rock, and the soil is composed of its disintegrated materials. No fossils, as was to be expected, have been noticed in C., if we except the semi-fossil remains of mollusca, crustaceae, and corals, belonging to living species, which occur in the rude breccias of the north in the neighbourhood of the sea. The northern part of the island is rising, and there also the land is making encroachments on the sea from another agency. The immense masses of corals continually increasing, retain the débris brought from the Indian continent by the currents of the sea, and thus form a flat, ever-increasing madrepore plain.

Of metals and minerals, iron, in the form of a carbonate, can be obtained in great quantities, and of such purity as to resemble silver. Tin is found in the alluvium at the base of the mountains, and on the heights the rare metal tellurium has been discovered. Nickel and cobalt are scarce. Anthracite and rich veins of plumbago exist on the southern range of hills. The gems of C. have been celebrated from time immemorial, and they are most plentiful in the alluvial plains at the foot of the hills of Saffragam. Sapphires, rubies, the oriental topaz, garnets, amethysts, cinnamon stone, and cat's-eye, are the principal gems and precious stones of the island. The most valuable is the sapphire; and one of these, found in the year 1853, was worth more than £4000. The value of the precious stones annually found in the island has been estimated at £10,000. The pearl-fishery in the Gulf of Manaar has long been celebrated, and the revenue derived from it by government for the year ending 31st December 1857 was £20,550, 15s. 6d. Eighty-seven seconds is about the longest time the best divers can remain under water, and 13 fathoms is the greatest depth to which they descend.

**Rivers.**—The most important river in C. is the Mahawelli-ganga. It has its source in the vicinity of Adam's Peak, and after draining more than 4000 square miles, it separates into several branches, and enters the ocean near Trincomalee. The south side of the island is watered by ten rivers of considerable size, which flow into the sea between Point de Galle and Manaar. On the east coast, the rivers are smaller, but still more numerous, and many others traverse the northern and eastern provinces.

**Harbours.**—Point de Galle (q. v.) and Trincomalee (q. v.) are the two harbours of Ceylon. The former is small and dangerous, but the latter is unsurpassed as a safe and commodious port. The variation of the tides is very trifling; the rise and fall not generally exceeding 18 to 24 inches, with a third of increase at spring-tides.

In climate, C. has a great advantage over the mainland of India, and as an island, enjoys a more equable temperature. The average for the year in Colombo (q. v.) is  $80^{\circ}$  in ordinary seasons. April is the hottest month; and in May the south-west monsoon commences amid a deluge of rain, and continues the prevailing wind till October, when the north-east monsoon sets in: 80 inches is the average annual fall of rain, though in an exceptional year, 120 inches have been registered. The beautiful table-land of Neuera Ellia was first visited by Europeans in 1826, and is now used as a sanatorium. Here the thermometer in the shade never rises above  $70^{\circ}$ , while the average is  $62^{\circ}$ ; the nights are cool and refreshing. The north of the island, including the peninsula of Jaffna, the plains of Neuera Kalawa, and the Wanny, may be reckoned as a third climatic division. Here the annual fall of rain does not exceed 30 inches, and irrigation is largely employed in agriculture.

**Flora.**—The general botanical features of C., especially of the lowlands, are nearly identical with those of Southern India and the Deccan, although it possesses a few genera of plants not to be found in those regions. Its phanerogamic plants are limited to about 3000. The beautiful ixoras, erythrinias, buteas, Jonesias, and other flowering shrubs bloom in the forests. At an elevation of 6000 feet, the scandentaceae cover large tracts of ground, and the tree-fern reaches the height of 20 feet. On the highest ground, rhododendrons attain to the size of timber-trees. The Coral-tree (*Eurythrina Indica*), the Murutu (*Lagerstroemia Regia*), and the Jonesia asoca are amongst the most magnificent of the flowering trees. The fig tribe are planted in the vicinity of the temples. In the forests, climbing-plants and epiphytes of prodigious size and striking appearance cover the trees with a mass of parasitical foliage of extraordinary growth. The Palmaeae are very conspicuous in the vegetation of C., although not more than 10 or 12 species are indigenous: the cocoa-palm—of which it is estimated there are not less than 20 millions of trees—the talipot, the palmyra—which forms extensive forests in the north of the island—and the jaggery palm, are the most noteworthy. Of timber-trees, 90 species are known, and amongst these the satin-wood holds the first rank. The flora of the highlands, above 2000 feet, and up to 6000 or 7000, though much resembling that of the Nilgherries, has a marked affinity to the vegetation of the highlands of Malacca and Java, especially the latter.

**Fauna.**—A knowledge of the fauna of C. has been greatly advanced by the labours of Drs Templeton and Kelaart and Mr Edgar Layard. Quadrumanous animals are represented by the *Loris griseus*, and five species of monkeys. Sixteen species of the *Cheiroptera* or bat tribe, exist in C.; and what is very remarkable, many of these rival the birds in the brilliancy of their colours. The *Pteropus Edwardsii* (the flying-fox of Europeans) measures from 4 to 5 feet from tip to tip of its extended wings. Of the larger *Carnivora*, the bear and leopard; and of the smaller, the palm-cat and the glossy genette (the civet of Europeans) may be mentioned. The dreaded tiger of India, the cheeta, the wolf, and the hyena, are happily not met with in Ceylon. Deer, buffaloes, and the humped ox of India are amongst the *Ruminantia*; the little musk-deer (*Moschus memina*)

is less than two feet in length. The *Pachydermata* are represented by the elephant and the wild boar; the former, which is for the most part tuftless, is emphatically lord of the forests of Ceylon. The most remarkable of the *Cetacei* is the dugong. Whales are captured off the coast. 320 species of *Birds* have been ascertained by Drs Templeton and Kelaart and Mr Layard. The song of the robin and long-tailed thrush, and the flute-like voice of the oriole, are heard over the whole mountain zone, and far down into the neighbouring plains. Eagles, the beautiful peregrine falcon, owls, swallows, kingfishers, sun-birds, bulbul, crows, paroquets, pigeons, pea-fowl, jungle-fowl, and many others of the feathered tribe might be mentioned did space permit. Myriads of aquatic birds and waders, amongst which the flamingo is conspicuous, cover the lakes and lagoons. The crocodile is the largest reptile in the island; tortoises and lizards are also found. There are a few species of venomous snakes, and of these the tiropolonga and the cobra da capello are the most deadly.

*Inhabitants.*—The Singhalese, the most numerous of the natives of C., are the descendants of those colonists from the valley of the Ganges who first settled in the island 543 B.C. In their customs, costume, and general appearance, they have remained unchanged since the days of Ptolemy. The dress of the men, who have delicate features and slender limbs, is singularly effeminate, and consists of a *comboy* or waist-cloth, very much resembling a petticoat; their long hair, turned back from the forehead, is confined with combs, and earrings are worn by way of ornament. The women, in addition to the *comboy*, cover the upper part of the figure with a white muslin jacket, and adorn themselves with necklaces, bangles, rings, and jewellery. The Singhalese are false and cowardly, but manifest a strong affection for their relatives, and a reverence for old age. Polyandry still lingers in the interior of C., and was formerly universal; it is now, however, chiefly confined to the wealthier classes, amongst whom one woman has often three or four husbands. The Kandyans, or Highlanders, are a more sturdy race, and maintained their independence for three centuries after the conquest of the low country by European settlers. The Malabars, or Tamils, have sprung from those early invaders of C., who from time to time swept across from Southern Hindustan, and contended with the Singhalese kings for the sovereignty of the island. They have formed the chief population of Jaffna for full 2000 years, and constitutionally excel the Singhalese and Kandyans. The Moormen, who are the most energetic and intelligent of the native communities, are met with in every province as enterprising traders. They are a very distinct race from the Singhalese, but have no tradition of their origin. Europeans generally believe them to be of Arab descent, but Tennent is of opinion that 'they may be a remnant of the Persians, by whom the island was frequented in the fourth and fifth centuries.'

The 'burghers' of C. are a people of European descent, who have become naturalised. Those of Portuguese extraction hold the lowest place, and are mostly tradesmen and artisans; but the Dutch burghers frequently fill responsible posts, and are employed in the government offices.

Besides the races already alluded to, there is a remarkable tribe of outcasts—the Veddahs—hardly removed from the wild animals of the forest, and believed to be descended from the Yakkhos, the aboriginal inhabitants of the country. They occupy a district in the eastern part of the island, and have there preserved their ancient customs and

manner of living unaltered for more than 2000 years. They appear to be without the instinct of worship, and have no knowledge of a God. The tribe is divided into the *Rock Veddahs* and the *Village Veddahs*. The former hide themselves in the jungle, live by the chase, and sleep in trees or caves. They use fire to cook their meat, and their greatest gastronomic treats are the iguana lizard and roasted monkey. Their language—if the few words they make use of can be called by that name—is a dialect of the Singhalese. The Village Veddahs locate themselves in the vicinity of the European settlements, on the eastern coast, living in rude huts of mud and bark, and are hardly more civilised than their brethren of the jungles. The exertions of government to reclaim this harmless but degraded people have in some degree succeeded, and a promising colony has been formed.

*Population.*—Sir J. E. Tennent is of opinion that C., when in the height of its prosperity, must have been ten times as densely peopled as at the present day. In the official returns for the year 1870, the area and population of the six provinces of Ceylon are given as follows (total pop. in 1871, 2,405,287):

Province.	Area in Sq. Miles.	Total Population.	Pop. per Sq. Mile.
Western, . . . . .	3,343	662,658	198·11
North-western, . . . . .	2,805	214,699	76·54
Southern, . . . . .	1,927	351,969	183·59
Eastern, . . . . .	4,545	96,801	21·25
Northern, . . . . .	6,062	426,597	70·36
Central, . . . . .	5,770	371,466	64·37
Total, . . . . .	24,454	2,126,037	86·34
Military, . . . . .	....	3,847	11
Total (includ. military)	....	2,129,884*	87·05

*Religion.*—The Singhalese are devoted to Buddhism (q. v.), which is the prevailing religion of the island. It does not exist, however, in that state of purity in which it is still found in the Indo-Chinese peninsula. Its sacred books are identical with those of Burmah and Siam, and both record the doctrines of Gautama in the Pali language; the deviations are in matters of practice. The Malabar kings adulterated Buddhism to a considerable extent with Brahmanism, introducing the worship of Hindu deities into the Buddhist temples, and this continues more or less to be the case. More than once have the Buddhists of C. sought to restore the purity of their faith—at one time sending deputies to Siam, at another to Burmah, with this object in view. The Burman or Amarapura sect have long been the reformers of Singhalese Buddhism, and maintain no very friendly relations with the party, who, supported by the priests of Siam, acknowledge the civil power in matters of religion, sanction the worship of Hindu deities and the employment of the priesthood in secular occupations, uphold caste, and restrict the sacred books. Caste was acknowledged by the Singhalese prior to the introduction of Buddhism, which in principle is opposed to it; but so firmly was it rooted, that it still endures, though more as a social than a sacred institution. Gautama Buddha is said to have visited C. three different times to preach his doctrine, and his *Sri-pada*, or sacred footprint, on the summit of Adam's Peak (q. v.), still commands the homage of the faithful. Buddhism was not, however, permanently introduced into C. till 307 B.C., when Mahindo, obtaining the support of the king, established it as the national faith. The influence of the priests gradually increased, and, by

\* Including 4732 British and 14,901 whites of European descent.

CEYLON.

least accessible to its influence. Schools, collegiate institutions, and female seminaries, under the direction of the missionaries, are in successful operation.

**Government.**—The administration of C. is vested in a governor, who is assisted by an executive council of five members, and a legislative council of fifteen members. The governor's salary is £7000 per annum. In 1871, the revenue was £1,121,679, and the expenditure £1,064,184. The chief items of revenue are the customs, averaging £286,000; licences, £150,000; sales and rents of public lands, £230,000. The colony made very great progress under the able administration of Sir H. Ward. An objectionable tax, however, on the import of grain, and also on its home cultivation, still exists.

The following are the trade returns for the five years 1867 to 1871:

Year.	Imports.	Exports.
1867, . . .	£4,504,339	£3,530,225
1868, . . .	4,403,177	3,786,722
1869, . . .	4,635,023	3,631,065
1870, . . .	4,634,297	3,803,730
1871, . . .	4,737,592	3,634,853

Year.	Exports from Ceylon to the United Kingdom.	Imports of British Home Produce into Ceylon.
1867, . . .	£3,224,512	£771,879
1868, . . .	3,671,494	828,463
1869, . . .	3,749,728	796,372
1870, . . .	3,450,974	908,415
1871, . . .	3,167,678	928,807

The value of the staple coffee exported from Ceylon to the United Kingdom was, in 1867, £2,814,060; in 1868, £2,986,479; in 1869, £2,867,724; in 1870, 2,790,898; and in 1871, 2,623,263. In 1870, coco-nut oil, valued at £202,316, and raw cotton at £56,947, were exported to the United Kingdom. To the ancient world, C. was famous as a place of traffic. Egyptians, Greeks, Romans, Persians, and Arabians traded to its ports; and many particulars, such as geographical position and natural productions, seem to identify Point de Galle with the Tarshish of the Hebrew historians.

The history of C., of which the limits of this article will only allow the briefest possible outline, may be conveniently divided into ancient and modern, and the latter into the Portuguese, Dutch, and British periods.

The records of its early history came to light in 1826, and Mr Turnour, devoting himself to their study, composed an *Epitome of the History of C.*, from the year 543 B.C. to 1798 A.D.; and he records the reigns of 165 kings, who reigned during this space of 2341 years. The most famous of the Singhalese books is the *Mahavanso*, a metrical chronicle, in the Pali language, which gives an account of the island during the above 23 centuries. The story begins with the invasion of Wijayo (543 B.C.), son of a petty Indian sovereign in the country watered by the Ganges. He subdued the Yakkhos, the aboriginal inhabitants; married a daughter of one of the native chiefs, whom he subsequently repudiated for an Indian princess; and founded a dynasty that held undivided sovereignty in C. for nearly eight centuries. He bestowed on his kingdom his patrimonial name of Sihala (whence Singhalese, Ceylon), and promoted the settlement of colonists from the mainland. In the reign of king Devanipatiassa (307 B.C.), Buddhism was established as the national religion, and his reign was further remarkable by the planting of the sacred Bo-tree, 288 B.C.; and now commenced the erection of those stupendous buildings already noticed. The next important epoch in Singhalese history is the

usurpation of the Malabars (237 B.C.), foreign mercenaries from the Coromandel coast, to whom the native sovereigns had intrusted the defence of the island. Several Malabar invasions are chronicled in the history of C., and these foreigners long contended with the native princes for supreme authority. Passing on to 1071 A.D., a native dynasty was then re-established in the person of Wijayo Bahu, which, for 100 years, delivered the country from the dominion of the Malabars. Prakrama Bahu commenced a reign, in 1153, the most renowned in the records of Ceylon. He devoted himself to religion and agriculture, and besides many notable religious edifices, he caused no less than 1470 tanks to be constructed, subsequently known as the 'seas of Prakrama.' Thirty years after the death of this monarch, the Malabars landed with a large army, and speedily conquered the whole island. In 1236, a native dynasty recovered a part of the kingdom. During the reign of Dharmas Prakrama IX. the Portuguese first visited C., 1505; but it was in 1517 that they first formed a permanent settlement at Colombo for trading purposes. Their encroachments soon raised the patriotic Kandyan, and it is a remarkable fact, that though at the first visit of the Portuguese in 1505 they were even ignorant of the use of gunpowder, they, after a while, excelled their enemies as musketeers, and were finally able to bring 20,000 stand of arms to bear against them. 'Amity, commerce, and religion,' was the Portuguese motto; but their rule in C. is a sad story of rapacity, bigotry, and cruelty. They were at last driven from the island by the Dutch in 1658, after a contest of twenty years, when, as Sir J. E. Tennent remarks, 'the fanatical zeal of the Roman Catholic sovereign for the propagation of the faith, was replaced by the earnest toil of the Dutch traders to intrench their trading monopolies; and the almost chivalrous energy with which the soldiers of Portugal resisted the attacks of the native princes, was exchanged for the subdued humbleness with which the merchants of Holland endured the insults and outrages perpetrated by the tyrants of Kandy upon their envoys and officers.' But the purely military tenure of the Dutch was destined to give place to the colonisation of the British. It was during the great European war succeeding the French Revolution, that the English gained possession of the island. On the 1st August 1795, an expedition under Colonel James Stuart landed at Trincomalee, which was speedily captured, and finally the garrison of Colombo surrendered on the 16th February 1796. By this capitulation, all the Dutch settlements and strongholds in C. were ceded to the English; though the island was not formally annexed to the British crown till the Peace of Amiens, 27th March 1802. The native sovereigns, however, continued in the possession of their mountain territory; but at length the Kandyan king, Wikrama Raja Singha, after perpetrating the most frightful atrocities on his own people, seized and murdered certain native merchants, British subjects, trading to Kandy. War followed, January 1815; Kandy was taken, and the tyrant sent a captive to the fortress of Vellore. On the 2d March 1815, a treaty was concluded with the native chiefs, by which the king was formally deposed, and his territories annexed to the British crown.

Since then, the island has made rapid strides in material prosperity. The mountain-forests have been replaced by plantations of coffee, of which, in the year 1867, there were 403 under cultivation, giving an average crop of 347,100 cwt. per annum. Many important public works have been completed, and others are still in progress. A magnificent mountain-road now connects Colombo with

Kandy, and there is a railway 75 miles in length.

See *Ceylon, Physical, Historical, and Topographical, &c.*, by Sir James Emerson Tennent (Lond. 1859), a very complete and learned work on the island, written in popular and eloquent language; and *Christianity in Ceylon*, by the same author (Lond. 1850); *The Statesman's Year-book* (1873).

**CEYX.** See KINGFISHER.

**CEZIMBRA.** a coast town of Portugal, in the province of Estremadura, about 18 miles south of Lisbon. C. has active fisheries, and a pop. of 5000.

**CHABLIS,** a village in France, dep. of Yonne, which gives name to a much esteemed white Burgundy (q. v.) wine.

**CHA'CMA.** See BABOON.

**CHADDA.** See BENUWE.

**CHADWICK, EDWIN, C.B.** a distinguished social and sanitary reformer of the present day, born in the vicinity of Manchester, 24th January 1801. He studied law, but early devoting his attention to questions of social, sanitary, and political science, he attracted the notice of Lord Grey's government, by whom he was appointed an assistant-commissioner to inquire into the operation of the poor-laws in England and Wales. His report, published with others in 1833, commanded most attention, being remarkable alike for the wide and searching character of its investigations, the happiness of its illustrations, and the convincing proofs it furnished as to the necessity of reform in the system of administration. Its merit was recognised by those who had the power to reward him; and on the organisation of the new Poor-law Board, C. was appointed secretary. In connection with this Board, and the General Board of Health, C. for twenty years was energetic in the origination and administration of remedial measures relative to the distribution of poor-law funds and to the sanitary condition of the country. He has also given much attention to the constitution of the constabulary force, with a view to the better prevention of offences and the readier detection of criminals. On a change being made in the Board of Health in 1854, C. retired with a pension. He has since taken great interest in promoting competitive examinations for government offices, and indeed in almost all questions of social economy. He has been an active member of the Association for the Promotion of Social Science. In 1859—1860, he collected evidence for the Education Commission.

**CHÆRONE'I'A,** a city of Boeotia, in ancient Greece, near the Cephissus, on the borders of Phocis. It is celebrated on account of several important battles fought in the neighbourhood. In 447 B.C., the Boeotians here obtained a victory over the Athenians; and in 338 B.C., Philip of Macedon signally defeated the united forces of the Athenians and Boeotians, and so crushed the liberties of Greece. A mound of earth, about a mile from the modern village of Kapurna, which occupies the site of the old city, still marks the place where the Thebans who fell in the battle were buried; and a magnificent lion, which Colonel Mure pronounced to be 'the most interesting sepulchral monument in Greece,' was excavated from this tumulus some years ago. At C., also, 86 B.C., Sulla defeated the generals of Mithridates. Plutarch was a native of this town. A few ancient remains yet exist.

**CHA'TODO'NTIDA'**, a family of acanthopterous fishes, nearly corresponding to the genus *Chaetodon* (Gr. hair-tooth) of Linnaeus; and also named **SQUAMIPENNES** (Lat. scaly-finned), because of the most distinctive character of the family, the

incrustation of the soft portions of the dorsal and anal fins, and often of the spinous parts also, with scales, the fins appearing to taper gradually out of the thickness of the body, which is in general remarkably compressed, so that, without dissection, it is impossible to tell where they begin. The scales are strongly ctenoid (q. v.). The typical genus *Chaetodon*,

*Chaetodon.*

and those most nearly allied to it, have hair-like teeth, so that their jaws resemble brushes; some fishes of the family, however, have trenchant teeth on the jaws, and some, as *Brama* (q. v.), have card-like teeth both on the jaws and palate. Most of the C. are tropical; only one species, *Brama Rasi*, is ever found in the British seas. They generally frequent rocky shores. Their colours are often extremely gay, and usually disposed rather in stripes or bands than in spots. The eye of man receives the greater pleasure from their contemplation, in that, being of moderate or small size, and haunting habitually the coral basins of the transparent tropical seas, they disport themselves in the beams of a vertical sun, as if desirous of exhibiting their splendid liveries to the greatest advantage in the blaze of day.' Many singularities of form occur in this family, as the long slender snout of the *Chelmons*, the whip-thong-like prolongation of some of the rays of the dorsal fins in *Heniochus* and *Zanclus*, the wing-like dorsal and anal fins of *Platax*, the sharp recurved horns of the Buffalo-fish (*Taurichthys*), &c. To this family belong the Archer-fishes (q. v.), whose singular habits have been already noticed.—The flesh of most of the C. is of very fine flavour.

**CHAFER,** a common name of those beetles or coleopterous insects, which either in the perfect or larva state, are destructive to plants; particularly those which devour the wood, bark, or roots of trees. From these, however, it is sometimes extended to some coleopterous insects which have no such habit. The word C. is seldom used alone, but generally as part of a name, with some prefix; thus, we have *Cock-chafers*, *Rose-chafers*, *Bark-chafers*, &c.

**CHAFF-CUTTER,** a name commonly given to an implement now much used by farmers for cutting hay and straw into half-inch lengths. The advantage of this consists not so much in facilitating mastication or digestion, as in preventing animals from wasting their food. No small amount of mechanical ingenuity has been applied to the construction of chaff-cutters, the simplest and oldest kinds of which are mere hand-machines with a single large knife, the hay or straw being pushed forward in a trough or box, whilst others are driven by horse, steam, or water power, and are not a little complicated.

**CHAFFINCH** (*Fringilla coelebs*), one of the most common British birds, a species of Finch (q. v.), and probably that to which the name Finch, now so extended in its signification, originally belonged; *fink*, the German form of the name, and *pint* and *twaite*, English provincial forms still appropriated to

the C., having some resemblance of sound to its common call-note. The whole length of the C. is about six inches. The tail is very slightly forked. The male, in summer, has the top of the head and nape of the neck bluish-gray; the back, chestnut; the wings almost black, with two conspicuous white bars; the tail, nearly black. The colours of the female are much duller than those of the male. The C. is a very widely distributed species, being found in almost all parts of Europe, in some parts of Asia, in the north of Africa, and as far west as the Azores. In the colder northern countries, it is migratory; in more southern regions, it is stationary. Linnaeus gave it the specific name *celebs*, from observing that the flocks congregated in winter in Sweden consisted chiefly of males, the females having, as he supposed, sought a milder climate. A partial separation of the sexes is observed also in the great winter-flocks in Britain, but it is only partial; and Yarrell thinks that the young males of the previous season, which resemble the females in plumage, are associated with them, and have been mistaken for them. The flocks seen in Britain in winter are believed to be augmented by migration from Scandinavia. The eggs are usually four or five in number, of pale purplish buff colour, sparingly streaked and spotted with reddish brown. The C. feeds chiefly on insects, and does much service in summer by destroying aphides and caterpillars; but eats also seeds, and is sometimes persecuted, because in spring it pulls up and eats young turnips and radishes when in the seed-leaf. Great numbers of chaffinches are killed for the table in Italy. In Germany, this bird is in the highest esteem as a song-bird. Its notes are very clear and loud, but some individuals greatly excel the ordinary multitude of their species; and their superior notes, if heard on the Thuringian hills, speedily attract bird-catchers. Bechstein says that, in Thuringia, a cow has been given for a C. with a fine voice; and the Germans have taken the trouble to classify the different strains of chaffinches, giving them distinct names, and regarding those birds as particularly valuable by which certain of these strains are produced.—The common Scotch name of the C. is *Shilfa*.

CHAGRES, a river entering the Gulf of Darien on the north side of the Isthmus of Panama, near lat. 9° 18' N. Though, towards its mouth, it varies in depth from 16 to 30 feet, it is yet, by reason at once of its rapidity and its falls, but little available for navigation. At its entrance is a port of its own name. Both the town, however, and the stream have recently lost nearly all the advantages of their position, through the establishment of an inter-oceanic railway, which, on the Atlantic side, commences at Aspinwall, about 8 miles to the north.

CHAIN, in Surveying (called Gunter's Chain, from its inventor), is a measure of 22 yards long, composed of 100 iron links, each of which is thus 7.92 inches long. As an acre contains 4840 square yards, 10 square chains ( $22 \times 22 \times 10 = 4840$  square yards), or 100,000 square links, make an acre.

CHAIN-BRIDGE. See SUSPENSION BRIDGES.

CHAIN-CABLE. See CABLE.

CHAIN-MAIL, or CHAIN-ARMOUR, much used in the 12th and 13th centuries, consisted of hammered iron links, connected one to another into the form of a garment. Such armour was much more flexible and convenient to the wearer than that which was formed of steel or brass plates, but was less fitted to bear the thrust of a lance.

CHAIN-SHOT, chiefly used in naval warfare, are very destructive missiles, consisting of two balls connected by a piece of chain eight or ten inches in

length. All is fired collectively from the gun, and the chain enables the balls to catch and destroy objects which otherwise might possibly escape.

CHAINS, on shipboard, are strong iron links or plates, bolted at the lower end to the ship-timbers, and having a block or *dead-eye* at the upper end. Their purpose is to fasten down the shrouds tightly. They are brought out laterally at the top by resting in the middle against the channels, which are broad thick planks, very strongly fixed, and projecting horizontally from the side of the ship, one pair for each mast.

CHAINS, HANGING IN. In atrocious cases, it was usual for courts of justice, in former times, to direct the bodies of malefactors, after execution, to be hung in C. upon a gibbet near the spot where the crime was committed; but this, says Blackstone, 'was no part of the legal judgment.' The reasons commonly assigned for the practice are two: first, that it might strike terror into other offenders; and second, that it might afford 'a comfortable sight to the relations and friends of the deceased.' This barbarous adjunct to capital punishment was not finally abolished till a very recent period, and it may surprise our readers to learn that, two years after the passing of the Reform Bill, it was still in accordance with the law, if not with the custom of England. The act 'to abolish the practice of hanging the bodies of criminals in chains' (4 and 5 Will IV. c. 26), was passed on 25th July 1834. The last case of hanging in C. mentioned as having occurred in Scotland, is that of Andrew Wilson, who poisoned his wife in 1755 (Hume, vol. ii., p. 482). See PUNISHMENTS and DISSECTION.

CHALA'ZA, in Botany, a membrane which unites the nucleus and integuments at the base of an ovule. It is traversed by vessels which supply nourishment to the ovule. It is often of a different colour from the rest of the integuments, and is conspicuous in the ripened seed; but it is sometimes difficult to distinguish it, particularly in *orthotropous* seeds, when it is in contact with the *hilum*, the *torus*, or *micropyle* being at the opposite extremity of the seed. See OVULE and SEED.

The cords which bind the yolk-bag of an egg to the lining membrane at the two ends of the shell, and keep it near the middle as it floats in the albumen, are also called *chalaza*. They appear to be formed of a peculiarly viscid albumen.

CHALCEDON, a city of ancient Bithynia, at the entrance of the Euxine, opposite to Byzantium. It was founded 634 B.C. by a colony from Megara, and soon became a place of considerable trade and importance. It contained several temples, one of which, dedicated to Apollo, had an oracle. C. was taken by the Persians, suffered the vicissitudes of war during the strife for Grecian supremacy between the Athenians and Lacedaemonians, and finally merged into the Roman empire. During the Mithridatic war, it was the scene of a bold exploit of the Pontic sovereign. Having invaded Bithynia, all the wealthy Romans in the district fled for refuge to C., whereupon he broke the chains that protected the port, burned four ships, and towed away the remaining sixty. Under the empire it was made a free city, and was the scene of a general council, held 451 A.D. Chosroes the Persian captured it 616 A.D., after which it declined, until it was finally demolished by the Turks, who used its ruins to build mosques and other edifices at Constantinople. C. was the birthplace of the philosopher Xenocrates.

The council of C., to which allusion has been made, was the fourth universal council, and was assembled by the emperor Marcian for the purpose of drawing up a form of doctrine in regard to the nature of

## CHALCEDONY—CHALEUR BAY.

Christ, which should equally avoid the errors of the Nestorians (q. v.) and Monophysites (q. v.). Six hundred bishops, almost all of the Eastern or Greek Church, were present. The doctrine declared to be orthodox was, that in Christ there were two natures, which could not be intermixed (this clause was directed against the Monophysites), and which also were not in entire separation (this was directed against the Nestorians), but which were so conjoined, that their union destroyed neither the peculiarity of each nature, nor the oneness of Christ's person.

**CHALCEDONY** (often misspelled *Calcedony*), a beautiful mineral of the quartz family, or rather a variety of quartz, from which it does not differ in chemical composition or in any essential character. It derives its name from Chalcedon in Bithynia, near which it is found in considerable abundance, and has been known by the same name from ancient times. It occurs in different kinds of rock, but most frequently in old lavas and trap-rocks, and is found in almost all parts of the world where these exist, or where there are boulders derived from them. It is common in Scotland, and specimens of great beauty are brought from Iceland and the Faroe Islands. It never occurs in crystals. It constitutes the whole or the principal part of many agates. It is generally translucent, sometimes semi-transparent, has not much lustre, and is in colour generally white or bluish white, sometimes reddish white, sometimes milk-white, less frequently gray, blue, green, yellow, brown, or even black. Its fracture is even, or very slightly conchoidal.—C. is much used in jewellery, for brooches, necklaces, and ornaments of all sorts, the largest pieces being sometimes made into little boxes, cups, &c. It was much used by the ancients, and many beautiful engraved specimens appear in antiquarian collections. Chalcedomies with disseminated spots of brown and red, were once very highly prized, and were called *Stigmatis* or *St Stephen's-stones*. Petrified plants are sometimes found in C., in which they appear to have been encased whilst it was in course of formation. Specimens of C. are sometimes found enclosing a little water in the interior, which gives them a very beautiful appearance; but the water easily escapes, to prevent which, rings or other ornaments made of such stones are kept in distilled water, when not worn. The ancients set a very high value on these *hydrates* (Gr. *ea*, in, and *hydor*, water). The Vicentin was celebrated for producing them.

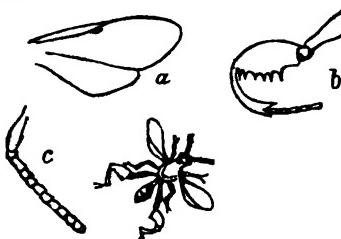

**CHALCEDONYX** (or, erroneously, *Calcedonyx*), a name given to agates formed of cacholong, or a white opaque chalcedony, alternating with a grayish translucent chalcedony.

**CHALCIS**, the capital town of the island and government of Eubœa, Greece, situated on the Euripus, a strait separating the island from Boœtia, and which at this point is only 120 feet wide. The Euripus is divided into two channels, of unequal breadth and depth, by a rock, which is surmounted by a castle, partly of Venetian and partly of Turkish construction. A stone bridge, of some 70 feet in length, connects the rock with the Boœtian shore, while a wooden and movable bridge, of about 35 feet, unites it with Chalcis. C. is a place of very great antiquity, having been founded, as tradition asserts, before the Trojan war, by an Ionic colony from Athens. Its rise was rapid. It sent out numerous colonies, and was the centre of the trade of the western Mediterranean. Governed at first by an aristocracy, it fell into the hands of the Athenians, who in 506 B. C. divided the lands of C. amongst some of their own number. It subsequently fell under the power of the Macedonians

and Romans, and was at this time a place of great military importance, nearly 9 miles in circumference, and had many fine temples, theatres, and other public buildings. Aristotle died at Chalcis. In the middle ages, it was prosperous under the Venetians, who held it for nearly three centuries, until its conquest by the Turks in 1470. The lion of St Mark is, or was until within recent years, still to be seen over the gateway between the bridge and the citadel. Not many ancient remains now exist at Chalcis. The streets are narrow, but the houses, many of which owe their origin to the Venetians, are substantial and spacious. Pop. 5000.

**CHA'LOIS**, a genus of Saurian reptiles, the type of a family called *Chalcida*, some of which are popularly termed snake-lizards, because of the resemblance to snakes in the elongated form of the body, the limbs being also remarkably small, so that this family forms one of the transition links between the Saurian and the Ophidian reptiles. The scales are rectangular, and arranged in transverse bands, without being imbricated or disposed like tiles. The *Chalcidae* are natives of warm climates, both in the old and new worlds.

The name C. has also been bestowed on a genus of the order *Hymenoptera*, allied to the Ichneumons, which has become the type of a tribe or family, containing a vast number of species—1500 being supposed to exist in Britain—all of them of small size, many very minute, many of them very brilliant in their colours, and the larvae of all of them parasitic in the larvae or pupæ, some even in the

*Chalcis Claripes,*

One of the largest British species :

a, the wings of one side, magnified (very destitute of nervures);  
b, hind-leg, magnified; c, antenna, magnified.

eggs, of other insects. The chrysalis of a butterfly or moth often nourishes a great number of these parasites; and they become useful in preventing the excessive multiplication of species which destroy valuable plants.

**CHALCOGRAPHY**, a pedantic term used to signify engraving on copper, compounded of the Greek words *chalkos*, brass or copper, and *grapho*, I write. The term is inaccurate when applied, as it often is, to engraving on other metals, such as steel and zinc. For zinc-engraving, the still more objectionable word *Ziacography* has been invented.

**CHALDAEA**. See BABYLON, BABYLONIA.

**CHALDER**. See ARAMEA.

**CHALDER**, an old Scotch dry measure, containing 16 bushels. See BOLL.

**CHALDRON** (Lat. *caldarium*, a vessel for warm water), an old dry measure used in selling coal, and containing 36 heaped bushels. Coal is now sold by weight.

**CHALEUR BAY**, an inlet of the Gulf of St Lawrence, between Gaspé, a district of Lower Canada, and New Brunswick, having a depth of 90 miles from east to west, and a width varying from

12 to 20. The Ristigouche, which enters the gulf from New Brunswick at its very head, marks, at its mouth, the inter-provincial boundary.

Chalice :

Found in a Stone Coffin of the 12th century in Chichester Cathedral.—Copied from Parker's *Glossary of Architecture*.

**CHALICE** (*Lat. calix*, a cup). This ancient name for an ordinary drinking-cup has been retained for the vessels used for the wine in the holy sacrament. Chalices are commonly made of silver, but it was not unusual for them to be of gold, or gilt and jewelled. Chalices were also made of glass, crystal, and agate; but these substances have been abandoned, in consequence of their fragile nature. The C. is the attribute of St John the Evangelist.

**CHALK**, a soft earthy variety of limestone or carbonate of lime, forming great strata, and claiming the attention of the geologist even more than of the mineralogist. It is generally of a yellowish-white colour, but sometimes snow-white. It is easily broken, and has an earthy fracture, is rough and very meagre to the touch, and adheres slightly to the tongue. It generally contains a little silica, alumina, or magnesia, sometimes all of these. Although often very soft and earthy, it is sometimes so compact that it can be used as a building-stone; and it is used for this purpose either in a rough state, or sawn into blocks of proper shape and size. It is burned into quicklime, and nearly all the houses in London are cemented with mortar so procured. The silicious particles being separated by pounding and diffusing in water, it becomes whiting, of which the domestic uses are familiar to every one. Carpenters and others use it for making marks, which are easily effaced: the black-board and piece of C. are now common equally in the lecture-rooms of universities and in the humblest village-schools. C., perfectly purified, is mixed with vegetable colouring matters, such as turmeric, litmus, saffron, and sap-green, to form pastil colours; but vegetable colours which contain an acid are changed by it. See CRAYON. The Vienna white of artists is simply purified chalk. In a perfectly purified state, it is administered as a medicine, to correct acidity in the stomach. C. is also extensively used as a manure. See LIME, as a manure.

**CHALK, BLACK**, is a mineral quite different from common chalk, and apparently receives its name from resembling it in meagreness to the touch, in soiling the fingers, and in being used for drawing, writing, &c. It is also called DRAWING-SLATE. It is of a slaty structure, of a bluish or grayish-black colour, easily cut and broken, and makes a perfectly black mark on paper. It is used for drawing, and as a black colour in painting. It becomes red by exposure to heat. It is essentially a kind of clay (q. v.), and derives its colour from carbon, which it contains. It is found in primitive mountains, in Spain, France, Italy, &c., also in the coal formation in Scotland.—**BRIANCON CHALK** and **FRENCH CHALK** are popular names for Soapstone (q. v.).—**RED CHALK** is *Ochry Red Clay-iron-ore*, consisting of clay and much peroxide of iron. It is of a brownish-red colour, and a somewhat slaty structure, the cross fracture earthy. The coarser varieties are used chiefly by carpenters for making marks on wood; the finer, by painters. It occurs in thin beds in clay-slate and grauwacke-slate in some parts of Germany.

744

**CHALK-BEDS.** See CRETACEOUS GROUP.

**CHALKING THE DOOR**, a mode of warning tenants to remove from burghal tenements, long known and still in use in Scotland. The practice is thus described by Mr Hunter in his valuable work on *Landlord and Tenant*: ‘A burgh-officer, in presence of witnesses, chalks the most patent door forty days before Whitsunday, which is held to be a legal warning. There is no execution at the parish church, but the officer makes out an execution of ‘chalking’ in which his name must be inserted, and which must be subscribed by himself and two witnesses. This ceremony now proceeds simply on the verbal order of the proprietor, but anciently the interposition of a judge was requisite. In such a case, authority was given by one of the magistrates to the burgh-officer.’ That judicial authority is still assumed to lie at the root of the proceeding, is apparent from the fact, that the execution bears that the warning has been executed in her Majesty’s name and authority, and that of the magistrates of the burgh. The officer ought to notify to the tenant the object of his visit, though it is not perhaps indispensable that he should do so. The execution of chalking is a warrant under which decree of removal will be pronounced by the burgh-court, in virtue of which the tenant may be ejected on the expiration of a charge of six days. See EJECTMENT.

**CHALKY ISLAND**, in New Zealand, near the south-west extremity of Middle Island, about lat. 46° S., and long. 166° 20' E. It takes its name from being composed of a mass of white limestone, and imparts the same to the adjacent bay of 16 miles in length, and also to one of the harbours of the inlet.

**CHALLENGE.** See DUEL.

**CHALLENGE.** See JURY.

**CHALMERS, GEORGE**, an eminent historical antiquary, was born at Fochabers, Morayshire, Scotland, in 1742. Having attended King’s College, Aberdeen, and afterwards studied law at Edinburgh, he went in 1763 to North America, where he practised as a lawyer till the breaking out of the war of independence. Being a keen loyalist, he returned to Britain, where he was appointed clerk to the Board of Trade in 1786. The duties of this office he continued to discharge with diligence and ability till his death in 1825. Before his appointment, he had distinguished himself by various publications in political economy; and for some time after he devoted himself chiefly to editing the works of various authors and writing biographies. His great work is his *Caledonia; an Account, Historical and Topographical, of North Britain*; a production displaying profound research into the history of Scotland, and abounding in varied erudition. It was intended to be completed in 4 vols. 4to. The first volume, containing the historical part, appeared in 1807; of the other three, which were destined to give an account of the several counties, the second, embracing Roxburghshire, Berwickshire, Haddingtonshire, Edinburghshire, Linlithgowshire, Peeblesshire, and Selkirkshire, appeared in 1810; the third, containing the counties of Dumfries, Kirkcudbright, Wigton, Ayr, Lanark, Renfrew, and Dumbarton, appeared in 1824. A fourth volume is understood to have been left at his death, ready for the press.

Among his other publications are: *Political Annals of the United Colonies* (Lond. 1790); *On the Comparative Strength of Great Britain, during the present and the four preceding Reigns* (Lond. 1782, 1786, 1794, 1802, 1812); *A Collection of Treaties between Great Britain and other Powers* (2 vols., Lond. 1790); *Life of Daniel Defoe* (Lond. 1786);

*Life of Thomas Ruddiman* (1794); *Life of Mary Queen of Scots* (Lond. 1818); editions of the works of Allan Ramsay (1800), and of Sir David Lindsay (1806), with memoirs; also various pamphlets apologising for those, himself included, who had believed in the authenticity of the Shakespeare manuscripts forged by Mr Ireland.

CHALMERS, THOMAS, D.D., LL.D., was born at Anstruther, in Fifeshire, 17th March 1780, educated at the university of St Andrews, and in his 19th year licensed to preach the gospel. In 1803 he was ordained minister of the parish of Kilmany, in Fifeshire, about 9 miles from St Andrews. At this period, his attention was entirely absorbed by mathematics and natural philosophy, to the neglect of the studies appertaining to his profession. To gratify his love of scientific pursuits, he even formed mathematical and chemistry classes in St Andrews during the winter of 1803—1804, and by his wonderful enthusiasm and lucidity of exposition excited intense interest, and obtained for himself a great reputation. In 1808 he published an *Inquiry into the Extent and Stability of National Resources*, which proved his capacity for dealing with questions of political economy. Shortly after this, certain domestic calamities, and a severe illness of his own, opened up the fountains of his soul, and rendered him keenly susceptible to religious impressions. Having to prepare an article on Christianity for Brewster's *Edinburgh Encyclopedia*, he commenced an extensive study of the evidences, and rose from his investigations convinced that Christianity was a fact, and the Bible the veritable 'word of God.' Then the great genius of the man broke forth like sunshine. He grew earnest, eloquent, devout, and faithful to his pastoral duties. In July 1815, he was translated to the Tron Church and parish, Glasgow, where his magnificent oratory took the city by storm. His *Astronomical Discourses* were probably the most sublimely intellectual and imaginative that had ever been preached in a Scottish pulpit. They were published in 1817, and had a prodigious popularity. During the same year he visited London, where his preaching excited as great a sensation as at home. But C.'s energies could not be exhausted by mere oratory. Discovering that his parish was in a state of great ignorance and immorality, he began to devise a scheme for overtaking and checking the alarming evil. It seemed to him that the only means by which this could be accomplished was by 'revivifying, remodelling, and extending the old parochial economy of Scotland,' which had proved so fruitful of good in the rural parishes. In order to wrestle more closely with the ignorance and vice of Glasgow, C. in 1819, became minister of St John's parish, 'the population of which was made up principally of weavers, labourers, factory-workers, and other operatives.' 'Of its 2000 families,' says Dr Hanna, 'more than 800 had no connection with any Christian church, while the number of its uneducated children was countless.' We have not space to narrate at length how vast and successful were the labours of Chalmers. It is sufficient to say, that in pursuance of his favourite plan, he broke up his parish into 25 districts, each of which he placed under separate management, and established two week-day schools, and between 40 and 50 local Sabbath schools, for the instruction of the children of the 'poorer and neglected classes,' more than 1000 of whom attended. In a multitude of other ways he sought to elevate and purify the lives of his parishioners. While in Glasgow, C. had matured his opinions relative to the best method of providing for the poor. He disliked the English system of a 'compulsory assessment,' and preferred the old Scotch method of

voluntary contributions at the church-door, administered by elders. The management of the poor in the parish of St John's was intrusted to his care by the authorities, as an experiment, and in four years he reduced the pauper expenditure from £1400 to £280 per annum.

But such Herculean toils began to undermine his constitution, and in 1823 he accepted the offer of the Moral Philosophy chair in St Andrews, where he wrote his treatise on the *Use and Abuse of Literary and Ecclesiastical Endowments* (1827). In the following year, he was transferred to the chair of Theology in Edinburgh, and in 1832 published a work on political economy. In 1833 appeared his Bridgewater treatise, *On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man*. It was received with great favour, and obtained for the author many literary honours; the Royal Society of Edinburgh electing him a fellow, and the French Institute a corresponding member, while the University of Oxford conferred on him the degree of D.C.L. In 1834, he was appointed convener of the Church-extension Committee; and after seven years of enthusiastic labour, announced that upwards of £300,000 had been collected from the nation, and 220 new churches built. Meanwhile, however, troubles were springing up in the bosom of the church itself. The Evangelical party had become predominant in the General Assembly, and came forward as the vindicators of popular rights; the struggles in regard to patronage between them and the 'Moderate' or 'Erastian' party became keener and more frequent, until the decision of the civil courts in the famous 'Auchterarder and Strathbogie' cases brought matters to a crisis; and on the 18th of May 1843, C., followed by 470 clergymen, left the church of his fathers, rather than sacrifice those principles which he believed essential to the purity, honour, and independence of the church. See articles DISRUPTION and FREE CHURCH. The rapid formation and organisation of the Free Church were greatly owing to his indefatigable exertions, in consequence of which he was elected Principal of the Free Church College, and spent the close of his life in the zealous performance of his learned duties, and in perfecting his *Institutes of Theology*. He died suddenly at Morningside, Edinburgh, May 30, 1847.

This is not the place for a criticism on the works of C., which extend to more than 30 vols. It is sufficient to say, that they contain valuable and, in some cases, original contributions to the sciences of natural theology, Christian apologetics, and political economy; while on minor topics, such as the church-establishment question, they exhibit both novelty and ingenuity of argument. As an orator, C. was unique and unrivalled. We read of men, in the history of the Christian church, whom we can believe to have been as eloquent, impassioned, and earnest, but nowhere do we encounter a man in whom intellect, feeling, and imagination were so harmoniously combined—a nature so 'nobly planned, to warn, to comfort, and command.' Scotland never produced a greater or more lovable soul, one more gentle, guileless, genial-hearted, or yet more fervid, from the strength of a resolute and irresistible will, before whose impetus difficulties were dashed aside as by a torrent. There have been some loftier and more purely original minds in Scotland than C.'s, but there has never been a truer one, nor a heart whose Christian faith and piety were more intense, sincere, and humane.

CHALON-SUR-SAÔNE, a town of France, in the department of Saône-et-Loire, about 33 miles north of Mâcon. It is situated on the right bank of the

Saône, at the point where that river is joined by the Canal-du-Centre, which unites the Saône with the Loire, and secures C. an extensive traffic with the central districts of France, as well as with the Mediterranean and Atlantic. The town is generally well built, good quays line the river, along which also the finest houses extend. Vineyards, wood, meadows, and cultivated fields surround and add variety and beauty to the situation. Its manufactures include hats, hosiery, vinegar, oil, pottery, jewellery, and imitation pearls; and it has a large trade in the agricultural and other produce of the district. Steam-boats navigate the Saône from C. downwards. Pop. (1872) 18,851. C. occupies the site of the ancient *Cabillonum* or *Caballum*.

**CHALONS-SUR-MARNE**, a town of France, in the department of Marne, 107 miles east of Paris by railway. It stands on the right bank of the river Marne, which is here crossed by a handsome stone bridge. C. is old; and the houses consist chiefly of timber, lath, and plaster. The situation, however, is agreeable, and the town contains some fine public buildings, the principal of which is the cathedral, in the sanctuary of which there is one of the finest grand altars in France. On the east side of the town there is the splendid *Promenade du Jard*, or park, which covers 19 acres. C. has manufactures of woollen, cotton, leather, &c., and a considerable trade in grain, hemp, rape-seed oil, and Champagne wine. Pop. (1872) 15,186. Previous to the union of Champagne with France in 1284, the population numbered about 60,000. In 1856, the emperor formed the celebrated camp of C., to the north-east of the town, which was occupied during the Franco-Prussian war by Canrobert, and afterwards by MacMahon. On the night of August 21, 1870, MacMahon withdrew his troops; and next day the town was occupied by the Germans.

**CHALYBÆUS**, a genus of birds very closely allied to the Baritahs (q. v.), but having a rather thicker bill, and the nostrils pierced in a broad membranous space. The species are natives of New Guinea, and are birds of the most beautiful plumage, remarkable for the brilliancy of their metallic tints, and particularly for the resemblance to burnished steel, to which they owe their name (Gr. *chalys*, *yoos*, steel). On this account, they are sometimes included under the name of Birds of Paradise; and the skin of *C. paradiseus*, deprived of its feet, is sold as that of a Bird of Paradise.

**CHALYBÆUS**, HEINRICH MORITZ, a German philosopher, was born 3d July 1796, at Pfaffroda in Saxony, and educated at Leipzig. After spending some years in teaching, he was appointed in 1839 professor of philosophy in the university of Kiel, where he remained till his death in 1862. His chief works are the *Historische Entwicklung der speculativen Philosophie von Kant bis Hegel* (1836—English translations by Ederheim and Tulk); *System der speculativen Ethik* (1850); *Philosophie und Christentum* (1853); and *Fundamentalphilosophie* (1861).

**CHALYBEATE** WATERS are those which contain a considerable proportion of iron in solution. They are of two kinds, *Carbonated* and *Sulphated*. The *Carbonated* C. W. contain carbonate of iron ( $\text{FeO.CO}_2$ ) dissolved in excess of carbonic acid, and may be recognised by forming an ochre deposit of red oxide of iron ( $\text{Fe}_2\text{O}_3$ ) on the surface of the stones near the mouths of the springs, owing to the escape of the carbonic acid on exposure to the air. Ilalington Spa near London, Tunbridge Wells, and Oddy's Saline C. W. at Harrogate, are examples of this class. Where an excess of carbonic acid is present, communicating a sparkling aspect to the water and an acidulous taste, as at Pyrmont, and other places,

the term *acidulo-chalybeate* or *acidulo-ferruginous* is applied. The *Sulphated* C. W. contain sulphate of iron ( $\text{FeO.SO}_4$ ) dissolved in them, and examples of this class are afforded at the Isle of Wight (the Sand Rock Spring), Vicars Bridge, Moffat, &c. C. W. are characterised by a more or less inky or styptic taste; by becoming of a purplish black tint when infusion of galls or tea, and some varieties of wine, are added; and by giving a pale-blue colour on the addition of a few drops of ferrocyanide of potassium (yellow prussiate of potash). C. W. are of great service in cases of debility, and the *acidulo-carbonated* kind being lighter on the stomach, is generally preferred; but all C. W. are to be avoided in plethoric, febrile, and inflammatory conditions of the system.

**CHA'MA**, a genus of lamellibranchiate mollusks. The shell consists of two unequal valves, having two hinge-teeth in the one valve, and one in the other. The general form of the shell approaches to orbicular. The shell is generally thick, and is foliated with leaf-like projections, which arise in a somewhat regular manner from its surface; these and the colours of some of the species combining to make them very beautiful. The shells of the *Chama* are often called *Clams* or *Clasp-shells*, a name which they share with some of the *Periceras*, *Spondyli*, &c. They are found only in the seas of warm climates, none further north than the Mediterranean. The Linnean genus C. contained many species now removed to other families, but the restricted genus C. is the type of a family *Chamidae*. Thirty fossil species have been referred to C., four from the Cretaceous period, and twenty-six from the Tertiary.

**CHAMA'DE**. See PARLEY.

**CHAMÆROPS**, a genus of palms, with fan-shaped leaves, less exclusively tropical than palms are in general, and of which one species, *C. humilis*, is the only palm truly indigenous to Europe. It

Chamærops Humilis.

extends as far north as to the neighbourhood of Nice. It is sometimes called the PALMETTO. The flowers are in spathes about 6–8 inches long; the fruit is a triple blackish spongy drupe, which is eaten, as are also the young shoots. This palm is so tolerant of a cold climate, that a specimen has lived in the open air in the Botanic Garden of Edinburgh for more than forty years, with the protection of matting in winter. In its native regions, the leaves are much

## CHAMALARI—CHAMBER OF COMMERCE.

used for thatching, and for making brooms, hats, chair-bottoms, &c. They abound in an excellent fibre, which the Arabs mix with camel's hair, and make into tent covers: cordage, and sometimes sailcloth, are made of it in Spain; it is imported into France, and used for making carpets, under the name of *African Hair*. The French in Algeria make paper and pasteboard of it; and it is supposed that it may prove a valuable commercial commodity, as a material for paper-making.—Other species of the genus abundant in India, China, &c., serve similar purposes, and deserve attention in connection with paper.—To this genus belongs also the West Indian palm, which yields the material for chip-hats (see BRAZILIAN GRASS); and the Palmetto (q. v.) of North America is by some botanists referred to it.

**CHAMALARI**, a peak of the Himalaya between Tibet and Bhotan, in lat.  $28^{\circ} 4' N.$ , and long.  $90^{\circ} E.$ , said to have an elevation of 27,200 feet, or more than 5 miles and a furlong.

**CHAMBER**, of a piece of artillery, or small arm, is a contracted part of the bore, at the breech end. The C. contains the charge of powder, but is too small to contain the shot or shell. Some of these cavities are spherical, some cylindrical, some conical with a hemispherical termination, and some pear-shaped. Carronades and shell-guns are usually chambered. The charge just fits the C., and the ball or shell comes in contact with it. Chambered guns are more slow to load and fire than those which are not chambered; and therefore the adoption of this form depends very much on the kind of service in which the weapon is to be employed. Its primary use is in kinds of ordnance in which the charge is small compared with the calibre, and in which, consequently, there would be great loss of power unless the charge were confined within a comparatively limited space at the time of the explosion.

**CHAMBER-COUNSEL**, a barrister or advocate who gives opinions in his own chambers, but does not, or rarely does, plead in court.

**CHAMBER OF COMMERCE**, a body of merchants and traders, associated for the purpose of promoting the interests of its own members, of the town or district to which the society belongs, and of the community generally, in so far as these have reference to trade and merchandise. Of the means by which these objects are sought to be accomplished, the following may be mentioned as the most prominent: 1. By representing and urging on the legislature the views of their members in mercantile affairs; 2. By aiding in the preparation of legislative measures having reference to trade, such, for example, as the Bankrupt Acts; 3. By collecting statistics bearing upon the staple trade of the district; 4. In some places, by acting as a sort of court of arbitration in mercantile questions; 5. By attaining by combination advantages in trade which might be beyond the reach of individual enterprise.

These institutions are of continental origin, and, like so many others which England has borrowed from that source, were first introduced into Scotland. The oldest C. of C. in France is that of Marseille, which dates from the end of the 14th or commencement of the 15th century. This chamber was invested with very remarkable powers. It shared in the municipal jurisdiction, and in the administration of justice in mercantile questions. It was several times suppressed and re-established, and it was not till 1650 that its powers were fixed, and that it received its ultimate organisation. The second chamber in France was that of Dunkerque, which was established in 1700. The same year a council-general of commerce was instituted at Paris,

which, in addition to six councillors of state, consisted of twelve merchants or traders, delegated by the principal commercial towns of the kingdom, an arrangement which led within the next few years to the formation of chambers of commerce everywhere in France. We thus find that the chamber at Lyon was instituted in 1702, those of Rouen and Toulouse in 1703, of Montpellier in 1704, of Bordeaux in 1705, &c. By an order of council of Aug. 30, 1702, a direct relation was established between these various chambers and the central Council of Commerce. These chambers were all suppressed by a decree of the National Assembly in 1791, but they were re-established by a consular edict in 1802, which fixed the population of the towns in which they might be established, and the number of their members, who were to be chosen from amongst the merchants who had carried on trade in person for a period of not less than ten years. Sixty of the best known merchants, presided over by the prefect or the maire, were charged to elect the members of these new chambers. They then presented to the government two candidates for the office of member of the general council of commerce, instituted at Paris under the Minister of the Interior. This organisation was again modified in 1832, and still later by the ordonnances of September 1851 and August 1852, by which these bodies are now regulated. In accordance with that decree, the members of these bodies are now elected by the chief merchants of each town chosen for that purpose by the prefect. Their number cannot be less than 2, nor more than 21. They hold office for six years, one-third of their number being renewed every two years, but the members resigning being re-eligible. The functions now assigned to these chambers in France are—to give to the government advice and information on industrial and commercial subjects; to suggest the means of increasing the industry and commerce of their respective districts, or of improving commercial legislation and taxation; to suggest the execution of works requisite for the public service, or which may tend to the increase of trade or commerce, such as the construction of harbours, the deepening of rivers, the formation of railways, and the like. On these and similar subjects, the advice of the chambers, when not volunteered, is demanded by the government. In most of the other countries of continental Europe there are similar institutions for the purpose of conveying information and advice to the central government, and making it acquainted with local feelings and interests in commercial matters.

The oldest C. of C. in Great Britain is believed to be that of Glasgow, which was instituted 1st January 1783, and obtained a royal charter, which was registered at Edinburgh on the 31st of the same month. That of Edinburgh was instituted in 1785, and incorporated by royal charter in 1786. The Edinburgh C. of C. was the first public body which petitioned for the abolition of the Corn Laws, and the adoption of free-trade principles; and stood almost alone in the United Kingdom in advocating the Suez Canal project. It also originated the movement that government should undertake the telegraph service in connection with the Post-office. Six hundred of the bankers, merchants, and ship-owners of Edinburgh and Leith constitute the Chamber. The Manchester Chamber, since so famous for its exertions in the cause of free-trade, was not established till 1820, and for many years it continued to be the only institution of the kind in England. Its members, in 1873, numbered 400. In Hull there has been a C. of C. since 1837, but those of Liverpool, Leeds, and Bradford, notwithstanding the great trading and manufacturing

## CHAMBERLAIN—CHAMBERS.

interests of these towns, were not established till 1850, in which year, strangely enough, a similar institution was established in South Australia. The Liverpool C. of C. numbers nearly 600. The annual income of the Manchester chamber is upwards of £600, that of Liverpool about £300, contributed entirely by the subscriptions of members, amounting generally to £1, 1s. a year. In 1860, there was established in this country an 'Association of Chambers of Commerce of the United Kingdom.' In Canada, there is a Dominion Board of Trade, which is composed of the Chambers of Commerce, or Boards of Trade, as they are differently called, of a dozen of the most important cities of the Dominion. Its second annual meeting was held at Ottawa in 1872.

**CHA'MBERLAIN**, Lord, or King's C., as he was formerly called, has been one of the principal officers of state from very early times, and for centuries he was an influential member of the government. He has the function of endorsing the king's answer on petitions presented to him, and very often of communicating his majesty's pleasure to parliament and to the council. He was always a member of the council himself, *ex officio*. Though he has long ceased to have any share in the responsibilities of government, the C. is still an officer of very high standing in the royal household. He has control over all the officers and servants of the royal chambers, except those of the bedchamber, over the establishment attached to the Chapel Royal, the physicians, surgeons, and apothecaries of the household. The C. has further the oversight of the Queen's musicians, comedians, trumpeters, messengers &c.; and all tradesmen and artificers in her service are appointed by him. When the office of Keeper of the Great Wardrobe was abolished in 1782, the duties of providing the state-robcs of the royal family, the household, and officers of state, devolved on the lord chamberlain. All theatres in towns in which a royal palace is situated, require to be licensed by the Lord C., and no new play can be performed anywhere without his licence. All persons desiring to be presented at levees or drawing-rooms, require to send their cards to the Lord C., and it is his duty to see that the persons thus applying are entitled by station and character to be presented to the Queen. The C. also issues her Majesty's invitations to balls, parties, &c. In accordance with ancient custom, the Lord C. is still a member of the Privy Council. His salary is £2000 a year, but his tenure of office depends on that of the political party to which he belongs.

The Vice-chamberlain is the deputy and assistant of the Lord C., and in his absence exercises the full authority which belongs to his principal. His office existed in the time of Richard II. He is also dependent on the administration, and is usually a member of the Privy Council. His salary is £924 per annum.

**CHAMBERLAIN**, THE LORD GREAT, is a hereditary officer of great antiquity, and formerly of great importance. He has the government of the palace at Westminster, and, upon solemn occasions, the keys of Westminster Hall and of the Court of Requests are delivered to him. At these times, the Gentleman Usher of the Black Rod, the Yeoman Usher, and the door-keepers, are under his orders. At coronations, state trials, banquets, and the like, the fitting-up of the Hall devolves on him. When the Queen goes to parliament, he delivers the sword of state to any member of the administration whom he chooses, to be borne before her Majesty, he himself walking on her right hand. During the sitting of parliament, he has charge of the House of

Lords, and issues tickets of admission on the opening or prorogation of parliament. Some fees and perquisites belong to him. This office, conferred by Henry I on Alberic de Vere, was inherited by female succession from the De Veres, Earls of Oxford, by the Berties, and is now held conjointly by Lady Willoughby de Eresby and the Marquis of Cholmondeley, in right of their mothers, sisters and co-heirs of Robert, fourth Duke of Ancaster. They discharge the duties alternately in each succeeding reign, a lady acting by deputy. Lord Aveland is at present deputy Great Chamberlain.

**CHAMBERS**, EPHRAIM, the compiler of the first English encyclopedia. He was born at Kendal in the latter part of the 17th c., and began life as an apprentice to a globe-maker in London, where he conceived the idea of his encyclopaedia. The first edition of the work, in 2 vols., folio, appeared in 1728; ten years later, the 2d appeared; and in the year following, the 3d. The 4th was issued in 1741, a year after the editor's death. A 5th appeared in 1746, and a 6th, with new matter, in 1750. This work forms the basis of Dr Rees's Cyclopaedia in 45 quarto vols., and may be considered as the forerunner of the now countless publications of an encyclopedic character (see ENCYCLOPEDIA).

**CHAMBERS**, WILLIAM and ROBERT, the editors and publishers of this *Encyclopaedia* and other works; born at Peebles, W. in 1800, R. in 1802. Bearing up against the difficulties of his early life, W. C. began business as a bookseller in Edinburgh, 1819; afterwards adding printing to his business. Between 1825 and 1830, he wrote the *Gazetteer of Scotland*, 1 vol.; and the *Book of Scotland*, 1 vol. R. C. also began business as a bookseller in Edinburgh, and from 1823 to 1830 wrote successively the *Traditions of Edinburgh*, 2 vols.; *Popular Rhymes of Scotland*, 1 vol.; *Picture of Scotland*, 2 vols.; and *Histories of Rebellions in Scotland, and Life of James I.*, 5 vols. Next, he edited *Scottish Ballads and Songs*, 3 vols.; and *Biography of Distinguished Scotchmen*, 4 vols. His *Traditions of Edinburgh* procured him the friendship of Sir Walter Scott, who contributed various memoranda for the work. W. C. projected *Chamber's Edinburgh Journal*, and that periodical was commenced on the 4th of February 1832, about six weeks in advance of the *Penny Magazine*, and may be considered the pioneer of that class of cheap and popular periodicals of a wholesale kind now so generally diffused. The success of the *Journal* was materially promoted by the essays, moral and humorous, of R. C., who from the first was an able collaborateur. United from this period in the peculiar profession of writing, editing, printing, and publishing, W. and R. C. issued a series of works designed for popular instruction, including the *Journal* (now amounting, in its different series, to 60 vols.). Among these works are *Chamber's Information for the People*, 2 vols.; *Chamber's Educational Course*, 150 vols.; *Cyclopaedia of English Literature*, 2 vols.; *Miscellany of Useful and Entertaining Tracts*, 20 vols.; *Papers for the People*, 12 vols.; and the present *Encyclopaedia*, 10 vols. In conducting these laborious undertakings, they necessarily depended on a number of accomplished literary assistants. In 1849, W. C. acquired the estate of Glenormiston in Peeblesshire, and a few years afterwards he founded and endowed an *Institution* in his native town for purposes of social improvement (see PEEBLES). His later productions are—*Things as they are in America*, 1 vol., the result of a visit to the United States in 1853; the *Youth's Companion and Counsellor*, 1 vol.; *History of Peeblesshire*, 1 vol. 8vo

(1864); pamphlets on *Improved Dwellings and Co-operation among the Working Classes*; *Wintering at Mentone*, written from personal knowledge of the place during two successive visits; *France: its History and Revolutions*, 1 vol. (1871); *Memoir of Robert Chambers, with Autobiographic Reminiscences*, 1 vol., and *Alice Gilroy*, a Scottish story, 1 vol. (1872). Twice elected Lord Provost of Edinburgh, W. C. occupied that office for four years (1866–1869), during which he promoted several important public acts, including one for the improvement of the older part of the city. R. C. latterly wrote a work on *Ancient Sea Margins*; after which appeared his *Domestic Annals of Scotland*, 3 vols. He also edited the *Life and Works of Robert Burns*, 4 vols. A collection of his historical and miscellaneous papers was issued under the title of *Select Writings of Robert Chambers*, 7 vols. His latest production was the *Book of Days*, a most elaborate and exhaustive work in two large volumes, the preparation of which so injured his health, that he relinquished all further literary exertion. In 1863, he received from the university of St Andrews the honorary distinction of LL.D. R. C. died at St Andrews 17th March 1871, leaving a high character for literary application, integrity, and geniality of disposition. In 1872, W. C. received the honorary distinction of LL.D. from the university of Edinburgh. Engaged in miscellaneous literary labour, he remains head of the firm of W. and R. C., which owns an extensive printing and publishing establishment in Edinburgh, and a publishing establishment in London. The whole of the works issued by W. and R. C. aim at popular instruction, free of all political or sectarian bias. Perhaps their greatest effort in these respects has been the present *Encyclopædia*.

**CHAMBERS, PRACTICE BEFORE A JUDGE OR VICE-CHANCELLOR AT.** It is to applications to the court in *banc* alone that the name of motions is properly given. But there are certain matters of subordinate importance, regarding which applications are made to a single judge at chambers, who decides in a summary way on the pleadings.

**CHAMBERY**, a town of Savoy, of which it is the capital, beautifully situated in a rich vine-clad valley, between two ridges of hills, about 45 miles west-south-west of Geneva. Though situated at an elevation of nearly 1000 feet above the sea, the climate of C. is mild; the scenery around, with the river Leyse flowing through the valley, is exceedingly fine. The town itself, however, is dull and uninteresting. Some towers and other fragments of the old castle of the Dukes of Savoy, which dates from the 13th c., still remain. C. is celebrated for its manufacture of silk-gauze. It has also manufactures of soap, leather, hats, lace, and a trade in metals and wines. Pop. (1872) 13,417. St Réal and Comte Xavier le Maistre were natives of Chambery. From the middle of the 16th c. to the peace of Utrecht, 1713, C. was under the dominion of France; and again from the Revolution to the Congress of Vienna, 1815, when it was restored to the House of Savoy; but in 1860, by the cession of Savoy, it has again come under the rule of France.

**CHAMBORD**, a celebrated royal castle of France, in the department of Loir-et-Cher, situated in the midst of a vast walled park 21 miles in circumference, about 12 miles east of Blois. Its foundation was laid in 1526, by Francis I., who employed 1800 men constantly in its erection until his death. The work was continued with less zeal by his successors, Henri II., Henri III., Charles IX.; and Louis XIV. and Louis XV. also made some additions to it. The building, which marks the transition between the fortified castle and Italian palace, is

surmounted by a vast number of turrets, minarets, and cones; its most prominent features, however, being six enormous round towers, each 60 feet in diameter. The double spiral staircase in the central tower is of great architectural interest, being so contrived that parties pass up and down without meeting each other. The castle has no less than 440 chambers. C. was the scene of the gallantries of Francis I. Here Henri II., Louis XIII., and Louis XIV. resided; and at one of the brilliant fêtes given at the castle by the latter, Molière performed, for the first time, his play of the *Bourgeois Gentilhomme*. Among the other occupants of C. were Marshal Saxe, Stanislaus, king of Poland, and Marshal Berthier, upon whom it was bestowed by Napoleon I. After his death, it was purchased from his widow by a number of legitimists, and presented to the Duc de Bordeaux.

**CHAMBORD (HENRI CHARLES FERDINAND MARIE DIEUDONNÉ D'AETONIS, DUC DE BORDEAUX)**, COMTE DE, the representative of the elder branch of the House of Bourbon, and of its claims to the French throne, was born in Paris, September 29, 1820. He is the grandson of Charles X., and the son of the Duke of Berri, who was murdered by Louvel, February 14, 1820. The Duke of Angoulême, Charles X.'s eldest son, being childless, the Duke of Berri was heir-presumptive; and as, at his death, he left only a daughter, the joy was great when, seven months after, his widow gave birth to a prince, who received the title of Duke of Bordeaux—that of Comte de C., by which he has latterly been known, being derived from the Castle of C. (q. v.), presented to him at his baptism. He was baptized amid circumstances of great pomp with water brought by M. de Châteaubriand from the river Jordan, and received the appellation of *l'Enfant du Miracle* ('the Miraculous Child'). When Charles X. abdicated the crown at the revolution in 1830, he did so in favour of his grandson, the Duke of Bordeaux. The people, however, insisted on the 'Citizen King,' and the elder Bourbons were banished. On the death of Charles X., the Duke of Angoulême assumed the title of Louis XIX., and another party proclaimed the Duke of Bordeaux king; but at last a reconciliation was brought about by Prince Metternich. In 1839, the prince visited Italy, accompanied by his mother, and was received by the petty courts with great distinction. After the death of the Duke of Angoulême in 1844, the heads of the different fractions of legitimists met to pay their united homage, and the Duke of Bordeaux made a 'pilgrimage to Belgrave Square' to receive it. In 1846, he married the eldest daughter of the Duke of Modena, who had never acknowledged the monarchy of July. After the revolution of 1848, many legitimists were returned to the National Assembly. In 1850, the Duke of Bordeaux, or Count of C. as he styled himself, appeared at Wiesbaden, where a congress of his adherents assembled to consult as to their future policy. As the Count of C. is without heirs, a union, or 'fusion,' as it is called, of the partisans of the elder Bourbons with the Orleanists was effected, but no attempt made to carry out the arrangement. After the capitulation of Paris in 1871, the Count of C. returned to France, and, under the title of Henry V., issued a proclamation, in which he promised, if placed by the nation at the head of its affairs, to maintain the temporal power of the pope. Neither this nor subsequent manifestoes have (1875) induced the French people to accept of him as their king.

**CHAMBRE ARDENTE** ('the Fiery Chamber'), a name given at different times in France to an

extraordinary court of justice, probably on account of the severity of the punishments which it awarded, the most common being that of death by fire. In the year 1535, Francis I established an Inquisitorial Tribunal, and a Chambre Ardente. Both were intended for the extirpation of heresy. The former, of which the pope was a corresponding member, searched out, by means of spies, cases of heresy, and instructed the processes; while the latter both pronounced and executed the final judgment. Under Henri II., the activity of the C. A. received a new impulse, the entrance of that monarch into Paris on the 4th July 1549 being signalled by the burning of several heretics. But Francis himself, gallant and gay, as courtly history represents him, also seemed to relish a spectacle of this kind, for on various occasions he and his mistress presided at a burning. By and by, the C. A. relaxed in its penalties, and a cry was got up among the more bigoted Roman Catholics that it was conniving at heresy. This seems to have roused the 'lurking devil' in its members, and in order to wipe away the reproach, they commenced a series of unheard-of cruelties, which, along with other events, contributed to originate the religious war of 1560. In 1679, Louis XIV. employed it for a new and more praiseworthy purpose—viz., to investigate the numerous reports of poisoning cases which the trial of the Marchioness Brinvilliers (q. v.) caused to be circulated. Many persons of the first rank, such as the Maréchal de Luxembourg, and the Princess Louise of Savoy, were examined on suspicion, but no one was executed except the pretended sorcerer, Voisin (1680), after whose time the C. A. ended its activity.

**CHAMELEON**, a southern constellation within the antarctic polar circle, and containing nine stars.

**CHAMELEON** (*Chamæleo*), a genus of saurian reptiles, constituting a distinct family, of very peculiar form and structure, and on various accounts highly interesting. The body is much compressed; the dorsal line sharp, in some of the species rising into an elevated crest; the back of the head is also elevated into a sort of cone. The neck is very short, and does not admit of the head being turned, for which, however, compensation is found in the remarkable powers of motion possessed by the large prominent eyes, which move independently of one another, and are covered with a membrane pierced only with a small hole for the pupil to look through. There are no external ears. The skin is not covered with scales, but, like shagreen, rough with granules. The legs raise the body rather higher than in most of the saurians; the toes, both of the fore and hind feet, are divided into two sets, one directed forward, and the other backward, so that each foot has the power of grasping like a hand. The tail is long and prehensile. The lungs are very large, and are connected with air-cells that lie among the muscles and beneath the skin, so that the animal has a remarkable power of inflating itself with air. The tongue is remarkably extensible, and is the organ by which the animal seizes the insects which constitute its food, being darted at them with unerring aim, whilst a viscous saliva causes them to adhere to it, and they are carried with it into the mouth. Chameleons are slow in their movements, except those of the eyes and tongue, and remain long fixed in one spot, awaiting the approach of insects, which they seize on their coming within reach. They all live among the branches of trees. Their power of fasting is great, and along with their gulping of air in respiration, and their habit of inflating themselves with air, gave rise to the

fable, current among the ancients and until recent times, of their living on air. Their celebrated power of changing colour is not equally fabulous, and perhaps it would be rash in the present state of knowledge on the subject to assert how far it has been exaggerated. It is probably in part under the control of volition, and may be used, as

Chameleon.

has been asserted, to render the animal less easy of observation, by assimilating it to the colour of surrounding objects; it may depend in part on the action of light; it is certainly connected with the fear and other passions of the creature. Milne Edwards has discovered that it depends upon the presence of two differently coloured layers of pigment in the skin.

Chameleons are natives of the warm parts of the Old World, but are most abundant in Africa. One species is found in some parts of the south of Europe, as near Cadiz. The whole number of known species is small.—When brought, as they frequently are, to Great Britain, they soon die, apparently from the coldness of the climate.

The fables which, in former times, were current regarding the C. were extremely numerous and ridiculous. It supplied not a few of those medicines to which absurd credulity ascribed the most marvellous powers.

**CHA'MFERING**. In Architecture, an angle which is slightly pared off, is said to be chamfered. The chamfer is sometimes made slightly concave, in which case it is called a hollow chamfer. Chamfers, in Gothic architecture, have frequently ornamental terminations of various kinds. The term C. is applied to wood-work as well as stone.

**CHAMIER, FREDERIC**, an English novelist, was born in London, 1796. He entered the navy as a midshipman in 1809, and distinguished himself in the American war. He left the service in 1833. The success of Marryat in depicting sea-life led C. to try the same field, in which he was not without success, though in invention and humour he falls short of his model. His best romances are—*Life of a Sailor* (3 vols., Lond. 1834), *Bon Brace* (3 vols., Lond. 1835), *The Arethusa* (3 vols., Lond. 1836), *Trevor Hastings* (3 vols., 1841), *Passion and Principle* (3 vols., 1843), *Tom Bowline* (3 vols., 1839), *Jack Adams* (3 vols., 1838), &c. All his novels have been translated into German. C. wrote a *Review of the French Revolution of 1848* (Lond. 1849), in which he gives a rather prejudiced view of some of the prominent actors. He died on the 1st of November 1870.

**CHAMISSO, ADELBERT VON**, one of the most celebrated of German lyric poets, was born in 1781,

at the castle of Boncourt, in Champagne. His parents settling in Prussia in 1790, he became a page of the queen, and entered upon a military career. But when the campaign of 1806 broke out, he returned to France, for though no admirer of Napoleon, he was unwilling to fight against his native land. At this time, he was thrown into the circle of Madame de Staél at Coppet, and there began that study of natural philosophy which he afterwards pursued at Berlin. In 1814, Count Rumjanzow, chancellor of the Russian empire, prepared an exploring expedition round the world at his own expense; C. accompanied it as naturalist. He embarked at Cronstadt under Captain Otto von Kotzebue, chief of the expedition, which, however, failed in its main object—that of discovering a north-east passage. Subsequently, he obtained a situation in the Botanical Garden of Berlin, was made a member of the Academy of Science; and after a happy domestic life, died there in 1838, universally loved and honoured. He wrote several works on natural history, but his fame rests chiefly on his poetical productions. As early as 1804—1806, he, together with Varnhagen von Ense, published a *Museen Almanach*. In 1813, he wrote his original and amusing fiction called *Peter Schlemiil*, the story of the man who loses his shadow, which has been translated into almost all the languages of Europe. The character of his poetry is wild and gloomy, and he is fond of rugged and horrible subjects. In his political songs, he succeeds well in humour and irony; nor is he deficient in deep and genuine feeling. Indeed, several of his ballads and romances are master-pieces in their way. We may instance one of his longest poems, *Salas y Gomez*, written in terza rima, as a proof how peculiarly German the cast of C.'s mind was, despite his French origin. His collected works, in six volumes, appeared at Leipzig in 1836—1839.

OHA'MOIS (*Antilope rupicapra*, Ger. *Gemse*), a species of antelope (q. v.) inhabiting the Alps and other high mountains of Central and Southern Europe, as the Pyrenees, the Carpathians, and the mountains

Chamois.

of Greece; also those of some of the Mediterranean islands, Caucasus, Taurus, and other mountains of the west of Asia. It is one of the antelopes sometimes designated *capriform* or goatlike, because of their departure from the typical or true antelope form, and approach to that of the goats. The C. is about the size of a large goat, but the neck is longer in proportion, and the body shorter; the horns seldom more than six or seven inches long, black, rising nearly straight up from the forehead,

and so bent back at the tip as to form a hook. The colour is brown, deeper in winter than in summer; the tail is black; the head is of a pale-yellow colour, with a dark-brown band along each cheek.

The usual summer resort of the C. is in the higher regions of the mountains which it inhabits, not far from the snow-line, and it is often to be seen lying on the snow. In winter, it descends to the higher forests. The aromatic and bitter plants of the mountain-pastures are its favourite food. It is—like the ruminants generally—very fond of salt; 'and many stones are met with in the Alps, hollowed out by the continual licking of the C., on account of the saltpetre with which they abound.' It is gregarious: flocks of one hundred are sometimes seen; but in the Swiss Alps, where the numbers have been much reduced by hunting, the flocks are generally very small, and often consist only of a few individuals. Old males often live solitarily. The C. produces one or two young at a birth, in the month of March or April.

It is an animal of extraordinary agility, and flocks may often be observed sporting in a remarkable manner among the rocky heights. It can leap over ravines of 16 to 18 feet wide; a wall of 14 feet high presents no obstacle to it; and it passes readily up or down precipices which almost no other quadruped could attempt. It is said to descend obliquely almost perpendicular precipices of more than 20 feet, striking its feet once or twice against the rock, as if to stay and guide its descent, and alighting securely, often on a very narrow ridge of rock, with its hind feet first, and bringing the fore feet almost into contact with them.

The hunting of the C. is an occupation attended with great hardships and much danger, but of which, nevertheless, some of the Swiss peasants become passionately fond. The hunter sometimes goes out on the adventurous chase alone; but more frequently several go out together, dividing into parties; and whilst the flock of C. flee from those whose approach they first descry, an opportunity of using the rifle is obtained by their comrades. The scent of the C. is extremely keen; and when by this sense it is apprised of the approach of the hunter, it becomes alarmed and restless until it sees him, upon which it rushes hastily in an opposite direction, and so falls into the ambuscade. When a flock of C. is feeding, one is always on the watch, and by a sort of whistle, announces apprehended danger.—The flesh of the C. is highly esteemed. Its skin is made into leather, and from it the original *shammoy*, or *shammy* leather, so much prized for softness and warmth, was obtained, although the name has now become common also to leather prepared from the skins of other animals. See SHAMMOY.—When taken young, the C. is easily tamed.—The C. of the Persian mountains is smaller and of a paler colour than the European variety, and its horns bend from the base.

CHA'MOMILE, or CA'MOMILE (*Anthemis*), a genus of plants of the natural order *Composita*, sub-order *Corymbifera*, distinguished by imbricated bracts, a scaly conical receptacle, a ray of one row of female florets, those of the disk hermaphrodite, the achænia obscurely four-cornered, and destitute of pappus. The species are annual and perennial herbaceous plants, chiefly natives of Europe and other temperate parts of the world. Several are found in Britain, amongst which is the COMMON C. (*A. nobilis*), the most important species of the genus, well known for its medicinal virtues, a perennial plant with a stem about a foot long, procumbent and much branched, each branch terminated by a flower (head of flowers) more than an inch broad, with yellow disk and white ray, the whole

plant intensely bitter and highly aromatic. Its medicinal virtues are ascribed to the essential oil which it contains, *Oil of Chamomile*, which abounds most of all in the involucra. This oil is of a greenish-yellow colour, and is used in the preparation of some medicines. The dried flowers are often administered in the form of an infusion, as a stimulant of the nerves of the abdomen, an alterative and antispasmodic; or are applied to the skin as an anodyne, and on account of their power of promoting absorption and suppuration. The infusion also acts as an emetic, and is often used to assist the action of other emetics. C. flowers find

Chamomile (*Anthemis nobilis*).

a place in the pharmacopoeia, and are also amongst the most esteemed of domestic medicines, the plant being extensively cultivated for their sake, and very generally finding a place even in cottage-gardens. Yet they ought to be used with caution, as they have been known to produce congestion in the brain, and are very apt to aggravate any malady of this kind already existing. A double-flowering variety of C. is more generally cultivated than the single, to supply the C. flowers of the shops, the flowers being whiter and more bulky, but it is otherwise rather inferior. C. is easily propagated by parting the roots. It delights in a dry and rather poor soil—The name WILD C. is given to a very similar plant, also a native of Britain (*Matricaria Chamomilla*), an annual belonging to a genus closely allied to *Anthemis*. It may readily be distinguished by the want of scales on the receptacle. Its medicinal virtues resemble those of common C., and although now disused in Britain, it is in some parts of Europe preferred for internal use, because it is less bitter, less nauseous, and generally milder and more agreeable in its operation—No small quantity of common C. is illegally used in the manufacture of beer in England, and is imported from Germany for this purpose. Yet this plant is so abundant in some parts of the south of England as to form a principal part of the pasture in sheep-walks, and to fill the whole air with its scent. The other British species of C. (*Anthemis*) are mere weeds; one of them, called Stinking C. (*A. Cotula*), is so acrid as to blister the fingers, if much handled. But the flowers of the Ox-EYE C., or DYER's C. (*A. tinctoria*), a native of many parts of the continent of Europe, yield a beautiful yellow dye, on account of which the plant is often cultivated.

782

CHAMOND, St, a town of France, in the department of Loire, situated at the confluence of the Gier and the Ban, about 7 miles north-east of St Etienne, on the railway between that place and Lyon. It is a flourishing well-built town, with extensive manufactures of ribbons and stay-laces. C. has also several silk-mills and numerous iron furnaces and foundries; and extensive coal-mines exist in the vicinity. Pop.(1872) 12,382.

CHAMORERIL, a lake of Ladakh or Middle Tibet, in lat. 32° 55' N., and long. 78° 15' E. It lies at a height of 15,000 feet above the sea, on the plateau between the upper waters of the Sutlej and of the Indus, girt by mountains which rise, at some points, 5000 feet above its own level. Though it is beyond the recognised limits of perpetual congelation, yet it freezes only in winter, and is hence supposed to be of great depth. Necessarily receiving much water from the surrounding mountains, it is without any visible outlet—evaporation alone, even at this elevation, appearing to maintain one uniform surface on a length of 15 miles, and a width of 24.

CHAMOUNI, or CHAMONIX (Lat. *Campus munitius*), is the name of a wild and romantic valley and village among the Alps in Savoy. It lies at a distance from all the high roads, at an elevation of about 3400 feet above the level of the sea, and more than 2000 feet above that of the Lake of Geneva. The valley is about 13 miles long, and about 2 broad, and is traversed by the Arve. It is bounded at the east end by the Col de Balme, over which there is a mule-path to Martigny, in the upper valley of the Rhone, and from the other end issues the road to Geneva, which lies at a distance of 53½ miles from Chamouni. On the north side lies Mont Breven and the chain of the Aiguilles Rouges, and on the south, the giant group of Mont Blanc, from which enormous glaciers or rivers of ice slide down, even in summer, almost to the bottom of the valley. The chief of these glaciers are—the Glacier des Bossoms, des Bois, d'Argentière, and du Tour. By ascending to a point called Montanvert, we come upon the upper course of a glacier, where it expands into a great mountain-lake of ice called the Mer de Glace, in which there is a solitary rock or oasis called Le Jardin, about seven acres in extent, and covered with the most beautiful herbage. The excursion to the Jardin is one of the most striking excursions within the range of Chamouni. Until 1741, the valley was almost unknown; the region was considered a wilderness, and known by the name of Les Montagnes Maudites, or 'accursed mountains.' In the above year, it was visited by two Englishmen, Pocock and Wyndham, who ascended as far as Montanvert; and a granite block there still bears the name of the Englishmen's Stone. It was only, however, in 1775 that the attention of travellers was effectually called to it by Saussure and Bourrit. The valley is rich in peculiar plants, and furnishes an aromatic and perfectly white honey. The village of C. owes its origin to the Benedictine convent founded between 1088 and 1099. The population of the village is about 2000, who depend partly upon the strangers who visit the valley, and partly upon the pastures and upon hunting. There are several good hotels, and the best guides are to be found here for the neighbouring Alps. It is from C. that Mont Blanc is usually ascended.

CHA'MPAC (*Michelia Champaca*), an Indian tree, possessing great beauty both of foliage and flowers, and much venerated both by Brahmanists and Buddhists. Images of Buddha are made of its wood. Its flowers have a pale-yellow tint, and a

## CHAMPAGNE—CHAMPION.

sweet oppressive perfume, much celebrated in the poetry of the Hindus.

**CHAMPAGNE**, formerly a province of France, now forming the departments of Seine-et-Marne, Aube, Yonne, Haute-Saone, and Ardennes. The province was about 180 miles long by 150 broad, its surface presenting extensive plains with ranges of hills, especially in the north and east. Upon these hills is grown the famous Champagne wine.

In ancient times, C. was known as a part of Gallia, was subjugated by Cesar, and afterwards was annexed to the kingdom established by the Franks. After the 11th c. it had its own dukes, who were vassals of the French kings. By the marriage of Philippe IV. with Joanna, heiress to the kingdom of Navarre, Champagne, and Brie, C., in 1284, came to the French crown, and was incorporated by Philippe VI. in 1328. During the campaign of 1792, the eastern part, and, in the campaign of 1814, the western part, of C. was the chief arena of warfare.

**CHAMPA'GNE WINE** is the produce of vineyards in the above-mentioned province of Champagne. There are white and red Champagnes; the white is either sparkling or still. Sparkling or effervescent (*mousseux*) C. is the result of a peculiar treatment during fermentation. In December, the wine is racked off, and fined with isinglass, and in March it is bottled and tightly corked. The fermentation being incomplete when the wine is bottled, the carbonic acid gas generated in a confined space dissolves in the wine, and communicates the sparkling property to Champagne. To clear the wine of sediment, the bottles are first placed in a sloping position with the necks downward, so that the sediment may be deposited in the necks of the bottles. When this sediment has been poured off, some portion of a *liqueur* (a solution of sugar-candy in cognac) is added to the wine, and every bottle is filled up with bright clarified wine, and securely re-corked. The effervescence of the wine thus prepared bursts many bottles, in some cases 10 per cent.; and in seasons of early and sudden heat, as many as 20 and 25 per cent. have been burst. Wine-buyers estimate the value of wine according to the breakage, that which breaks most bottles being considered best. Still or non-effervescent C. is first racked off in the March after the vintage. Creaming or slightly effervescent C. (*demi-mousseux*) has more alcohol, but less carbonic acid gas than sparkling Champagne.

The best varieties of this wine are produced at Rheims and Epernay, and generally on a chalky soil. Among white Champagnes of the first class, the best are those of Sillery, which are of a fine amber hue, dry spirituous, and possessing a superior bouquet; those of Ay and Mareuil are less spirituous, but are sparkling, with a pleasant bouquet. Other white wines of first class are those of Hautvilliers, Dizy, Epernay, and Pierry.

In the first class of red C., or Montagne, we have the varieties of Verzy, Verzenay, Mailly, St Basle, Bouzy, and Thierry; all having fine colour, clearness, good body, sufficient spirit, and a pleasant bouquet. The trade in Champagne wines is chiefly carried on in Rheims, Avise, Epernay, and Chalons-sur-Marne. The cellars in which the vintages are stored are cut out of the calcareous rock. The fact that the sale of C. is very extensive and lucrative, has naturally given rise to adulterations. Sugar, and the juices of pears or gooseberries, or birch-juice, &c., have been used for making spurious Champagne. It may fairly be reckoned that not even a third part of the wine sold for C. in Paris is genuine. The greater part of it is readily manufactured by

simply charging other light wines with carbonic acid gas. Recently, the German purveyors have succeeded in preparing light wines—such as Rhenish, Main, Neckar, Meissner, and Naumburg—so much like genuine C., as to deceive even the connoisseur. Altogether, it is estimated that the district produces 1,100,000 hectolitres (24,200,000 gallons) of genuine C., of which, however, the finest growths make but a small part.

**CHA'MPARTY**, or **CHA'MPERTY** (Fr. from Lat. *campi partitio*, a division of lands), an offence known to the law of England, which consists in a bargain between the plaintiff or defendant in a suit, and a third party, generally a lawyer, that the latter shall have part of the land, debt, or other thing sued for, in the event of success, and that in the meantime he shall carry on the suit at his own expense. This practice has been strictly forbidden by statute in England from very early times (3 Edward I. c. 25; 13 Edward I. c. 49; &c.); and in Scotland, the rule of the civil law by which the *pactum de quodlitis* (q. v.) was held to be a *pactum illicitum* (q. v.), and as such void, has all along been part of the common law. Such practices were also forbidden by statute to members of the College of Justice (1594, c. 216). There is this difference between the laws of the two countries, however, that whereas in England the offence has always been punished criminally, in Scotland, the only penalty which it entails beyond nullity of the bargain, is deprivation of office. In former times, the evil chiefly apprehended from C. probably was, that the honesty of judges might be tampered with by advocates who were generally their friends, and not unfrequently their very near relatives, if permitted to be personally interested in the issue of the causes in which they were professionally employed. In our own day, the chief danger consists in the encouragement which might thus be given to dishonest and oppressive litigation, and the facilities which would be afforded for nefarious transactions between the agents on the opposite sides. That practices closely analogous to C., though unnamed, are not unknown in the lower strata of the legal profession in all countries, is but too probable. The necessities of trade have further introduced considerable equitable modifications into the law of C., which will be explained under **CHOSE IN ACTION**.

**CHA'MPION** (from a Gothic root signifying to contend, fight; Ang.-Sax. *camp*, fight). In the judicial combats of the middle ages, it was allowed to women, children, and aged persons, except in cases of high treason or of parricide, to appear in the lists by a representative. Such a hired combatant was called a champion. Those who followed this profession were generally of the lowest class, and were held disreputable; for besides the perils of the combat, they were liable to be executed as well as their clients. They were obliged to wear a peculiar dress of leather, and peculiar armour, which was also held disreputable. They were not allowed to fight on horseback, and appeared in the lists with their hair and nails cut short. Champions are mentioned as early as in the time of Charlemagne; and Otto I. employed them in deciding the succession to the empire. At a later period, in the age of Chivalry, the word C. came to have a more dignified acceptation, and signified a knight who entered the lists on behalf of an injured lady, of a child, or of any one incapable of self-defence. In England, the crown even had its C., who, mounted on horseback and armed to the teeth, challenged, at every coronation at Westminster, all who should deny the king to be the lawful sovereign of the three realms. This practice is understood to have been

first introduced under Richard II., and it continues to make a part of the ceremonial of an English coronation to this day. The name of C. was also given to the knight who, during a tournament, had charge to see that no injury or insult should be offered to the assembled ladies.

**CHAMPLAIN**, a lake separating the states of New York and Vermont, and penetrating, at its north end, about six miles into Lower Canada. It empties itself into the St Lawrence, about 45 miles below Montreal, by the Sorel or Richelieu. It is navigable throughout for vessels of about 100 tons, having its communications improved by one canal on its own river, and by another to the Hudson. It stretches in lat. from 43° 30' to 45° 6' N., and in long. from 73° to 73° 30' W.; its extreme breadth, however, never exceeding 15 miles. Its principal towns are Whitehall at the south, Plattsburg on the west, and Burlington on the east. Both Lake C. and its tributary, Lake George, have been prominent in the history of the country—during the rivalry of France and England before the conquest of 1759–1760; during the revolutionary struggle of 1775–1782; and lastly, during the war of 1812–1814, between Great Britain and the United States.

**CHAMPOLLION, JEAN FRANÇOIS**, an illustrious name in modern Egyptian archeology, was born, December 23, 1790, at Figeac, in the department of Lot, France. In 1801, he was introduced to Baron Fourier, secretary to the *Institut d'Egypte*, who initiated him into the science of Egyptian antiquities. In 1807, C. went to Paris, in order to pursue, with more advantage, his oriental studies; and, in 1809, was appointed professor of history in the Lyceum of Grenoble. In 1811, he published his work, *L'Egypte sous les Pharaons*, intended as the forerunner of a more elaborate work on Egypt, of which only the geographical section appeared, in 1814. In his endeavour to decipher the Rosetta Stone, C. laboured under the error of supposing that in this inscription the hieroglyphics were wholly ideographic, and the demotic and hieratic characters wholly phonetic. Afterwards, he was led to believe that the hieratic characters were of the same nature as the hieroglyphic, and this conviction he expressed in a communication made to the *Académie des Inscriptions*, in August 1821. In the same year he published his essay, *Sur l'écriture Hébraïque des Anciens Egyptiens* (Grenoble), a work which is now scarce. In this essay he continued to assert the common ideographic nature of both hieroglyphic and hieratic characters. Meanwhile C. had been made acquainted with the conclusions of the acute mathematician, Dr Thomas Young (q. v.), respecting the phonetic use of hieroglyphic signs. Without doubt, it was this important discovery, of which Dr Young, however, made no great use, that set C. on the right track of investigation, and led to those brilliant results which were regarded by Niebuhr as constituting the greatest discovery of the century. By a comparison of the name of Ptolemy on the Rosetta Stone with that of Cleopatra on the Philæman obelisk, he was enabled to lay the foundation of an alphabet, which he continued to elaborate until it now forms the basis of modern Egyptian archaeology. His first decisive discoveries were made known in his celebrated *Lettre à Mme Dacier* (Par. 1822), which was followed by the *Précis du Système Hiéroglyphique* (Paris, 1824; second ed. 1828); but his principal work, the *Grammaire Egyptienne*, was posthumously published in 1836.

In 1824, appeared his *Panthéon Egyptien*; and, in 1825, his celebrated letters to the Duc de Blacas,

784

in which he explains the names and titles of many of the Pharaohs, written on the monuments in Drovetti's Egyptian Collection at Turin, and attempts to class them into dynasties. His theory of interpretation was much controverted at first, but its importance was recognised by such distinguished scholars as Rosellini, Bunsen, Sir William Gell, and others.

In 1828 he was appointed by Charles X. to accompany a scientific expedition to Egypt, of which the results were given by Rosellini in the *Monuments de l'Egypte et de la Nubie* (Par. 1835–1845). On his return to Paris, 1830, C. was made a member of the *Académie des Inscriptions*, &c.; and, in the following year, was appointed to the new chair of Egyptian Antiquities in the College of France; but soon after the commencement of his intended course of lectures, in May 1831, he fell ill, and died, March 4, 1832. According to Silvestre de Sacy, 'few men, since the birth of letters, have rendered to erudition services equal to those which have consecrated to immortality the name of Champollion.'

**CHAMPOLLION-FIGEAC, JEAN JACQUES**, a distinguished French archeologist, was born, 1778, at Figeac, in the department of Lot. After holding in Grenoble the offices of librarian and professor of Greek literature, he was appointed, in 1828, conservator of MSS. in the Imperial Library in Paris; but, after the February revolution, was deposed from office by Carnot. In 1842, he was appointed, by Louis Napoleon, libraria of the palace of Fontainebleau. Beside the *Antiquités de Grenoble* (1807), his chief works include the *Annales des Légendes et Egypte Ancienne* (forming a part of *L'Univers Pittoresque*); *Les Tournois du Roi René*, a splendid work, with lithographs by Motte; and several publications of old French documents. After the death of his younger and more celebrated brother, C. was employed in editing the MSS. left by that distinguished scholar, and has given an account of them in the *Notice sur les Manuscrits Autographes de Champollion le Jeune* (Par. 1842). He died May 1857.

His son, **ARMÉ CHAMPOLLION-FIGEAC**, follows the same path of historical antiquarianism, and has published several interesting useful works.

**CHANAK-KALESSI** ('Turkish, 'Pot Castle'), a town of Anatolia, deriving its name from its manufactures of crockery, is situated on the Dardanelles, about 28 miles south-west of Gallipoli. Its castle is the most important on the Dardanelles, which name is sometimes given to the town itself. Pop. some 3000 or 4000.

**CHANCE**, in its original and strict meaning, may be defined as that which determines the course of events, in the absence of law, ordinary causation, or providence. Strictly speaking, it is an idea which few would now be disposed to admit as corresponding to anything which really exists; the religious mind excluding it as inconsistent with the belief in the Divine government, and the philosophical mind rejecting it as inconsistent with a recognition of universal laws of causation. As a word, however, it has always been, and always will be popularly accepted; and its use is correct so far as we overlook, or choose for the moment to throw out of view, the more universal connection of events, and regard them as their emergence, on a superficial view, appears to be determined. The idea of C. as referring to some apparently capricious or at least inexplicable cause of an event, distinguishes it from the word probability, or the degree with which the expectation of an event approves itself to a particular mind, the first expressing what metaphysicians would call an objective, and the second a subjective idea. It is clear that C., being

## CHANCEL—CHANCELLOR.

only legitimate as an expression in popular parlance—or if admitted as a term in philosophy, one that would at once lead into the most inextricable problems—is a term which is much too indefinite to admit of any kind of measurement; while what we call probability, or the degree with which an expectation approves itself, owing to certain data presented to the mind, does, as we shall hereafter see, admit of a kind of measurement which leads to very important consequences. For these reasons, the consideration of what is sometimes called the *Doctrine of Chances*, but what is more properly the *Theory of Probabilities*, will be found under the head of PROBABILITY.

**CHA'NCEL** (Fr.; Lat. *cancellus*, a screen). The C. was, and in some churches is still, separated from the nave by a screen of lattice-work, so as to prevent general access thereto, though not to interrupt either sight or sound. As it was in this part of the C. that the service was always performed previous to the Reformation, the clergy were held to have a special right to it, in return for which its repairs in general still fall on the impropriator, rector, or vicar, and not on the parish. The chief pew in the C. belongs to the rector or impropriator, but the disposal of the seats in the church, with this exception, belongs to the ordinary, or, practically, to the churchwardens, to whom the authority of the ordinary is delegated. No monument, moreover, can be set up without the ordinary's consent. The term C. is usually confined to parish churches which have no aisles around the choir, or chapels behind it or around it; and in this case the C. and the choir have the same signification. But in larger churches there are sometimes chancels at the ends of the side aisles, and this whether the choir has the character of a choir in the larger sense, or of a chancel. See CHURCH.

**CHA'NCELLOR** (Lat. *cancellarius*). It is said that the chief notary or scribe of the Roman emperor was called C., either because he was intrusted with the power of obliterating, *cancelling*, or *crossing out* (*cancellare*, to make lattice-work) such expressions in the edicts of the prince as seemed to him to be at variance with the laws, or otherwise erroneous; or because he sat *infra cancellum*, within the lattice-work or railings (*cancelli*) which were erected to protect the emperor from the crowding of the people when he sat in judgment. Neither the title nor the office of C. is at all peculiar to England. The C. of France (Chancelier de France), from a very early time, was an officer of state of great power and dignity, under whom several other officers, bearing also the title of C., were employed in the administration of justice and in the defence of the public order. The C. of France was the constitutional interpreter of the will of the sovereign; his functions being, on the whole, analogous to those exercised by the C. of England. As an instance in the charge of the value of money, not more remarkable than many which could be cited in our own country, it may be mentioned that, in 1290, the salary of this high official was six sous a day, with the privilege, to him and his, of eating at the court. When he was at Paris, and ate at his own lodgings, he had twenty sous a day. The office was abolished at the Revolution; and though it was restored by the Bourbons, and even under the first Napoleon the higher-sounding title of Archi-chancellor was revived, many of the functions of the old C. were transferred to the minister of justice, and have ever since been held by him.

In most of the other countries of Europe there are officers of state who bear this, or analogous titles,

though their powers and duties are very various. In Austria, Prince Metternich was 'C. of the House, of the Court, and of the State'; and in Prussia, Prince Hardenberg enjoyed a similar title. In Russia, the title of Vice-C. of the Empire is often given to the minister of foreign affairs. Besides these state-chancellors, there were officers in many other capacities to whom the title was given. Every bishop has his C. in the Church of Rome, and there are still Lew. C. of cathedrals, dioceses, universities, &c.

**CHANCELLOR, LORD.** There can be no doubt that the existence of the office in England, as in the other states of Europe, is to be ascribed to the influence which the constitution of the Roman empire had on the constitutions of the modern nations. This influence was exercised in no small measure through the medium of the church, the profession of the law being generally exercised by ecclesiastics; and it is for this reason, probably, that the bishop and the king are furnished with officers bearing the same title, and exercising analogous functions. The C. is always the confidential adviser of the sovereign in state affairs. It is for this reason that he has been called the keeper of his conscience, and that in England it is to him alone that can be constitutionally confided the most special function of sovereignty—that, namely, of modifying legal by equitable considerations. It is in this latter prerogative that the chief distinction exists between the C. and all other judges; for, whilst they are held by the letter of the law, he, in theory at all events, is entitled to modify it *iustitia bonum et cœcum*. In certain more special points of view, there is a similarity between the functions of the chancellors in different states. 'In all of them he seems to have had the supervision of all charters, letters, and such other public instruments of the crown as were authenticated in the most solemn manner; and therefore, when seals came into use, he had always the custody of the sovereign's great seal.'—Stephen's *Commentaries*, vol. iii. p. 388. It is from this last-mentioned circumstance that the office of C., or Keeper (q. v.), which, by 5 Elizabeth, c. 18, is declared to be exactly the same, is created without writ or patent, by the mere delivery of the great seal, and that the C., if a baron, takes precedence of every temporal lord not a member of the royal family, and of all bishops except the Archbishop of Canterbury. The C. is a privy-councillor by his office, a member of the cabinet, and prolocutor, or speaker of the House of Lords, by prescription. Though the form in which his tenure of office is terminated, is by the resumption of the great seal by the sovereign, the C. practically resigns office with the party to which he is attached. He has the appointment of all justices of the peace throughout the kingdom, but this privilege he exercises generally on the recommendation of the lord-lieutenants. But the most important, and, as it now seems, somewhat anomalous branch of his patronage, arises out of his having been originally an ecclesiastic. Though the last bishop who held the office was John Williams, Archbishop of York, who was Lord Keeper from July 10, 1621, to November 1, 1625, the C. still continues to be patron of all the crown livings of the value of £20 per annum, or under, in the King's Books—i. e., according to a valuation made in the time of Henry VIII., and confirmed in that of Elizabeth—and visitor of all hospitals and colleges of the king's foundation. As representing the paternal character of the sovereign, again, the C. is the general guardian of all infants, idiots, and lunatics, and has the supervision of all charitable uses in the kingdom. As regards his judicial patronage, the arrangement is, that the C. appoints in general all the judges of the superior courts, except the two chief-judges, who are

## CHANCELLOR OF A CATHEDRAL—CHANCERY.

nominated by the prime-minister of the day. Of inferior appointments, the latter also has reserved to him the commissioners of bankruptcy and the judges of the county-courts. All these functions the C. performs in addition to his extensive duties as the supreme judge of the Court of Chancery, both as an ordinary court of common law and of record, and as an extraordinary court of equity. Much inconvenience has arisen from the accumulation of duties in the single person of this high dignitary, and various expedients have been devised for lessening the evil. Vice-chancellors have been appointed, and the duties of the Master of the Rolls have been extended. The appointment of a Minister of Justice to share the C.'s duties has often been discussed, but the change is too fundamental to find favour in England; and temporary alleviations of the evil alone are likely to be considered practicable, till it assumes dimensions which render it absolutely intolerable. The salary of the C. is £10,000 a year, and he has an annuity of £5000 on his retirement from office. The style of the C., since the union with Scotland, has been Lord High Chancellor of Great Britain; but he has scarcely any jurisdiction in Scotland, and in Ireland there is a separate C., having powers in most respects the same as those of the C. of Great Britain. To slay the C. is treason under 25 Edward III c. 2.

**CHANCELLOR OF A CATHEDRAL** is an officer who superintends the arrangements for the celebration of the religious services. His office is quite distinct from that of the

**CHANCELLOR OF A DIOCESE**, who, as vicar-general to the bishop, is an ecclesiastical judge, appointed to assist the bishop in questions of ecclesiastical law, and hold his courts for him. By 37 Hen. VIII c. 17, it is provided that the C. of a diocese may be a layman, whether married or single, provided he be doctor of the civil law, lawfully created and made in some university. By the canons of 1603, he must be a bachelor of law, at the least, or a master of arts. There are certain cases, however, in which the bishop must sit in person. In case of complaint against a clerk in holy orders, for any ecclesiastical offence against the Church Discipline Act (3 and 4 Vict. c. 86), the bishop is to hear the cause, assisted by three assessors; of whom the dean of his cathedral, or one of his archdeacons, or his chancellor, must be one; and a serjeant-at-law, or an advocate who has practised five years in the court of the archbishop of the province, or a barrister of seven years' standing, another.

**CHANCELLOR OF A UNIVERSITY.** The highest honorary office connected with a university is generally that of chancellor. See UNIVERSITY.

**CHANCELLOR OF SCOTLAND.** Previous to the union of the two kingdoms in 1707, when the office was abolished, the C. of S. performed functions in many respects analogous to those which belong to the Lord High Chancellor of Great Britain. He presided in parliament, and was the head of all the courts of judicature; he was the chief counsellor of the king, and keeper of the great seal. From the fact of the distinction between law and equity in the English sense never having been recognised in Scotland, the C. had no judicial functions separate from those of the ordinary courts of law, but he had the principal direction of the Chancery, the constitution of which is described below. In early times, the C. of S., as of England, was very frequently an ecclesiastic; but the first, Constantine, Earl of Fife, in the reign of Alexander I, and the last, the Earl of Seafield, who held the office at the Union, were both laymen; and many other nobles, Earls of Argyle, Angus, Huntly, &c., appear

in the lists given in Crawford's *Officers of State*, and Chalmers's *Caledonia*. On the abolition of the office, a Keeper of the Great Seal was appointed, who acts merely ministerially in affixing it to the writs which pass under it. See GREAT SEAL.

## CHANCELLOR OF THE EXCHEQUER See EXCHEQUEER.

**CHANCE-MEDLEY, AND CHAND-MEDLEY**, or **MELLÉ** (Fr. *chaud*, hot; and *melle*, a fray), as it is called in Scotland, are French expressions borrowed by our law. Though often spoken of as synonymous, they are, in reality, distinct in meaning—the one signifying a casual affray; the other, an affray in the heat of blood or passion. Both are in this country, and in most others, recognised as pleas in mitigation of the offence of homicide (q. v.). See also SANCTUARY.

**CHA'NCERY** (Lat. *cancellaria*). As the Roman emperors, and after them the various sovereigns who divided the vast inheritance of the empire, had each a Chancellor (q. v.), so in every European kingdom there was an establishment called a C., where these officers performed their functions. If we imagine a large chamber divided by lattice-work (*cancelli*), the outer half devoted to the people, the inner occupied by the chancellor and his subordinates, engaged in framing edicts, letters of nobility, and the like, and engrossing them on parchment, and sealing them with the king's own seal in proof of their authenticity, and then handing them through the railings to the people without, we shall have a pretty good conception of the C. in its earliest form.

In France, as there were subordinate chancellors attached to the parliaments of the respective provinces, so there were subordinate chanceries; but the grand C. of France, which followed the person of the king, was alone, in strictness, entitled to the name.

The apostolic C. at Rome, in which, in addition to the documents pertaining to his temporal sovereignty, the bulls and briefs of the pope are authenticated, is presided over by a cardinal, with the title of Vice-chancellor.

**CHANCERY, OR CHA'NCELLARY**, of Scotland, is a public office in the General Register House, at Edinburgh, managed by the director of C. and his deputies, in which all charters, patents of dignities, gifts of offices, remissions, legitimations, presentations, commissions, briefs, retours, and other writs appointed to pass the great and quarter seals, are recorded. See GREAT SEAL.

**CHANCERY, COURT OF, IN ENGLAND.** Besides the functions pertaining to the chancellor in other countries, the Chancellor of England had early assigned to him the office of a judge; and the English C. consequently became a court of law, the peculiar character of which will be rendered intelligible by the following considerations: In assigning judicial functions to the chancellor's department, it was not intended that it should interfere with that other department of government which has everywhere been distinguished both from the legislative and the executive—viz., the judicial. But in all departments, according to the imperial theory from which the idea of the C. at least was derived, the sovereign was supreme, and to his will, or to his sense of justice, there was consequently an appeal in judicial, as in other matters. His chancellor, however, was his adviser in all matters whatsoever; and thus, though not a judge in the stricter sense, it is manifest that his counsel, in judicial matters of the highest importance, would constantly be called in. But further, the king governed by laws, even before he was governed by them; and for the sake of order and his own convenience, he would naturally depart

## CHANCRE—CHANDERNAGORE.

from the letter of the law which he had established, only where it could be shewn to him that it did not meet the substantial justice of the particular case. He would consequently be a judge, not of the interpretation or application of the law, which he would leave to his ordinary judges, but of its adequacy to circumstances which had changed, or had not been anticipated; and when he interfered, it would be to some extent in the character of a legislator, as well as of a judge. The king would thus be a judge in equity, in the popular and intelligible sense of that word; and acting in this capacity himself, it would be in this capacity that he would call in the aid of his chancellor. It is not mysterious, then, how in early times the Court of C. came to be a court of equity; and the chief difficulty regarding its origin seems to attach to the other of the two great departments into which it is divided, and in which it exercises jurisdiction as a court of common law. But as the free constitution of England developed itself, it soon became apparent that equity, in the old despotic or patriarchal sense—in which it was not so much the administration as the making or modifying of law—was inconsistent with its principles, whether it proceeded from a judge or from the monarch himself. The popular sense of equity was consequently abandoned; and a technical sense, unknown to the jurisprudence of every other nation, was given to it. The proceedings of the Court of C. 'on its equity side,' which had hitherto been a mere interference with law, came now to be hedged in by rules and precedents as closely as those of any court of common law. What henceforth continued to be the distinction *in principle* between law and equity, or between the functions of the courts of common law and the Court of C., or even of the two great departments of this court itself, it is perhaps impossible to state. The arbitrary line which has been drawn between the class of cases assigned to the one set of courts and to the other, will be considered under EQUITY.

The judicial duties of the chancellor have long been shared by the Master of the Rolls, an officer of high rank, who was originally appointed only for the superintendence of the writs and records appertaining to the common-law departments of the court, but who was accustomed also to sit as a separate though subordinate judge on the equity side. The disputes which had arisen regarding his powers were set at rest by 3 Geo. II. c. 30, which declares that all orders made by him, except such as by the course of the court are appropriated to the great seal alone, shall be valid, subject nevertheless to be discharged or altered by the Lord Chancellor, and so as that they shall not be enrolled till they are signed by his lordship. By 3 and 4 Will. IV. c. 94, the master's powers are further increased, and he may now hear motions, pleas, and demurrers, as well as causes generally. The salary of the Master of the Rolls (q. v.) is £6000 a year. The vast increase of business, and the still greater increase of arrears, during the previous half-century, rendered it necessary, in 1813 (53 Geo. III. c. 24), to appoint another assistant to the chancellor, under the title of the Vice-chancellor of England; and in 1841, when the equity business of the Exchequer was transferred to the C., two more vice-chancellors were added. Each of these judges sits separately from the Lord Chancellor, and their functions extend to both departments of the court. Their salaries are £5000 a year. The last important addition (14 and 15 Vict. c. 83) has been that of the lords justices of the Court of Appeal in Chancery. This court consists of the Lord Chancellor, together with these judges; but the lords justices, when sitting without the chancellor, possess the same jurisdiction which

belongs to him, and their existence does not prejudice his right to sit alone. The lords justices possess the same authority in matters of lunacy as the chancellor; and they, sitting together, constitute, without the chancellor, the Court of Appeal in Bankruptcy. An appeal, which may also be entertained by the Lord Chancellor sitting alone, lies to this court, from the Master of the Rolls, and from each of the vice-chancellors; and from these appellate jurisdictions there is an appeal in turn to the House of Lords. The lords justices may also take up original causes, though these, in practice, are mainly confined to the vice-chancellors and the Master of the Rolls. Till recently, certain parts of the equitable jurisdiction of the Court of C. were confided to the Masters in Ordinary (see MASTERS IN CHANCERY) and the Accountant-general. The office of the masters has been abolished, but that of the accountant continues to be one of the most important connected with the court. Besides these more important officers, the Court of C. has always had a large body of subordinates, registrars, tax-masters, and a staff of record and writ clerks attached to it.

The above details, however, are now only of historical interest. The subdivision of courts into those of equity and common law had long been found mischievous, inasmuch as it in some cases doubled the expense to the suitor, by sending him from one Court to another for instalments of the justice which he sought. For many years this anomalous arrangement had been given up as indefensible; and bills from time to time were introduced into parliament, in order to rearrange the courts, so as to administer entire justice in every case. Great changes were necessary in this department of the law, and the only question was at last reduced to the best mode of settling the details of the High Court of Justice, which was to supersede the previously existing courts. This radical reform of the law being achieved in England, it was felt it would no longer differ from Scotland and other countries in separating the administration of law from that of equity in any cases which call for their conjoint action.

In various colonies of the British empire, local courts have been established in imitation of the High Court of C., an institution which, from its cumbersome, anomalous, and unscientific character, scarcely merited imitation; but in America, though the distinction between law and equity was at first adopted and long adhered to with the tenacity with which Englishmen cling to their native customs, it has been abolished in the state of New York, and law and equity there, as elsewhere in the world, now constitute one system, administered in one series of tribunals of original and appellate jurisdiction. On the continent, the English Court of C. has always been a subject of ridicule; and a recent French writer, in speaking of it, says: 'Nothing ever comes to an end in it; and the unhappy man who has a process there, can be sure of but one thing—viz., that whether he gains it or loses it, his ruin is certain.' The acts by which evils which were inseparable from the constitution of the Court of C.—and which spring from the distinction between law and equity, on which its very existence depended—had been mitigated, were the following: 15 and 16 Vict. c. 80, 86, and 87, 21 and 22 Vict. c. 27.

CHANCRE. See SYPHILIS.

CHANDERNAGORE, a French city, with a scanty territory of about 2000 acres, on the right or west bank of the Hoogly, 21 miles above Calcutta by railway, on the opposite shore, in lat. 22° 50' N., and long. 88° 23' E. The population, estimated at

about 30,000, consists of a few Europeans and Eurasians (q. v.), and the rest natives of unmixed blood. Independently of political considerations, the place has, through the gradual silting up of the river, lost some of its commercial advantages. Within 100 years back, ships of the line ascended to C.; now, however, vessels even of far inferior burden seldom get above Diamond Harbour, which is nearly 50 miles further down. C. was established in 1676, and for awhile rivalled Calcutta. It was captured by Clive in 1757, but finally restored to the French in 1816.

**CHANDLER, DR RICHARD**, a scholar and antiquary of considerable eminence of the last century, was born at Elton, in Hampshire, in 1738, and educated at Oxford. He first became known as the editor of the magnificent work, *Marmora Oxoniensis*, published by the Oxford University in 1763. He afterwards travelled through Greece and Asia Minor, with Revett, an architect, and Paro, a painter, at the instance of the then flourishing Dilettanti Society, with a view to collect information regarding the former state of these countries, and to procure exact descriptions of the ruins. The result of their united labours appeared in 1769, in 2 vols., entitled *Ionica Antiquities*. C. also published a valuable account of the ancient inscriptions of Asia Minor and Greece; and his account of his travels in these countries, issued in 1775–1776, is still a standard work. He also published a *History of Troy*. He died in February 1810.

**CHANDORÉ**, a town and fort in the district of Ahmednuggar, presidency of Bombay, the lat. and long. being 20° 20' N. and 74° 14' E. The town is a flourishing place, with a population of 7000. The fort, which commands an important pass on the route between Candesh and Bombay, is situated on the summit of a hill naturally inaccessible everywhere but at the gateway. It surrendered to the British in 1804; and being subsequently restored to Holkar, was finally ceded by him in 1818.

**CHANDOSE CLAUSE.** During the discussion of the clauses of the Reform Bill (q. v.) in 1831, the Marquis of Chandos (Tory), afterwards Duke of Buckingham, proposed the insertion of a clause giving the county franchise to *tenants at will* occupying lands for which they paid an annual rent of £50. This was opposed by the ministers on the ground that the class proposed to be enfranchised would be subject to the coercion of the landowners, who would thus virtually determine the elections. The amendment, however, was supported by many of the Radicals, who at that time regarded any extension of the suffrage as a boon, and was carried by a majority of 84. The clause was incorporated in the bill of the following year, and was finally carried by a majority of 272 to 32. The result proved a material accession to the Conservative element in counties. Under the Reform Act of 1867, occupants of lands of a rateable value of £12 are entitled to the county franchise.

**CHA'NFRON.** See CHARGER.

**CHANGARNIER, NICOLAS ANNE THÉODOLE**, a French general, was born at Autun in 1793—and received his education at the military school of Saint-Cyr. In 1830, he went as lieutenant to Algeria, where he distinguished himself, and rose to the rank of general of division. After the proclamation of the Republic in 1848, he was appointed governor-general of Algeria, in the room of Cavaignac; but being chosen a member of the National Assembly, he returned to Paris, when he was appointed commander-in-chief of the garrisons of Paris and of the National Guard. He held this

758

double office till the middle of May 1849, and again for some time after the insurrectionary movements of June of that year. C. was a member of the Legislative Assembly, where he held a sort of neutral position between the Orleanists and Legitimists, and opposed to the Bonapartists. At the coup d'état in December 1851, he was sent to the fortress of Ham. He lived in exile till he offered his services to Louis Napoleon during the Franco-Prussian war. He was in Metz with Bazaine; and, when it capitulated, he retired to Brussels. He returned to France in 1871, entered the Assembly, and greatly assisted M. Thiers in reorganizing the army.

**CHANG-CHOW-FOO, or CHAOU-CHOW**, a city of China, and capital of a department of the same name, in the province of Keang-su, in 31° 50' N. lat., and 3° 24' long. E. of Pekin.

**CHANG-CHOW-FOO**, a city of China, and capital of a department of the same name, in the province of Fuh-keen, in 24° 31' N. lat., and 1° 24' long. E. of Pekin.

**CHANGELING.** It was at one time a common superstition, that infants were taken from their cradles by fairies, who left instead their weakly and starveling elves. The children so left were called *changelings*, and were known by their peevishness, and their backwardness in walking and speaking. As it was supposed that the fairies had no power to change children that had been christened, infants were carefully watched until such time as that ceremony had been performed. This superstition is alluded to by Shakespeare, Spenser, and other poets; and it has not yet quite died out of some of the rural districts in Britain.

**CHANG-SHA-FOO**, a city of China, capital of the province of Hoo-nan, in 28° 20' N. lat.

**CHANNEL, ENGLISH**—the *Mare Britannicum* of the ancients—is that arm of the Atlantic Ocean which divides England from France, gradually narrowing to the Strait of Dover. It is often called simply the Channel, and the fleet stationed in it for the protection of the English coast, the Channel Fleet. The greatest river which falls into it is the Seine. It forms bays both on the English and on the French coast; but the larger ones are those on the French coast, whilst the best harbours are on the English.

**CHANNEL ISLANDS**, a group of islands belonging to Great Britain, lying off the north-west coast of France, between Normandy and Brittany. They are about 120 miles south-west of Southampton, and the nearest distance from the French coast is about 10 miles. The C. I. are the only parts of the dukedom of Normandy now belonging to the English crown, to which they have been attached since the Conquest. King John, about the year 1200, lost all Normandy, except these isles. The chief islands of the group are Jersey, Guernsey, Alderney, and Sark. The area of the whole is 112 square miles, and the population in 1871 was 90,596. They are more particularly described under JERSEY.

**CHANNING, WILLIAM ELLERY**, D.D., a celebrated Unitarian preacher and author, was born 7th April 1780, at Newport, Rhode Island, in the United States, entered Harvard University at the age of 14, and took his degree in 1798. In 1803, he was ordained minister of a church in Boston. During the earlier years of his ministry, his theological peculiarities had little prominence in his discourses, and in consequence he stood upon friendly terms with his brethren in more orthodox churches. In 1819, however, he preached a sermon at the ordination of the Rev. Jared Sparks, in which he

advocated the Unitarian doctrine with so much zeal and ability, that he was termed the 'Apostle of Unitarianism.' This involved him in controversy, a thing which he naturally loathed. Nevertheless, to the end of his life, he preserved a devoutly Christian heart, shrinking with the delicate instinct of a pious nature from everything cold, one-sided, and dogmatical, whether Unitarian or Trinitarian. As late as 1841, he wrote: 'I am little of a Unitarian, have little sympathy with the system of Priestley and Balaam, and stand aloof from all but those who strive and pray for clearer light.' In 1821, he received the title of D.D., from Harvard University, on account of the high talent he had exhibited in his tractate on the *Evidences of Christianity*, his *Address on War*, and his *Sermons*. In 1822, he visited Europe, and made the acquaintance of several great English authors, such as Wordsworth and Coleridge, both of whom were strongly impressed in his favour. Coleridge said of him: 'He has the love of wisdom and the wisdom of love.' In 1823, he published an *Essay on National Literature*; in 1826, *Remarks on the Character and Writings of John Milton*; in 1829, the *Character and Writings of Fenelon*; in 1833, a work in opposition to *Negro Slavery*; and in 1838, an essay on *Self-culture*. Besides these, he wrote a variety of other essays and treatises, all characterised by vigour, eloquence, pure taste, and a lofty tone of moral earnestness. He died October 2, 1842, at Bennington, Vermont. An interesting memoir of him has been published by his nephew, William Henry Channing (3 vols., London, 1848).

**CHANTILLY**, a town of France, in the department of Oise, about 23 miles north-north-east of Paris. Being one of the most beautiful places in the vicinity of the metropolis, it attracts immense numbers of visitors from thence. Apart from its natural beauty, it is interesting as the place where the great Condé spent the latter years of his life in the society of such men as Boileau, Racine, and Bossuet. The magnificent château in which he resided was pulled down at the revolution of 1793; but a lesser château, one of the finest specimens of the renaissance in France, still remains. The park and grounds are very charming. C. is also noted for its extensive manufacture of the blonde lace. Pop. (1872) 2335.

**CHANTREY, SIR FRANCIS**, an eminent English sculptor, was born at Jordanthorpe, in Derbyshire, on 7th April 1781, not 1782, as has been generally said. His father, who was a carpenter, and rented a small farm, died when C. was only 12 years of age, leaving his mother in narrow circumstances. It is said that she gave him 'as liberal an education as her limited means would admit'; but much cannot be meant by the phrase, if it be true, as asserted by Holland in his *Memorial*, that his attendance at the little lane-side school was very irregular, and that 'for awhile he certainly drove an ass daily, with milk-barrels, between Norton and Sheffield.' C.'s mother married a second time, and the boy was, in 1797, apprenticed for 7 years to a carver and gilder in Sheffield called Ramsey. It was in this humble department that C. acquired the rudiments of his future art. It was during this period that his first attempts at modelling in clay were made, and that by the help of casts taken from the faces of his fellow-apprentices and his own, he began the work of portraiture, in which his great eminence ultimately consisted. C.'s apprenticeship was cancelled two years before its expiry; but his subsequent career is not very accurately known. It is certain that he visited both London and Dublin in 1802, probably in the capacity of a journeyman carver and gilder; and in that year he seems to have received

instruction as a pupil of the Royal Academy. It was probably then that he commenced seriously to prepare himself for the work of his future life. In the earlier part of his career as an artist, C. is said to have been under great obligations to Nollekens, who had the shrewdness to see, and the generosity to see without envy, his great promise in the branch in which he himself was eminent. In 1816, C. was elected an Associate, and in 1818 a Member of the Royal Academy; and in 1819 he visited Italy for the first time. Like the lives of many other eminent men, that of C. presents few claims on our interest after his early struggles were ended. As an ideal artist, he never attained a high rank, and, in comparison with Flaxman, he possessed little reputation in this country and none abroad. But he executed, with much truth to nature, as it presented itself to his eye, an endless variety and almost countless number of works of individual portraiture; so much so, that there is scarcely any town of importance in Great Britain which cannot shew specimens of his skill. As a consequence of the department of art to which he chiefly devoted himself, C. accumulated a very considerable fortune, the greater part of which, after providing for his widow, he bequeathed for artistic purposes. In this respect, he formed a remarkable contrast to Flaxman, whose modest savings were sworn under £4000; whilst Nollekens, whose name, at the distance of less than half a century, is almost forgotten, and who, in his own day, was a sort of humbler C., realised the enormous sum of £150,000, or it is even said £200,000. Sir Francis died childless on the 25th November 1841, and was buried in a tomb prepared by himself in the churchyard at Norton.

**CHANTRY** (Fr. *chanterie*, from *chanter*, to sing). The term C. is applied alike to endowments or benefices, to provide for the chanting of masses, and to the chapels in which the chanting takes place. These endowments were commonly made in the form of testamentary bequests, the object being to insure the erection of a chapel near, or over the spot where the testator was buried, and to remunerate the priests for saying masses in it for the benefit of his soul, or of the souls of others named in his will. Many such chantry chapels are still to be seen in English parish churches; but they were more common in abbeys and monastic establishments, in which it was considered a privilege to be buried, and where some such offering to the brotherhood was in a measure the price of sepulture. These chapels, which have generally the tomb of the founder in the middle of them, are separated from the aisles or nave of the church by open screen-work, a circumstance which has sometimes led to their being called Chancels (q. v.). Sometimes, again, they are separate erections, projecting from the church externally; but in cathedrals and the larger churches they are generally constructed within the church, often between the piers. Many chantries are lavishly enriched with sculpture and traceried of all descriptions, and some of them are adorned with gilding and painting.

**CHAOS** signified, in the ancient cosmogonies, that vacant infinite space out of which sprang all things that exist. Some poets make it the single original source of all; others mention along with it Gea, Tartaros, and Eros. By some also only the rough outlines of heaven and earth were supposed to have proceeded from C., while the organisation and perfecting of all things was the work of Eros. Still later cosmogonists, such as Ovid, represent it as that confused, shapeless mass out of which the universe was formed into a *kosmos*, or harmonious

## CHAOS—CHAPLAIN.

order. Hesiod makes C. the mother of Erebus and Nox.

**CHAOS**, or **BIRD ISLANDS**, is the name given to several rocky islets situated at the entrance of Algoa Bay, South Africa, about 35 miles east of Port Elizabeth. It was on one of these islands that Bartholomew Diaz, the navigator, died in 1500.

**CHAOU-CHOW-FOO**, a city of China, and capital of a department of the same name, in the province of Kwang-tung, in  $23^{\circ} 36' 6''$  N. lat., and  $0^{\circ} 46' 40''$  long. W. of Pekin.

**CHAOU-KING-FOO**, a city and capital of a department of the same name, in the province of Kwang-tung, 50 miles west of Canton, in  $23^{\circ} 4' 48''$  N. lat., and  $4^{\circ} 24' 30''$  long. W. of Pekin.

**CHAP BOOKS**, the name given to a variety of old and scarce tracts of a homely kind, which at one time formed the only popular literature. In the trade of the bookseller, they are distinguishable from the ordinary products of the press by their inferior paper and typography, and are reputed to have been sold by chapmen (see **CHAPMAN**) or pedlers; hence their designation. The older C. B. issued in the early part of the 17th c. are printed in black letter, and are in the form of small volumes. Those of a later date are in the type now in use, but are equally plain in appearance. Of either variety, they were mostly printed in London; many being without dates. They were of a miscellaneous kind, including theological tracts, lives of heroes, martyrs, and wonderful personages, interpretations of dreams, fortune-telling, prognostications of the weather, stories of giants, ghosts, hobgoblins, and witches, histories in verse, and songs and ballads. See *Notices of Fugitive Tracts and Chap Books*, also *Descriptive Notices of Popular English Histories*; both by J. O. Halliwell, printed for the Percy Society. An inferior class of tracts succeeded these books for the common people, and are best known as *Penny Chap Books*. For the most part they consisted of a single sheet, duodecimo, or 24 pages. Besides the title, the first page usually contained a coarse wood-cut embellishment. The paper was of the coarsest kind adapted for printing, and the price, as the name imports, was a penny each. The subjects, besides being of a similar nature to the above, included stories of roguery and broad humour. These penny C. B. were issued by an obscure class of publishers in London and several English provincial towns, of which we might particularise Newcastle-on-Tyne. They were also issued from the presses of Edinburgh, Glasgow, Falkirk, and Paisley. It is a curious fact, that nearly all the penny C. B. of this very homely kind which were latterly popular, were written by Dougal Graham, who, previous to his death in 1789, filled the office of bellman or town-crier of Glasgow. The most reputable production of this humble genius was a *History of the Rebellion* in a Hudibrastic metre, which was a great favourite with Sir Walter Scott, and is now scarce; see *Chambers's Journal*, First Series, vol. x. p. 84; also the *Paisley Magazine* (1828), an extinct publication of great rarity, in which is given a biographic sketch of Dougal Graham, with a list of his productions. In some parts of Scotland and the north of England, Graham's penny C. B. are still seen on stalls at markets; but the general advances in taste, along with the diffusion of an improved literature, have displaced them in almost all other quarters. Collections of the older C. B. are now found only in the libraries of bibliomaniacs, by whom they have been picked up at extravagant prices from dealers in second-hand books. In various continental countries, there are

numerous varieties of C. B. at exceedingly small prices. The French government being desirous to substitute a wholesome class of tracts of this kind for what are generally objectionable on the score of taste and morality, have lately, through commissioners, taken some steps on the subject. See *Histoire des Livres Populaires, ou de la Littérature du Colportage*, by M. Nizard. w. c.

**CHAPALA**, the largest lake in Mexico, containing about 1300 square miles. It is about lat.  $20^{\circ} 20'$  N., and ranges in W. long. from  $102^{\circ}$  to  $103^{\circ} 25'$ . It is merely an expansion of the Rio Grande de Lerma, which enters the Pacific at San Blas. C. lies on the table-land of Anahuac, and has many islands.

**CHA'PEL** (Fr. *chapelle*), a word derived from *capa*, which originally signified a case, or chest in which were contained the relics of a saint, and afterwards the place where the chest was kept. The term now signifies a building erected for the purposes of public worship, but not possessing the full privileges and characteristics of a church. In this sense, all places of worship erected by dissenters are now called chapels in England, and the term is also applied to supplementary places of worship, even though in connection with the established church—such as parochial chapels, chapels of ease, free chapels, and the like. In former times, it was applied either to a domestic oratory, or to a place of worship erected by a private individual, or a body corporate. In the latter sense, we speak of chapels in universities and colleges. But its earliest signification was that of a separate erection, either within or attached to a large church or cathedral, separately dedicated, and devoted to special services. See **CHANTRY**. Chapels had no burying-ground attached to them, and the sacrament of baptism was not usually administered in them.

**CHAPELLE, LA**, the name of several places in France, the most important of which forms a northern suburb of Paris. Chemicals, salt, starch, liqueurs, &c., are manufactured.

**CHAPELLE DE FER**. See **HELMET**.

**CHA'PERON**, a hood or cap worn by knights of the Garter. Such a hood was at one time in general use, but was latterly appropriated to doctors and licentiates in colleges. A person who acts as a guide and protector to a lady at public places, is called a C., probably from this particular piece of dress having been used on such occasions. The name was also applied to devices which were placed on the heads of horses at pompous funerals.

**CHA'PLAIN** was originally the title of the ecclesiastic who accompanied an army, and carried the reliques of the patron saint. See **CHAPEL**. It has now come to signify a clergyman not having charge of a parish, but employed to officiate at court, in the household of a nobleman, or in an army, garrison, ship, &c. Such officials began early to be appointed in the palace of the Byzantine emperors. The practice afterwards extended to the western empire, and to the courts of petty princes and even of knights, and continued to subsist after the Reformation. Forty-eight clergymen of the Church of England hold office as chaplains of the Queen in England, four of whom are in attendance each month. Six clergymen of the Church of Scotland have a similar title in Scotland; but their only duty is to conduct prayer at the elections of Scottish representative peers. A statute of Henry VIII. limits the right of nominating private chaplains in England: thus, an archbishop may have eight, a duke six, a baron three; and chaplains so appointed

have certain privileges, and may hold two benefices with cure of souls.

An ARMY CHAPLAIN is a clergyman whose services are retained especially by the government for the soldiery of the army. There have been such chaplains for many generations, and the office was at one time regarded as a saleable perquisite; but the system was reorganised and improved in 1796. In recent years, Roman Catholic and Presbyterian chaplains have also been appointed, a practice which indicates the progress of toleration. The chaplains belong, not to regiments, but to the staff of the army, so as to be generally available. At home, they are attached to the military stations; but in the field they are located at headquarters, at the hospitals, and with the divisions. The officers at the stations usually arrange for the men to attend divine service at the nearest parish church; but this still leaves the chaplains many duties to fulfil. Where, as sometimes happens, there is no regular church or chapel near at hand, the C. reads and preaches to as many men as can conveniently group themselves around him at one time, and thus serves many different congregations at different times of the Sunday. He visits the sick at the hospitals, and examines and encourages the regimental schools. Among the wooden huts at Aldershot Camp, a church has been built, which is rendered available for chaplains of different religious denominations in succession.

When the system of army-chaplains was remodelled in 1796, a *chaplain-general* was appointed; this office was abolished by the Duke of Wellington soon after the termination of the great war, but revived by Mr Sidney Herbert in 1846. The C.-general, who receives £1000 per annum, has duties partaking somewhat of those of an arch-deacon. He assists the War Office in selecting chaplains, and in regulating the religious matters of the army, so far as Church of England matters are concerned. His office forms one of the 8 departments under the new organisation of the War Office. There are 78 chaplains on the staff, besides officiating clergymen (not belonging to the army), and chapel-clerks. The commissioned chaplains receive from 10s. to 22s. 6d. per day, besides allowances; and there are always some on half-pay; while the officiating clergymen receive head-money for the troops attending their ministrations. The whole expenditure for chaplains, and other charges connected with divine service, figures in the Army estimates for 1873–1874 at £46,800.

NAVY CHAPLAIN. Every ship in commission, down to, and including fifth-rates, has a chaplain. The Navy Estimates (1873–1874) provide for 83 commissioned chaplains, at stipends varying from £219 to £401 per annum. The chaplains perform divine service at stated times on shipboard, visit the sick sailors, and assist in maintaining moral discipline among the crew.

CHAPLET, a garland or head-band of leaves and flowers. In heraldry, a C. is always composed of four roses, the other parts being leaves.

CHAPMAN, a trader, but popularly applied in a more limited sense to a dealer in small articles, who travels as a pedler or attends markets. C. is from *chap*, equivalent to *cheap*, a word which in its origin signified a market or place for trading; hence *Cheapside*, *Eastcheap*. See CHAP BOOKS.

CHAPMAN, GEORGE, dramatist and translator, was born in 1557, educated at Cambridge and Oxford, and was the contemporary and friend of Spenser, Jonson, and Shakespeare. His first play, entitled *The Blind Beggar of Alexandria*, was printed in 1598. Up to 1620, he supplied the

theatre with tragedies and comedies, and some of these, after the fashion of the time, were written in conjunction with other dramatists. As a writer for the stage, C. does not rank high. Despite many nervous passages, his plays want the irradiation of a constant genius, and his characters are unnatural. As a translator, he has no equal. His translation of the *Iliad* is the finest that has yet been executed in England, and in reading it, many have felt with Keats—

Like some watcher of the skies

When a new planet swims into his ken.

C. seems to have led a long, temperate, and happy life, unblasted by poetic fire. He closed his career in 1634, at the age of 77.

CHAPPED HANDS AND CHILBLAINS, a lesser and a greater form of disease of the skin, produced by undue exposure to extremes of cold and heat, and affecting chiefly the most exposed joints, the skin over which swells and cracks, with itching, pain, and heat; in the most severe cases there is ulceration, which is difficult to heal in proportion to the length of time the disease has been neglected. Chilblains may generally be avoided if the hands are washed always with tepid water, and not habitually exposed to great cold, or when cold, to the heat of a fire. When formed, they may be treated with oxide of zinc ointment; or with a dilute solution of borax in glycerine and water; or with glycerine alone, slightly diluted with water; the hands being in any case habitually covered with woollen gloves in cold weather.

CHA'PTER-HOUSE (Fr. *chapitre*), the building in which the monks and canons of monastic establishments, and the dean and prebendaries of cathedral and collegiate churches, meet for the management of the affairs of their order or society. See CATHEDRAL. Chapter-houses frequently exhibit the most elaborate architectural adornment, as, for example, those at York, Southwell, and Wells. The original stained-glass windows remain at York, and are of exquisite beauty. On the walls of that at Westminster, the original painting has been discovered. Chapter-houses are of various forms: those at York and Westminster are octagonal; those at Oxford, Exeter, Canterbury, Gloucester, &c., are parallelograms; Lichfield is an oblong octagon; Lincoln, a decagon; and Worcester, a circle. They are always contiguous to the church, and are generally placed to the west of the transepts. They generally either open into the church, or are entered by a passage. Chapter-houses were often used as places of sepulture, and have sometimes crypts under them, as at Wells and Westminster.

CHARA'CEÆ, aquatic plants, forming, according to some botanists, a distinct natural order of acotyledonous plants; according to others, a sub-order of *Alga*. Their stems are tubular, consisting either of a single tube, or of parallel tubes, a central one with smaller ones applied to its surface; they are either pellucid or incrusted with carbonate of lime, which is not to be regarded as a mere accidental incrustation, but belongs to their proper structure; and they have whorls of symmetrical tubular branches. They grow in stagnant waters, both fresh and salt, are always submerged, and often completely conceal muddy bottoms. A number of species are natives of Britain, all belonging to the genus *Chara*. The organs of reproduction are of two kinds—lateral *globules*, and axillary *nucules*. These organs have caused no little difficulty to botanists; the nature and use of the globules in particular being by no means well understood. The simple cellular structure of the C., apart from

## CHARACINIDÆ—CHARADE.

all consideration of their reproductive organs, associates them with the lower Algae, rather than with

*Chama vulgaris.*

phanerogamous plants. None of them is of any known use. It was in the C. that the beautiful phenomena of *Cyclosis* (q. v.) were first observed. Sir David Brewster discovered that each of the minute calcareous particles incrusting the C. possesses double refraction, and has regular neutral and depolarising axes.

*Fossil Characea*.—The calcareous incrustation which covers the organs of reproduction, as well as the stems of some C., has, from its power of resisting decomposition, caused the abundant preservation of this order in the Tertiary fresh-water strata. The nucules originally described under the name of *gyrogonites*, and supposed to be foraminiferous shells, have been noticed by E. Forbes in strata as old as the Middle Purbeck beds. No remains of these have been observed in newer deposits, until we find them in the Tertiaries. The nucules, associated with *Lymnaea* and *Planorbis*, are very abundant in the Eocene Brambridge beds (q. v.).

**CHARACINIDÆ.** See **SALMONIDÆ**.

**CHARACTER** (Gr. *charasse* or *charatæ*, which signifies to scrape, cut, or engrave), means what is engraved on an object, either physically by the action of another external object or objects, or morally by the passions, the affections, by good or evil fortune, and by what we designate generally as ‘circumstances.’ In art, the expression of C., either in animate or inanimate objects, is, after correct delineation, the most important matter to be attended to. Though, properly speaking, all distinguishing marks are included under it, it is more generally used to designate those which mark individual from individual, than species from species, or genus from genus.

**CHARACTER TO SERVANT.** The master is under no legal obligation, either in England or in Scotland, to give a character to his servant, however long, faithfully, or efficiently he may have served him; the duty of bearing testimony in his favour being one which, however binding in morality, it has not been found convenient to enforce by positive law; but, if given, the character must be strictly true, or, at all events, in accordance with the master's belief, otherwise he may be exposed to

an action of damages, either by the servant whom he has calumniated, or by a subsequent employer, whom he has deceived. If true, however, the fact of its being prejudicial will expose the master to no risk. In order to justify the giving of a bad character, however, it must, in general, be asked for by the servant, as the master is not entitled needlessly to publish the servant's defects. In that case, it will lie with the servant to prove its falsehood, not with the master to prove its truth. The case of the servant being known by the master to have committed a felony while in his service, is, however, an exception to this rule, as, in a case so extreme, the master is at liberty to warn others against taking him into their employment. Even though strictly true, the character, if prejudicial, must not be more so than the circumstances render necessary. Acts of petty dishonesty, such as are too common amongst servants, will not warrant the master in branding him as a thief. The safe course, in such a case, is to state the offence, and not to describe it by a general epithet, which may convey an erroneous impression of its magnitude.

It is probable that, partly from thoughtless goodness, and partly from a selfish desire to get rid of a bad servant in the most comfortable manner, false characters are given in favour of servants very much more frequently than to their prejudice. It is desirable that masters and mistresses should have in view that they may render themselves liable in reparation of any damage which can be shown to be the direct result of thus inflicting on a stranger a wrong which is unquestionably within the reach of the law.

By 32 George III. c. 56, personating a master, and thus giving a false character to a servant, or asserting in writing that a servant has been hired for a period of time, or in a station, &c., contrary to truth; and any person offering himself as a servant, pretending to have served where he has not served, or producing a false certificate, or altering a certificate, or pretending not to have been in any former service, &c., are offences at common law, punishable on conviction before two justices with a fine of £50. This statute does not extend to Scotland.

**CHARACTERISTIC.** See **LOGARITHMS**.

**CHARADE**, or ‘syllable-puzzle’ as the Germans call it, is an amusement which consists in dividing a word of one or more syllables into its component syllables, or into its component letters, predicating something of each; and then, having reunited the whole, and predicated something of that also, the reader or listener is asked to guess the word. As a specimen of the C. depending upon syllables, we adduce the following:

‘My first is ploughed for various reasons, and grain is frequently buried in it to little purpose. My second is neither riches nor honours, yet the former would generally be given for it, and the latter is often tasteless without it. My whole applies equally to spring, summer, autumn, and winter; and both fish and flesh, praise and censure, mirth and melancholy, are the better for being in it. *Ana. Saxon.*’

As a specimen of the second class of charades, we take the following happy example from the French:

‘Quatre membres font tout mon bien,  
Mon dernier vaut mon tout, et mon tout ne vaut rien.’

The word is *zero*. It is composed of four letters, of which the last—viz., o, is equal to zero; the whole, zero itself, being equal to nothing.

But besides charades of this nature, there is another kind rather popular at evening-parties—the *acted* C.: the character of which is entirely dramatic. Half a dozen or so of the company

## CHARADRIADÆ—CHARGE.

retire to a private apartment, and there agree to select a certain word, as the subject of the C.; let us suppose INNKEEPER. The next thing done is to take the first syllable, INN, and arrange a little scene and dialogue, each member taking a certain part. This being accomplished, the amateur actors return to the drawing-room, and commence their performance, the rest of the company constituting the spectators. Care is taken to mention conspicuously, and yet not obtrusively, in the course of the dialogue, the word INN, which is the subject of the scene. On its conclusion, they again retire, and devise a new series of incidents for the word KEEPER, generally something in connection with a menagerie or a madhouse. This being also represented, they retire for a third time, to contrive the final scene, into which both words, or rather the whole word, Innkeeper, must be dexterously introduced at an odd moment when the spectators are thought to be off the scent. The company are then asked to guess the word. In order to the effective performance of a C. of this sort, the actors must possess a good share of inventiveness, self-possession, and ready talk, as the greater portion of the dialogue has to be extemporised.

**CHARADRIADÆ**, a large family of birds, of the order *Grallatores*, and tribe *Præsotres*, chiefly abounding in the temperate parts of the Old World, and generally frequenting sandy unsheltered shores and open moors and downs. They have a short bill, generally soft at the base, hard and often a little inflated towards the tip; long and powerful wings; long legs; and short toes, generally only three in number, and all directed forward, but sometimes they have also a very small hinder toe. They run with great swiftness: they generally congregate in flocks, at least during certain parts of the year; many of them are nocturnal in their habits; many are migratory. The Plovers (*Charadrius*) give their name to the family, which includes also Lapwings, Pratincoles, Oyster-catchers, Turnstones, Sanderlings, &c.

**CHARBON ROUGE**, or RED CHARCOAL, is a variety of charcoal obtained by subjecting wood to the action of heated air from furnaces, or of steam, which has been raised to a temperature of 572° F. Air-dried wood, by the ordinary process of charring, yields at the best 21 to 26 per cent. of black charcoal; but when acted on by heated air or steam, as mentioned above, 38 or 42 per cent. of C. R. is obtained. It is now prepared largely in France and Belgium, and is used in stoves for heating, and in the preparation of gunpowder. It has a dark-red colour, and consists of about 75 per cent. pure carbon, and 25 per cent. hydrogen and oxygen.

**CHA'RCOAL** is a popular term applied to charred wood, or coal produced by charring wood. There are several other varieties of C., however, for which see CARBON, ANIMAL CHARCOAL, WOOD CHARCOAL, COKE, BLACK-LEAD, &c.

**CHARCOAL BLACKS** are made both from animal and vegetable substances—e.g., burnt ivory, bones, vine-twigs, peach-stones, nut and other shells, the smoke of resin condensed, &c. Those which are derived from vegetable substances, when mixed with white, are usually of a blue tint. See LAMP BLACK.

**CHARENTE**, a considerable river in the west of France, rises in the department of Haute-Vienne, about 14 miles north-west of Châlus. It first flows north-west to Civray, where it turns southward into the department of Charente to Angoulême, thence it flows westward past Châteauneuf, Jarnac, and Cognac, and entering Charente-Inférieure, it

runs north-west past Saintes, and falls into the Atlantic below Rochefort, and opposite the islands Oléron and Aix. This river gives its name to two departments, both remarkable for the productivity of their vineyards; but the wines are mostly used in the preparation of brandy and liqueurs.

**CHARENTE**, a department of France, formed chiefly out of the old province of Angoumois, and situated in lat. 45° 10'—46° 8' N., and long. 0° 50' E. and 0° 30' W. Area, about 2200 square miles. Pop. (1872) 367,520. It is generally hilly, and is watered by the river Charente, above noticed, and its tributaries, the Tardouère and the Bandiat, with the rivers Vienne and Dronne. The highest chain of hills in the north of C. is a continuation of the heights of Limousin, forming the watershed towards the Loire. Remains of marine productions shew that the basin of the C. was once filled by the ocean. The soil is mostly limestone, here and there interrupted by banks of clay and gravel. Only a portion of the arrondissement Confolens has a rich vegetable clay-mould. The clay-soil is cool and moist, while the limestone district is dry and hot. The hills are in many places clad with chestnut forests. The climate is generally mild and healthy. The wines grown are spirituous and fiery in flavour, and are chiefly used in the manufacture of Cognac, which forms the most important of the exports. Truffles grow abundantly in several parts. Industry is in rather a backward condition. C. is divided into the five arrondissements of Angoulême, Cognac, Ruffec, Barbezieux, and Confolens.

**CHARENTE-INFÉRIEURE**, a maritime department of France, which includes the former province of Angoumois, with the greater part of Saintonge, and a small portion of Poitou. It lies in lat. 45° 5'—46° 19' N., and long. 0° 7' E.—1° 13' W. The Bay of Biscay washes its western boundary—the coast-line, which is very broken, measuring about 100 miles. Area, 2740 sq. m. Pop. (1872) 465,653. It is watered on its boundaries by the Sèvre-Niortaise and the Gironde, and in the centre by the navigable Charente and the coast-stream Sendre. The surface is level; and the soil—near the coast, intersected by ridges of rock and sand-banks, and protected from the sea by dikes—is mostly chalky and sandy, but very fertile, producing hemp, flax, saffron, and wine in great quantities. The commerce, facilitated by the structure of the coast, and by canals in the interior, is considerable, consisting chiefly of brandy and sea-salt, which is found in the department in great abundance. The oyster and pilchard fisheries are important. The chief harbours are those of Rochefort, and La Rochelle, the latter of which is the chief town. C. is divided into the six arrondissements of La Rochelle, Rochefort, Marennes, Saintes, Jonzac, and St Jean-d'Angely.

**CHARENTON-LE-PONT**, a town of France, in the department of Seine, situated on the right bank of the Marne, 5 miles south-east of Paris. The bridge over the river, which is important, from a military point of view, being considered one of the keys of the capital, and which has frequently been the scene of conflicts, is defended by two forts, forming a part of the fortifications of Paris. At the other side of the river is the National Lunatic Asylum, formerly called Charenton St Maurice, and now St Maurice simply. Pop. (1872) 6690.

**CHARGE**, in Heraldry. The figures represented on a shield are called charges, and a shield with figures upon it is said to be charged (Fr. chargé). The charges in a shield ought to be few in number, and strongly marked, both as regards their character and the mode of their representation. The family shield, belonging to the head of the house,

members.

**CHARGE**, in Military Warfare, is a sudden and impetuous attack on the enemy, by horse or foot, or both. Its object usually is to drive the enemy from a particular position; but if made with a much stronger force, it may result in his actual destruction.

**CHARGE**, in Military Pyrotechny, is sufficient combustible material for one firing or discharge. It is applicable to all kinds of firings, fireworks, and explosions; but the name is generally given to the quantity of gunpowder requisite for firing off a gun, &c. In cannon, this varies greatly, from  $\frac{1}{4}$  to  $\frac{1}{2}$  of the weight of the shot; some of the rifled ordnance now coming into use are remarkable for the smallness of the C. with which they are fired. The quota of C. will be mentioned in connection with the various kinds of firearms described in the *Encyclopædia*. In breaching a wall, a greater C. is necessary than in attacking a ship or a column of troops, even with the same kind of gun and projectile.

**CHARGE**. In the law of Scotland, a C. is a command to perform an act, conveyed in the letters of the sovereign. The same term is applied to a messenger's copy for service, requiring the person to obey the order contained in the letters—e. g., a C. on letters of horning, or a C. against a superior.

**CHARGER** is a name sometimes given to a war-horse, accustomed to the din of battles, and reliable under circumstances of confusion and danger. In the middle ages, when armour was used, and gunpowder unknown, the military horses were *barbed* or *barded* when ridden by men-at-arms—that is, they were nearly covered with armour. The face, the head, and the ears were covered with a mask called a *cianfron*, to prevent fright when charging the enemy; and an iron spike projected from the middle of the forehead. The neck was defended by small plates called *crinières*; the breast by a *poitrinal*; and the buttocks and haunches by *croupières*. These various pieces of armour were mostly made of metal, but sometimes of tough leather. The horse was occasionally covered with chain-mail; and in other instances with a *gambeson* of stuffed and quilted cloth. The man-at-arms generally rode another horse when not charging, to relieve the C. from his great burden. The barbed or *bardé* horse received its name from an old French word implying covered, clothed, or armed. A war-horse is still called a C., though not armed as in ancient times.

**CHARGÉS D'AFFAIRES** are fourth-class diplomatic agents, accredited, not to the sovereign, but to the department for foreign affairs; they also hold their credentials only from the minister, and are sometimes only empowered by an ambassador to act in his absence.

**CHARIOT**, in ancient times, was a kind of carriage used either for pleasure or in war. According to the Greeks, it was invented by Minerva; while Virgil ascribes the honour to Erechthonius, a mythical king of Athens, who is said to have appeared at the Panathenaic festival founded by him, in a car drawn by four horses. The ancient C. had only two wheels, which revolved upon the axle, as in modern carriages. The pole was fixed at its lower extremity to the axle, and at the other end was attached to the yoke, either by a pin or by ropes. The Greeks and Romans seem never to have used more than one pole, but the Lydians had carriages with two or three. In general, the C. was drawn by two horses. Such was the Roman *Biga* (q. v.), but we also read of a *triga*, or three-horse C., and a *quadriga*, or four-horse one. The last was that in which the Roman

764

The war-C. held two persons—the sonner number and the driver, the latter of whom usually occupied the front; but the chariots used by the Romans in their public games held only the charioteer.

The oldest war-chariots of which we read are those of Pharaoh (Exodus xiv. 7). All the eastern nations used them, while we learn from Caesar (*De Bell. Gall.*, v. 19) that the Britons also were familiar with their use.

**CHARITABLE USES AND LAW OF CHARITIES.** The law of England has always anxiously, though too often ineffectually, sought to provide for the preservation and proper application of the public and private endowments in that country for charitable purposes. The preceding efforts of the legislature in this direction may now be said to have been superseded by the Charitable Trusts Acts (16 and 17 Vict. c. 137, 18 and 19 Vict. c. 124, 23 and 24 Vict. c. 136, and 32 and 33 Vict. c. 110). See **CHARITY COMMISSIONERS**. As these statutes now contain a species of code of charity-law, it will here only be necessary to mention certain general principles which govern the law of England in its relation to charities. The courts of equity are those which in general take cognizance of all charitable uses, or trusts of a public description. Under the authority of these tribunals—or, in cases in which the annual income does not exceed £50, in accordance with the act just quoted, under that of the county courts of the district—trustees may be called to account for the funds committed to their charge, or new trustees may be appointed, improvident alienations may be rescinded, schemes for carrying the donor's object into effect may be judicially considered and adopted, and every species of relief afforded which such institutions require. Where the management of the charity has been confided by the donor to governors and other functionaries, the law will not interfere with their proceedings unless they can be shewn to be squandering the revenues or otherwise abusing the trust. Where the crown is founder, the Lord Chancellor is visitor, but in his personal character only, and not as judge of the Court of Chancery. As regards the nature of the trusts to which the equitable jurisdiction of the Chancery extends, it is necessary to remark that the word *charitable* here includes institutions for the advancement of learning, science, and art, and, indeed, for all useful public purposes, as well as for the support of the poor. It also comprises all donations for pious and religious objects, under which are included all those which tend to the benefit of the Church of England, or of any body of dissenters sanctioned by law. Roman Catholics were admitted into this category by 2 and 3 Will. c. 115, and Jews by 9 and 10 Vict. c. 59, s. 2. The charity, or other benevolent purpose, however, must be public; 'for if a sum of money be bequeathed, with direction to apply it to such purposes of benevolence and liberality as the executor shall approve,' or even 'in private charity,' the law will take no notice of such a trust.

Legacies to pious or charitable uses are not by the law of England entitled to a preference, though such was the doctrine of the civilians; but where a deficiency of assets arises, they are abated in proportion with the others.

**CHARITY, SISTERS OF.** See **SISTERS OF CHARITY**.

**CHARITY COMMISSIONERS.** A body of commissioners was created in 1853, by the Charitable Trusts Act, 16 and 17 Vict. c. 137 (see **CHARITABLE USES**), with power to inquire into all charities in England and Wales, with reference to their

nature, objects, and administration, and the amount and condition of the property belonging to them. The commissioners have power to call for the production of accounts and documents from trustees, and to appoint inspectors to visit and report on their management. The statute does not extend to Scotland or Ireland, to the English universities, or to the city of London. An annual report of their proceedings must be laid before parliament by the commissioners.

**CHARIVARI** is a French term used to designate a wild tumult and uproar, produced by the beating of pans, kettles, and dishes, mingled with whistling, bawling, groans, and hisses, and got up for the purpose of expressing a general dislike to the person against whom it is directed. The etymology of C. is obscure; the Germans translate it by *Katzennusik*, the English of which is *caterwauling*. In France, during the middle ages, a C. was generally raised against persons contracting second nuptials, in which case the widow was specially assailed. On these occasions, the participants in it, who were masked, accompanied their hubbub by the singing of satirical and indecent verses, and would not cease till the wedding couple had purchased their peace by ransom. C. answers to the English concert upon 'marrow-bones and cleavers,' with which it was customary to attack a married couple who lived in notorious discord. It was also got up against an unequal match, such as where there was great disparity in age between the bride and bridegroom.

Similar customs seem to have existed under different names in all parts of Europe, and sometimes they were of such a licentious and violent character as to require military interference to put them down. Even as early as the 14th c., the church found itself forced to threaten punishment, and even excommunication, against those who participated in them. In more recent times, the C. has taken a purely political colouring; as, for example, during the Restoration in France, at which time, however, the popular voice began to seek vent by casting its satirical darts against public men through the press. The papers published for this purpose were called C., the most famous among which is the **CHARIVARI**, which was established in Paris, December 2, 1832, corresponding to the English publication, *Punch*.

**CHARCOV.** See **KHARKOV**.

**CHARLATAN**, a mountebank, quack-doctor, or empiric, and hence any one who makes loud pretensions to knowledge or skill that he does not possess. The word seems to be derived from the Ital. *ciarfare*, to babble or talk, the chief art of the C. consisting in talk. Charlatanism abounds in all departments of life, and manifests itself in various ways according to the subject and character of the person. It changes also in form with the spirit of the time. The medical C. no longer appears on a stage in the guise of Doctor Ironbeard, but as a fine-dressed gentleman, receiving grateful acknowledgments through the newspapers, and publishing popular medical books, with the address of the author, and recommendations to apply to him. It has not unfrequently happened, however, that extraordinary men who were so far before their age as not to be understood by it, such as Paracelsus, have passed for charlatans until more justly estimated by later times. Several books have been written on the charlatanism of scholars. J. B. Mencke's satire, *De Charlataneria Eruditorum* (Leip., 1715), is a classical work, which has been continued by Büschel in his book, *Ueber die Charlatanerie der Gelehrten seit Mencke*.

**CHARLEMAGNE**, i. e., Charles the Great, king of the Franks (768—814 A.D.), and Roman emperor (800—814 A.D.), was born on 2d April 742, probably at Aix-la-Chapelle, and was the son of Pepin the Short, the first Carlovingian (q. v.) king of the Franks, and grandson of Charles Martel (q. v.). On Pepin's death in 768, he and his brother Carloman jointly succeeded to the throne. By Carloman's death, and the exclusion of both his sons from the throne, C. became sole king. In 772, it was resolved in the Diet at Worms to make war against the Saxons, for the security of the frontiers, which they continually threatened, and for the extension of the Christian religion. C. advanced as far as the Weser in 772, securing his conquests by castles and garrisons. Pope Adrian I now called him to his aid against Desiderius, king of the Lombards. C. had married the daughter of Desiderius, and had sent her back to her father because she bore him no children, and married Hildegard, daughter of the Swabian duke, Godfrey. Desiderius had sought revenge by urging the pope to crown the sons of Carloman, and on the pope's refusal, had laid waste the papal territory. C. crossed the Alps from Geneva, with two armies, by the Great St Bernard and Mont Cenis, in 773, and overthrew the kingdom of the Lombards in 774. The Lombard dukes acknowledged him as their king, and he secured the pope's favour by confirming the gift which Pepin had made to the papal see, of the exarchate of Ravenna. In 775, he was again employed in the most northerly part of his dominions, reducing the Saxons to subjection; in 776, he suppressed an insurrection in Italy; in 777, he so completed his victory over the Saxons, that their nobles generally acknowledged him as their sovereign in an assembly at Paderborn. Being now invited to interpose in the wars of the Arabs and Moors in Spain, he hastened to that country in 778, and added to his dominions the regions between the Pyrenees and the Ebro. From Spain he was summoned in haste by a new insurrection of part of the Saxons, who had advanced almost to Cologne, but whom he drove back to the Elbe. In 781, he went to Italy, where the pope crowned his second son, Pepin, king of Italy, and his third son, Louis, an infant of three years old, king of Aquitaine. The Saxons once more rising in arms, defeated and destroyed a Frankish army on the Sintel in 782, which C., after a new victory, fearfully revenged by causing no fewer than 4500 prisoners to be executed as rebels in one day. A more general rising of the Saxons followed, but in 783—785, the Frankish monarch succeeded in reducing them completely to subjection, and in persuading their principal chiefs to submit to baptism, and to become his faithful vassals. Subsequent insurrections and wars in Germany, between this year and 800, resulted in victories over the Bulgarians and Huns, and in the further consolidation and extension of his empire, the eastern boundary of which now reached to the Raab.

In 800, C. undertook an Italian campaign, which was attended with the most important consequences. Its immediate purpose was to support Pope Leo III. against the rebellious Romans. When C., on Christmas Day, 800, was worshipping in St Peter's Church, the pope unexpectedly, as it appeared, set a crown upon his head, and, amidst the acclamations of the people, saluted him as Carolus Augustus, emperor of the Romans. Although this added nothing directly to his power, yet it greatly confirmed and increased the respect entertained for him, such was still the lustre of a title with which were associated recollections of all the greatness of the Roman empire. A scheme for the union of the newly revived

empress, raised by reason of Irene's overture. After this, C. still extended and confirmed his conquests both in Spain and in Germany. He laboured to bring the Saxons to a general reception of Christianity, and founded bishoprics for this purpose. To the end of his reign, he was incessantly engaged in wars, and insurrections were always apt to break out in the frontier parts of his dominions; which he endeavoured to secure, however, not only by military power and arrangements, but by improvements in political and social institutions. His views were liberal and enlightened to a degree rare for many subsequent ages. Whilst he made the power of the central government to be felt to the utmost extremities of his empire, he recognised in his subjects civil rights, and a limitation of monarchic power by their assemblies. He zealously endeavoured to promote education, agriculture, arts, manufactures, and commerce. He projected great national works, one of which was a canal to connect the Rhine and the Danube; but he deemed nothing beneath his attention which concerned the interests of his empire or of his subjects. He required his subjects to plant certain kinds of fruit-trees, the cultivation of which was thus extended northward in Europe. His own domains were an example of superior cultivation. He had a school in his palace for the sons of his servants. He built sumptuous palaces, particularly at his favourite residences, Aix-la-Chapelle and Ingelheim—for he had no fixed capital—and many churches. Learned men were encouraged to come to his court. He himself possessed an amount of learning unusual in his age; he could speak Latin and read Greek. He attempted to draw up a grammar of his own language. C. was of more than ordinary stature, and of a noble and commanding appearance. He was fond of manly exercises, particularly of hunting. He was too amorous, but in eating and drinking he

Crown of C., now at Vienna  
which he had built there. He was succeeded by his son Louis, styled Louis le Débonnaire, the only one of his sons who survived him; but the greatness of his dynasty terminated with his own life. C. is styled Charles I in the enumeration both of the French kings and of the German or Roman emperors. Besides his *capitularies* (q. v.), there are extant letters and Latin poems ascribed to him. His life was written by his secretary, Egihard.

CHARLEROI, a Belgian town and fortress in the province of Hainaut, stands on the Sambre, between Mons and Namur, on the line of the Brussels and Namur railway. The population is 13,000, who carry on considerable manufactures in hardware, glass, woollen-yarn, &c. The district is rich in coal, and the number of smelting-furnaces and nail-factories in the neighbourhood is very great. The ironworks of Couliers, which yield a third of all the cast iron produced in Belgium, lie within a mile or two of the town. C. possesses considerable historical and political interest as a fortress. The fortifications were begun by the Spaniards in 1666, but falling into the hands of the French next year, they were completed by Vauban. After six exchanges of masters between the French and Spaniards, the Peace of Aix-la-Chapelle, 1748, left C. in the possession of Austria. In 1794, after

766

fortifications were demolished. The importance of the place in a strategic point of view having become apparent during the campaign of 1815, the fortifications have been since restored.

CHARLES, surnamed MARTEL—*i. e.*, the Hammer—was the son of Pepin of Herstal, mayor of the palace under the last Merovingian kings, and was born about 690 A.D. After his father's death in 714, he was proclaimed mayor of the palace by the Austrasian party. King Chilperic and he now quarrelled, and a civil war arose, which ended in C. becoming undisputed mayor of the palace and ruler of the Franks. During the latter years of his life, he indeed allowed the nominal throne to remain occupied—the titular kings being mere puppets in his hands. He was much engaged in wars against the revolted Alemanni and Bavarians, the Saxons, &c., but his importance as a historic personage is chiefly due to his wars against the Saracens, who, having conquered Septimania from the Western Goths in 720, advanced thence into Aquitaine, conquered Bordeaux, defeated the Duke of Aquitaine, crossed the Garonne, advanced to the Loire, and threatened Tours. C. defeated them between Tours and Poitiers in 732, in a great battle, in which their leader, Abd-ur-Rahman, fell, and a stop was put to their progress in Europe, which had filled all Christendom with alarm. He defeated them again in 738, when they had advanced in the Burgundian territories as far as Lyon; deprived them of Languedoc, which he added to the kingdom of the Franks; and left them nothing of their possessions north of the Pyrenees beyond the river Aude. He died on 22d October 741, at Quiercy on the Oise, in the midst of his victories, his projects, and his greatness, leaving the government of the kingdom to be divided between his two sons—Carloman, and Pepin the Short.

CHARLES, Archduke of Austria, third son of the Emperor Leopold II, was born at Florence, 5th September 1771. Whilst yet a youth, he pursued military studies with much ardour; and after having greatly distinguished himself as a general in inferior commands, he was intrusted, in 1796, with the chief command of the Austrian army on the Rhine. He fought with great success against Moreau at Rastadt, defeated Jourdan in several battles, drove the French over the Rhine, and concluded his victories by taking Kehl in the winter. In 1799, he was again at the head of the army on the Rhine, was several times victorious over Jourdan, protected Swabia, and successfully opposed Massena. In 1800, bad health compelled him to retire from active service; but being appointed governor-general of Bohemia, he formed a new army there. After the battle of Hohenlinden, he was again called to the chief command, and succeeded in staying the rapid progress of Moreau, but almost immediately entered into an armistice with him, which was followed by the peace of Luneville. In 1805, he commanded the army opposed to Massena in Italy, and fought the hard battle of Caldiero; but upon bad tidings from Germany, retreated from the left bank of the Adige to Croatia. This retreat was one of his greatest military achievements. In 1809, he won the great battle of Aspern, which first shewed to Europe that Napoleon was not invincible; but he did not promptly enough follow up his victory, and Napoleon, who hastened to reinforce his army, retrieved his fortunes at Wagram, and the archduke was now compelled to give way before the enemy, till he reached Znaim, where an armistice was concluded on 12th July. In the campaigns of 1813 and 1814

he had no part; and lived in retirement till his death, 30th April 1847.

**CHARLES I.**, king of England, Scotland, and Ireland (1625—1649), was born at Dunfermline, 19th November 1600, and was the second son of James I. of England (VI. of Scotland). On the death of his elder brother, Henry, in 1612, he became Prince of Wales, and heir-apparent to his father's throne; to which he succeeded in 1625, but found both in England and Scotland a contest in progress between king and people. He had inherited from his father the most extreme notions of kingly prerogative, and he mistook the general movement in the public mind for an agitation amongst a few disaffected persons. He had deeply imbibed his father's notion, that an Episcopal church was the most consistent with the proper authority of kings; and he adopted severe and persecuting measures against the Puritans in England and the Presbyterians in Scotland. He married a Roman Catholic, Maria Henrietta of France; a marriage most displeasing to the nation; and even so far despised public opinion as to make his father's favourite, the Duke of Buckingham, his prime minister and chief adviser. The English parliament, which he assembled in 1625, was resolved upon the vindication of the national liberties, and was therefore very sparing in its grants of subsidies, while that of 1628, instead of freely granting supplies, resolved upon the impeachment of Buckingham; whereupon the king threw into prison two of the boldest members, Elliot and Digges; dissolved parliament; and, to procure money, had recourse to the arbitrary measures of forced loans, and a tax upon the seaports (*ship-money*), imposed by the mere exercise of royal authority. By all this, public feeling was more and more embittered. In 1628, C. found it necessary again to summon a parliament; and the parliament, very resolute to maintain the liberties of the nation, presented the petition known in history as the *Petition of Right* (q. v.). C. temporized, conceded, and finally, although the assassination of Buckingham had removed one cause of strife, assumed a threatening tone, and dissolved the parliament, 10th March 1629. He even caused some of the leading members of the House of Commons to be imprisoned. He now governed for eleven years without a parliament, having Laud (q. v.) and Strafford (q. v.) for his chief advisers, and obtaining for his edicts the semblance of a legal sanction by means of the Star Chamber (q. v.). All this while, the storm was gathering, the love of liberty increased, and republican principles were developed and extended. The policy which C. adopted was that of more severe repression. At length, in 1638, Scotland assumed an attitude of determined resistance to the imposition of a liturgy and of Episcopal church-government. The National Covenant (q. v.) was subscribed, Presbyterianism was completely restored; and in 1639, the king having assembled an army for the purpose of reducing Scotland to subjection, the Scottish Covenanters also took up arms, and advanced to the English border, many of the English regarding their approach with joy. Civil war was, however, prevented for the time, by concessions on the part of the king. Unable to do without supplies any longer, C. summoned an English parliament in 1640, which, instead of listening to his demands, began to draw up a statement of public grievances. C. soon dissolved the parliament, and assembled an army to resist the Scots, who had again taken up arms and entered England; but his army was defeated by them at Newburn-upon-Tyne, and they advanced southward, with the sympathy and good-wishes of no small part of the king's English subjects. Much against his will, C. was now compelled again to

call a parliament, whose memorable sittings began on 3d November 1640. Both Houses were resolute in their opposition to his despotism. They began by the impeachment of the ministers and high officers of state, and declared the decrees of the Star Chamber and Court of High Commission to be null and void. They passed a bill in favour of triennial parliaments; and the king, in trepidation, gave it his assent. He also consented, although against his own convictions, to the execution of Strafford; and even gave his assent to an act which provided that the present parliament should not be dissolved, prorogued, or adjourned, without its own consent. Hoping to win the favour of the Scots, he now visited Scotland; but whilst he was there, a rebellion broke out in Ireland, accompanied with a fearful massacre of Protestants. The prospect of a peaceful accommodation was now almost destroyed; the English parliament enlarged its demands; the king, after seeming to yield, took the extraordinary step of suddenly, on 4th January 1642, appearing in the House of Commons, accusing five members—Pym, Hampden, Hollis, Hazelrig, and Stroud—of high treason, and demanding that they should be delivered up to him. Both Houses of parliament espoused their cause, and the city of London shewed a determination to defend them by arms. C. left London with his family, and the parliament declared the kingdom in danger. Civil war began; the royalists had at first the advantage, but the national feeling was with the parliament. Negotiations were from time to time opened or renewed, but always in vain. After the battle of Naseby, on 15th June 1645, in which his army was almost annihilated by the parliamentary troops under Fairfax and Cromwell, C. was compelled to seek refuge in the Scottish camp. Negotiations still proving fruitless, he was delivered up to the English parliamentary army. Negotiations were still attempted with C. in his captivity; but resulted in nothing. Finally, C. fled, was taken, refused the ultimatum of the army, and so enraged Cromwell and the Independents, that parliament was obliged to pass an act declaring all negotiation with the king to be treason. The Presbyterians of England and the Scots, who were always haunted by the idea that there was something sacred and inviolable in monarchy, thought to rescue the king from the hands of the Independents, but were defeated, and all the Presbyterians were forcibly expelled from the English House of Commons, which now consisting only of about 60 members—the *Rump parliament*—appointed a court composed of persons from the army, the House of Commons, and the city of London, to try the king. The court was opened with great solemnity in Westminster Hall on 20th January 1649. About 70 members took part in its proceedings. On the 27th of January, C. was condemned to death as a tyrant, murderer, and enemy of the nation. The Scots protested, the royal family entreated, and the court of France and States-General of the Netherlands interceded, but in vain. On 30th January 1649, he was beheaded in front of the palace of Whitehall. In his last hours he shewed great calmness and presence of mind. In his private character, C. was a man of cultivated mind, kind, and of irreproachable life; but in political affairs he was unscrupulous, and had recourse to dissimulation and falsehood for the accomplishment of his purposes. In the estimation of many who do not condemn it on moral grounds, his execution was a great political blunder. From the restoration of Charles II., the 30th of January was observed in the Church of England with special religious services, as the day of *King Charles the Martyr*. This commemoration,

offensive to great part of the community, and of the members of the Established Church itself, was abolished by act of parliament in 1859.

CHARLES II., king of England, Scotland, and Ireland (1649—1685), the eldest son of Charles I., was born 29th May 1630, and went with his mother to France during the civil war. He was at the Hague at the time of his father's execution, and immediately assumed the title of king. He meditated an expedition to Ireland for the assertion of his claims, when the Scots offered him their crown in 1650, and proceeding to Scotland, he was crowned at Scone in the beginning of 1651. The limitations, however, under which he received the crown, were disagreeable to him, and he hated the restraint put upon his inclinations by the Presbyterian clergy. After the defeat of the Scots at Dunbar, he put himself at the head of their army, in hope of rousing the royalists of England to his support; but was completely defeated by Cromwell, at Worcester, on 3d September 1651. He made his escape, amidst many dangers, to France, where his situation was by no means agreeable, and from which he went to Cologne, and afterwards to the Netherlands. After Cromwell's death, the desire of the English for a settled government leading to the restoration of the House of Stuart, he landed at Dover, on 26th May 1660, was received with acclamation by the people, and ascended the throne almost untrammelled by a single condition. He was surrounded by men of extreme party-feeling, among whom the most influential was the chancellor, Clarendon (q. v.). The persons immediately concerned in the death of Charles I. were brought to the scaffold; Episcopacy was restored; and the Presbyterians and other Nonconformists, both in England and Scotland, were subjected to great hardship and persecution. The king was extravagant, and soon found himself in want of money: he married the Princess Catharine of Portugal, for the sake of her large dowry; he shamefully sold Dunkirk and Mardyke to the French; and for a pecuniary consideration, agreed to make war against the United Provinces, although such a war was contrary to all the feelings of the English people and the interests of English commerce. The Dutch fleet, under De Ruyter, entered the Thames, and C. was compelled to make an ignominious peace. After the fall of Clarendon, the ministry known as the Cabal (q. v.) ministry came into power—a ministry hateful to the country, composed of unprincipled men, and bent upon the restoration of Popery and absolute monarchy. C. sought to conciliate the people by the *Triple Alliance*, in May 1668, with Sweden and the States-General; but the French court soon found means to persuade him again to make war against the United Provinces. He basely accepted pecuniary gifts and a pension from the French government; and, as even this, with all that he could get from his parliament, was insufficient for his expenses, he had recourse to illegal means of raising money. The story of the *Popish Plot* (q. v.) against the life of the king caused prodigious excitement amongst the people, and Lord Stafford and many other persons were most unjustly brought to the scaffold. The parliament of 1679, very much against the will of the court, enacted the celebrated *Habeas Corpus Act* (q. v.); and a bill was under consideration for the exclusion of the king's brother, the Duke of York, from the throne, on account of his avowal of the Roman Catholic religion. The king, at this period of his reign, had, however, completely crushed the Presbyterians of Scotland, and was more absolute than any of his predecessors had been on either of the British thrones. Most arbitrary measures were adopted. The city of London was deprived of its privileges, because of the election

of a sheriff disagreeable to the court. The *Rye-House Plot* (q. v.), a widely extended conspiracy, and in which the king's natural son, the Duke of Monmouth (q. v.), was concerned, was discovered in 1683, and cost the lives of a number of persons, amongst whom were Lord Russell and Algernon Sidney. C., however, appears to have recognised the necessity of a more liberal policy, when he was unexpectedly carried off by death, on 6th February 1685. In his dying hours, he called in the assistance of a Roman Catholic priest, although he had not previously avowed his attachment to that religion. His reign was full of events dishonourable to his country, and of which he himself was generally the cause. His life was most dissolute; his adulteries, and the profligacy of his court, scarcely paralleled in British history. He had an affability, however, which won for him a certain sort of popularity.

CHARLES V., surnamed the Wise, king of France (1364—1380), was the son of King John, and was born on 21st January 1337. His father being made prisoner by the English at the battle of Poictiers, on 19th September 1356, he assumed the regency. The most significant events which occurred under his rule, were the vigorous efforts of the *bougeoisie* to deliver themselves from the tyranny of the nobles and the court, and the peasant war called the *Jacquerie* (q. v.). His father dying, 8th April 1364, C. ascended the throne, and by his cautious policy rescued the kingdom from some of its troubles, and re-established the power of the crown, which had been much shaken. War with England raged for a number of years, but with results highly favourable to C., who stripped his enemies of all their conquests in France, except a few fortified places. He died 16th September 1380. C. was fond of books and the company of learned men, but was not above the natural weakness of kings for outward pomp and magnificence.

CHARLES VI., king of France (1380—1422), born at Paris, 3d December 1368, was the son and successor of Charles V. He was only 13 years of age when his father died. For several years, his uncle, the Duke of Anjou, acted as regent. In 1388, C. took the reins of government into his own hand, but during his lifetime was so often afflicted with insanity, that party-strife raged without much check. The two great families whose influence divided the nation, were those of Orleans and Burgundy. It was the Orleans party which called in the assistance of the English, and brought about the battle of Agincourt, so disastrous to the French nation. Subsequently the Burgundians allied themselves to the English, who laid waste the whole of northern France. In the midst of these calamities, C. died 21st October 1422.

CHARLES VII., king of France (1422—1461), the son and successor of Charles VI., was born on 22d February 1403. On his father's death he was at the head of an army, with which he held possession of the southern provinces of the kingdom; Paris and the north being in the hands of the English, who proclaimed Henry VI. of England king of France, and appointed the Duke of Bedford regent. For some time the events of war were unfavourable to C., who was compelled, in 1424, to evacuate Champagne, and, in 1425, Maine. In 1426, the Count Dunois gained the first victory over the English at Montargis; but in the year following they besieged Orleans, a place of great importance to C., as securing a connection with the north, and he was roused to fresh energy. At this time, also, Joan of Arc (q. v.), the Maid of Orleans, by her wonderful courage and confidence of a heavenly mission, roused the fervour both of nobles and people. The siege of

## CHARLES VIII.—CHARLES IV.

Orleans was raised in May 1429; the English retired disheartened, and gradually lost their acquisitions in France. A treaty between the French king and the Duke of Burgundy greatly advanced the French cause. In 1436, C. entered Paris; and during the further progress of the war, the English lost all their strongholds except Calais. In 1452, they were finally defeated at Castillon. After he was established on his throne, C. devoted himself to the reorganization of the government, in which everything had fallen into confusion, but shewed a strong anxiety to frame it according to a scheme of perfect despotism, and for this purpose to provide himself with a powerful and well-disciplined standing army, which caused some discontentment among the nobles of his kingdom. His government, however, was mild, and under it France recovered in some measure from the effects of the terrible calamities which it had endured. His last years were embittered by the conduct of his son, the Dauphin, afterwards Louis XI.; and his apprehension that his son would poison him was so strong, that his consequent abstinence from food is supposed to have hastened his death, which took place at Melun on 22d July 1461.

**CHARLES VIII.**, king of France (1483—1498), was born at Amboise on 30th June 1470, and succeeded to the throne on the death of his father, Louis XI. For some time the government was carried on under the regency of his sister, Anne of Beaujeu. When C. attained his twenty-first year, he took the royal power into his own hand, and soon developed a bold and ambitious spirit. The most important incident of his career was his conquest of Naples in 1495, to the throne of which he believed he had a claim. The Italian princes and other European potentates were alarmed by his success. A league was hastily formed between the pope, the emperor of Germany, Ferdinand of Spain, the republic of Venice, and Sforza, Duke of Milan, to oppose his return to France. C., however, gallantly broke through the allied forces near Piacenza, and effected a retreat to his own country. It was with difficulty he was hindered by his councillors from resuming his warlike designs on Italy. C. is also said to have meditated the expulsion of the Turks from Europe, and making himself emperor of Constantinople; having received from Andreas Palaeologus, the grandson of the last Grecian emperor, a transference of his claims to the Byzantine throne. He died 7th April 1498.

**CHARLES IX.**, king of France (1560—1574), the second son of Henry II. and of Catharine de' Medici (q. v.), was born at St Germain-en-Laye on 27th June 1550, and on 5th December 1560 succeeded to the throne on the death of his brother, Francis II. His character was a compound of passion, acuteness, heartlessness, and cunning. Although only 24 years of age when he died, so well had his detestable mother trained him to a love of perfidy and cruelty, that he found time, with her assistance and that of the Guises, to perpetrate an act so hideously diabolical, that all civilised Europe still shudders at the recollection. The massacre of St Bartholomew's (q. v.), 24th August 1572, was the culmination of a series of treacheries towards the Huguenots, which disgraced his reign. The result was, that civil war broke out anew, and assumed a very threatening character, as political malcontents associated themselves with the Protestants. C. died May 30, 1574.

**CHARLES X.**, king of France (1824—1830), third son of the Dauphin Louis, and grandson of Louis XV., was born at Versailles, 9th October 1757. He received the title of Count d'Artois, and in 1773 married Maria Theresa of Savoy. After

the events of 14th July 1789, he and the Prince of Condé took the lead in the emigration. In 1796, he sailed from England with a squadron under Commodore Warren, on an expedition to the western coasts of France, whereupon twenty departments rose in insurrection; but he had not courage to land and place himself at the head of the insurgents, whom he basely left to the vengeance of the republicans. Detested now by the royalists of France, and despised by the British, he lived in obscurity until the allies entered Paris in 1814, when he appeared in France as lieutenant-general of the kingdom, and issued a proclamation announcing the end of despotism, of conscriptions, and of oppressive taxes. After the second restoration, he took little open part in politics, but lived surrounded with priests, Jesuits, and nobles of the old school; and in this circle originated the tyrannical and unconstitutional measures to which even Louis XVIII. made considerable opposition, but which at this time disgraced the government of France. The death of Louis, on 16th September 1824, brought C. to the throne. He took the oath of adherence to the charter, but soon displayed his intention of restoring as much as possible the absolutism of the old French monarchy. Popular discontent rapidly increased. A royal speech, of a threatening character, on 2d March 1830, was followed by an address of remonstrance, signed by 221 deputies, upon which the king dissolved the chamber. The deputies who signed the address were all re-elected, but the court taking fresh courage from the success of the expedition to Algiers, the celebrated ordinances of 25th July were signed by the king, putting an end to the freedom of the press, already largely curtailed, appointing a new mode of election, and dissolving the recently elected chamber. The capital took up arms, the guards refused to act, and the king soon found himself compelled to flee. As a last resource, he abdicated the throne, on 2d August 1830, in favour of his grandson, Henry, Duke of Bordeaux; the Dauphin also consenting to this act. But it was too late; the revolution was accomplished, and Louis Philippe, Duke of Orleans, was chosen king of the French. C. made his escape to England, resided for some time at Holyrood, and afterwards at Prague. He took no part in the political intrigues and attempts of the Duchess de Berri. He died of cholera at Görz, on 6th November 1836. His only surviving descendant, in the male line, is his grandson, the Count of Chambord (q. v.).

**CHARLES IV.**, German emperor (1346—1378), was born at Prague in 1316, and was the son of King John of Bohemia, of the House of Luxembourg, who fell in the battle of Crecy. At the instigation of Pope Clement VI., to whom he had previously taken an oath of humiliating submission at Avignon, he was elected emperor by a portion of the electors on 11th July 1346, although Louis IV. then actually filled the imperial throne. But even after the death of Louis, it was not without difficulty that he obtained secure possession of it. He was crowned king of Italy at Milan in 1354, and emperor at Rome in 1355. In 1356, he issued the Golden Bull (q. v.), the fundamental law concerning the election of German emperors; in defiance of the very letter of which he afterwards, by large bribes, secured for his own son, Wenceslaus, the succession to the empire. He died at Prague, 29th November 1378. C. was an artful politician, but destitute of true greatness. He sought the support of the clergy by undue concessions, sold rights and privileges in Italy and other parts of the empire for money, and cared chiefly for the prosperity of his hereditary kingdom of Bohemia.

son of Philip, Archduke of Austria, and of Joanna, the daughter of Ferdinand and Isabella of Spain. Philip's parents were the Emperor Maximilian and Maria, daughter and heiress of Charles the Bold, Duke of Burgundy. On the death of his grandfather, Ferdinand, in 1516, C. took possession of the throne of Spain by the title of Charles I., his mother Joanna being of disordered intellect and incapable of reigning. He was not, however, very favourably received by the Spanish nobles, who were doubtful of his right, and jealous of the followers whom he brought from the Low Countries, where he had been educated. All the abilities of his famous minister Ximenes (q. v.) were requisite to prevent an open revolt. On the death of Maximilian in 1519, C. was elected German emperor from amongst a number of competitors, chiefly through the influence of the Elector Frederic of Saxony. In his earlier years he had been frivolous and dissolute, but he now became mindful of the duties and dignity of his high position. On 22d October 1520, he was crowned at Aix-la-Chapelle, and received from the pope the title of Roman emperor. He ascended the imperial throne at a time when Germany was in a state of unprecedented agitation concerning the doctrines proclaimed by Luther. To restore tranquillity, a great diet was held at Worms in 1521, Luther's declaration of his principles before which forms a well-known and important passage in the history of the Reformation. In 1522 he reduced to subjection the towns of Castile, which had leagued themselves together for the maintenance of their ancient liberties. He was likewise successful in his war against the Turks under Solyman the Great. C. was involved also in a struggle of long duration with France, in which, after many alternations of fortune, his armies at last drove the French from the greater part of their conquests in Italy; and Francis I. of France fell into his hands as a prisoner, after a battle by which the siege of Pavia was raised on 24th February 1525.

The pope, however, began to grow alarmed at his victories, and therefore allied himself with France and the principal Italian states, and released the king of France from the obligations under which he had come by his treaty with Charles. It was the pope's object to exclude C. from all dominion in Italy; but the emperor's forces under Charles of Bourbon, the former Constable of France, took Rome itself by storm, plundered it, and made the pope prisoner. C. pretended great regret for this, went into mourning with all his court, and caused prayers to be said for the pope's liberation, whilst by his own directions the pope was kept for seven months a captive. Peace was concluded in 1529, on terms most favourable for the emperor. He now thought to put an end to the religious differences in Germany, and to repel the Turks, who had overrun Hungary and laid siege to Vienna. But the Diet at Augsburg in 1530, proved how vain was the hope of restoring the former state of things in Germany; and the emperor refusing to recognise the confession of the Protestants, they refused to help him against the Turks. In 1531, the Protestant princes formed the League of Smalcald (q. v.), and allied themselves with France and England for their own protection. This, and the contained assaults of the Turks, compelled the emperor to yield in some measure to the demands of the Protestants. In 1535, C. undertook an expedition from Spain against the pirate Barbarossa, who had established himself in Tunis, and whose vessels did prodigious injury to the commerce of Spain

710

Christians, who had been held as slaves. War again broke out with France; an armistice for ten years was concluded in 1538; and C. even visited Paris, where he was magnificently entertained. But the war broke out afresh in 1542, and terminated in favour of the emperor; who also triumphed in the battle of Mühlberg, 25th April 1547, over the Protestant princes of Germany, and deprived the Elector John Frederic of Saxony of his territories. But he shewed so plainly his intention of converting the German empire into a hereditary possession of his family, that new opposition arose, and C. was compelled to flee before the arms of Duke Maurice of Saxony and the Protestants, and in 1552 to promise them the peaceful exercise of their religion, which was confirmed by the Diet at Augsburg in 1555. Henry II. of France also took from C. some parts of Lorraine. His health failing, C. now declared, in an assembly of the States at Louvain, his resolution to seek repose, and devote the remainder of his days to God. He resigned the government of his dominions to his son, for whom, however, he vainly sought to secure the imperial throne; and having relinquished to him the crown of Spain on 15th January 1556, he retired to the monastery of Yuste, in Extremadura, where he spent two years partly in mechanical amusements, partly in religious exercises, which are said to have assumed a character of the most gloomy asceticism, and died on 21st September 1558. By his wife Isabella, daughter of King Emmanuel of Portugal, he had one son, his successor, Philip II. of Spain, and two daughters. His brother Ferdinand succeeded him in the empire.

CHARLES VI., German emperor (1711-1740), the last of the proper male line of the House of Hapsburg, was the second son of the Emperor Leopold I., and born 1685. His father intended for him the crown of Spain; but Charles II. of Spain, yielding to French intrigues, assigned it by testament to Philip of Anjou, whereupon arose the great war of the Spanish succession—Britain and Holland taking part with the emperor against France, for the maintenance of the balance of power in Europe. C. was acknowledged by the allies as Charles III. of Spain, but had not succeeded in obtaining permanent possession of the kingdom, when the death of his brother, the Emperor Joseph I., recalled him to Germany in 1711; and as he now became emperor of Germany, Britain and Holland concluded the Peace of Utrecht with France in 1713. C. continued the war for some time longer; but was at last obliged to give up his claim to Spain, being confirmed, however, in possession of the Spanish Netherlands and of the Spanish possessions in Italy. Success attended his arms in a war against the Turks, and in a war with Spain, which arose out of the projects of the Spanish minister Alberoni, and in which the *Quadruple Alliance* was formed—France, Britain, and Holland joining the emperor against Spain. But C., having lost his only son, and being very anxious to secure the throne to his own descendants, named his daughter, Maria Theresa (q. v.), as his heiress, by a *Pragmatic Sanction* (q. v.), to which he had much difficulty in obtaining the consent of some of the German states and some foreign powers; and to accomplish this object he gave up Tuscany, Parma, and Piacenza, and afterwards Naples, Sicily, Lorraine, and some parts of Milan. Meanwhile, he was unsuccessful in wars with France and Spain, and with the Turks, who compelled him, in 1739, to resign his former conquests. He died 20th October 1740. He was of a

## CHARLES VII.—CHARLES XIV.

mild and benevolent disposition, but full of superstition and of prejudices in favour of feudalism and ecclesiastical domination.

**CHARLES VII.**, German emperor (1742—1745), was born at Brussels in 1697, and was the son of Maximilian Emmanuel, Elector of Bavaria, and for some time governor of the Spanish Netherlands. After the conquest of the Bavarian territories, and the pronouncement of the ban of the empire against his father by the Emperor Joseph I., he was for some time the emperor's prisoner; but after the decease of Joseph, he married his youngest daughter; and having, in 1726, succeeded his father as Elector of Bavaria, refused his consent to the Pragmatic Sanction (see preceding article); and on the death of Charles VI. in 1740, advanced a claim to the Austrian dominions in right of his wife, and upon the further ground of a testament of Ferdinand I. Success at first attended his arms; he was acknowledged as Archduke of Austria, and then as king of Bohemia, upon which he was also, in 1742, elected emperor. But the tide of fortune now turned against him. The Hungarians rose in favour of Maria Theresa, and he was driven from Austria and from Bohemia, and for a time even from his Bavarian capital, Munich. Disease and calamities combined to cause his death, 20th January 1745, shortly before which he said, ‘Misfortune will never leave me, till I leave it.’

**CHARLES XII.**, king of Sweden (1697—1718), was the son of Charles XI., and was born at Stockholm on 27th June 1682. On the death of his father in 1697, he ascended the throne, and notwithstanding his youth, the States declared him of age to assume the reins of government. The neighbouring powers thought this a favourable time to humble Sweden, then the great power of the north; and Frederick IV. of Denmark, Augustus II. of Poland, and the Czar Peter I. concluded a league for this object. The Danes began by invading the territory of the Duke of Holstein Gottorp, who had married C.'s eldest sister, and who applied to him for assistance. The young king immediately resolved on the most active measures, and approached Copenhagen with such a force as presently compelled the Danes to make peace. C. now hastened to meet the Russians; and although they lay in an intrenched camp beneath the walls of Narva, 50,000 strong, he stormed their camp on 30th November 1700, with 8000 Swedes, and defeated them with great slaughter. He next dethroned Augustus II., and procured the election of Stanislaus Leszczynski as king of Poland. Augustus supposed himself safe at least in Saxony, his hereditary dominion, but was followed thither, and humbling terms of peace were dictated at Altranstadt in 1706. C. obtained from the emperor liberty of conscience for the Protestants of Silesia. Leaving Saxony with an army of 42,000 men in September 1707, he proposed to advance direct upon Moscow; but at Smolensk he was induced, by the representations of the Cossack *hetman*, Mazepa, to change his plan and proceed to the Ukraine, in hope of being joined by the Cossacks. In this hope, however, he was disappointed, and after enduring many hardships, he was defeated by the Russians at Pultowa, on the 27th June 1709, and fled to Bender in the Turkish dominions.

Augustus II. now revoked the treaty of Altranstadt, and the czar and the king of Denmark assailed the Swedish territories. But the regency in Stockholm adopted measures of effective and successful resistance, and C. prevailed with the Porte to declare war against Russia, in which Peter seemed at first likely to have suffered a severe

defeat. But Russian agents succeeded in inspiring the Turks with suspicions concerning the ultimate designs of C., who was conveyed to Adrianople, but after some time escaped, and made his way through Hungary and Germany, pressing on by day and night with extraordinary speed, till he reached Stralsund, where he was received with great joy, on 11th (22d) November 1714. He was soon, however, deprived of Stralsund by the allied Danes, Saxons, Prussians, and Russians. After he had adopted measures for the security of the Swedish coasts, his passion for war led him to attack Norway. Success appeared again to attend his arms, when, in the siege of Friedrichshald, on 20th November 1718, he was killed by a musket-bullet. On his death, Sweden—exhausted by his wars—ceased to be numbered among the great powers. He was a man capable of comprehensive designs, and of great energy in prosecuting them. His abilities appeared not merely in military affairs, but in his schemes for the promotion of trade and manufacture. His self-willed obstinacy, however, amounted almost to insanity; in fact, he has been termed ‘a brilliant madman.’ His habits were exceedingly simple: in eating and drinking, he was abstemious; and in the camp, he sought no luxuries beyond the fare of the common soldier.

**CHARLES XIII.**, king of Sweden (1809—1818), born October 7, 1748, was the second son of King Adolphus Frederic, and of the sister of Frederic the Great of Prussia. He was trained for naval command, and was long the High Admiral of Sweden, in which capacity he distinguished himself by a great victory over the Russians in the Gulf of Finland in 1788, and by bringing back his fleet safe to Karlskrona in the most perilous season of the year. He was on several very important occasions called to an active part in political affairs—in the revolution of 1772, when he was made governor-general of Stockholm and Duke of Södermanland; after the assassination of his brother Gustavus III. in 1792, when he was placed at the head of the regency; and after the revolution of 1809, when he became administrator of the kingdom, and subsequently king. The Swedish monarchy now became limited instead of despotic. Having no child, C. concurred with the States of the kingdom in choosing as his successor the French general, Bernadotte, who became crown-prince of Sweden, and ascended the throne on the death of C., February 6, 1818. The prudence of the king and crown-prince secured the union of Norway with Sweden in 1814, as a compensation for Finland.

**CHARLES XIV.**, king of Sweden and Norway (1818—1844), originally JEAN BAPTISTE JULES BERNADOTTE, was born at Pau, in the south of France, January 26, 1764. He was the son of a lawyer. He entered the French army as a common soldier; became an ardent partisan of the revolution; greatly distinguished himself in the wars of Napoleon, and soon attained the highest military rank. But he was distrusted by Bonaparte, whose ambitious schemes he took no part in promoting; and Napoleon having taken offence at his conduct after the battle of Wagram, Bernadotte left the army in disgust, and returned to Paris. He was afterwards sent by the ministerial council to oppose the British, who had landed at Walcheren, but the breach between the emperor and him grew wider. In 1810, he was elected crown-prince, and heir to the throne of Sweden. Almost the only condition imposed on him was that of joining the Protestant church. He changed his name to Charles John; and the health of the Swedish king, Charles XIII., failing in the following year, the

Napoleon, which were opposed to the interests of Sweden, particularly as to trade with Britain, and was soon involved in war with him. He commanded the army of the allies in the north of Germany, and defeated Oudinot at Grossbeeren, and Ney at Dennewitz. He shewed great reluctance, however, to join in the invasion of France, and was tardy in his progress southward.—He became king of Sweden on the death of Charles XIII., February 5, 1818. He won for himself the character of a wise and good king. Education, agriculture, manufactures, commerce, and great public works, as well as the military strength of the kingdom, were promoted by his care. He died March 8, 1844, and was succeeded by his son Oscar.

CHARLES ALBERT, king of Sardinia (1831—1849), born 2d October 1798, was the son of the Prince Charles Emmanuel of Savoy-Carignan, and in 1800, succeeded to his father's title and estates in France and Piedmont. In 1817, he married Maria Theresa, daughter of the Archduke Ferdinand of Tuscany. When the revolutionary movement took place in Piedmont in 1821, he was made regent, upon the abdication of Victor Emmanuel, until Charles Felix, the brother of the late king, should arrive to assume the sovereignty. He displeased both the liberal party and their opponents, and Charles Felix disallowed all his acts, and for some time forbade his appearance at court. In 1829, he was appointed viceroy of Sardinia. On the death of Charles Felix, 27th April 1831, he ascended the throne. The liberals had great expectations from him, but were for a long time disappointed; his government much resembled the other Jesuitic and despotic Italian governments, except that he sought to promote the interests of the country, and to restrict the influence of the clergy in political affairs. It was not till after the elevation of Pius IX. to the papedom, when a new impulse was given to the cause of reform, that the Sardinian government adopted the constitutional and liberal policy to which it has since adhered. C. A. entered warmly into the project of Italian unity, and evidently expected to place himself at the head of the whole movement and of the new kingdom of Italy. When the Lombards and Venetians rose against the Austrian government, he declared war against Austria, 23d March 1848, and at first was exceedingly successful, but was insufficiently supported by the Lombards, and finally defeated by the Austrians; so that after the fatal battle of Novara, 23d March 1849, he was obliged, for the preservation of the integrity of his kingdom, to resign the crown in favour of his son, the present king, Victor Emmanuel. Retiring to Portugal, he died at Oporto on 28th July of the same year.

CHARLES EMMA'NÜEL I., Duke of Savoy (1580—1630), called the Great, was born at the castle of Rivoli, 12th January 1562, and succeeded his father Emmanuel Philibert in 1580. He married a daughter of Philip II. of Spain, and at first allied himself politically with Spain, and made war against France for the marquisate of Saluzzo (or Saluces), which he obtained in 1601, upon the cession of some other territories to France. But he afterwards joined France and Venice to oppose the preponderant power of Spain in Italy; then allied himself with the House of Hapsburg, and set up a claim to Montferrat, but suffered, in consequence, the direst calamities, great part of his dominions being conquered by the French, and in their hands when he died, 26th July 1630. He was a prince of vast ambition, and for whom no enterprise was too bold.

of Valois, and of Isabella of Portugal, was born at Dijon on 10th November 1435, and bore, during his father's life, the title of Count of Charolais. He was of a fiery, ambitious, and violent disposition. From an early period to the end of his life he was a declared enemy of Louis XI. of France, the nominal feudal superior of Burgundy. Louis having caused Philip to deliver up some towns on the Somme, C. left his father's court, and formed an alliance with the Duke of Bretagne and some of the great nobles of France for the maintenance of feudal rights against the crown. Their forces ravaged Picardy and Isle-de-France, they threatened Paris, and defeated the king at Montlhéry. The result was a treaty by which the Count of Charolais obtained the towns on the Somme and the counties of Boulogne, Guines, and Ponthieu for himself. In 1467, he succeeded his father as Duke of Burgundy. Richer and more powerful than any prince of that time, he conceived the design of restoring the old kingdom of Burgundy, and for this purpose of conquering Lorraine, Provence, Dauphiny, and Switzerland. Whilst he was making preparations for war, Louis invited him to a conference; he hesitated, and Louis by his agents stirred up the citizens of Liege to revolt. Meanwhile C. consented to the conference, and the news coming of what had taken place at Liege, he seized the king, and if he had not been withheld by his councillor Comines, would have put him to death. He compelled Louis, however, to accompany him to Liege, and apparently to sanction the cruelties which he inflicted on the citizens. War raged between them afterwards with little intermission, till 1475. In September of that year, C. found himself at leisure to attempt the prosecution of his favourite scheme of conquest, and soon made himself master of Lorraine. In the following year he invaded Switzerland, stormed Grandson, and hanged and drowned the garrison; but was soon after terribly defeated by the Swiss near that place, and lost his baggage and much treasure. Three months after, he appeared again in Switzerland with a new army of 60,000 men, and laid siege to Morat, where he sustained, on June 22, 1476, another and more terrible defeat. After this he sank into despondency, and let his nails and beard grow. But the news that the young Duke René of Lorraine was attempting to recover his territories, roused him, and he laid siege to Nancy. His army was small; Italian auxiliaries, whom he had hired, went over to the enemy; and in the battle which he too rashly fought, he lost his life, January 5, 1477. His daughter and heiress, Maria, married the Emperor Maximilian I. With his life ended the long successful resistance of the great French vassals to the central power of the monarchy.

CHARLES'S WAIN, a common name for the constellation of Ursa Major (q. v.).

CHARLESTON, the chief city of a district of its own name in South Carolina, and the commercial capital of the state, is situated in lat. 32° 46' N., and long. 79° 57' W. With straight and regular streets, it occupies the fork of the Cooper and the Ashley, which, as deep tideways of the respective widths of 1400 and 2100 yards, here unite with their common estuary of 7 miles in length to form Charleston harbour. This haven is beset to seaward by a sand-bar, which has its uses, however, as a breakwater and a bulwark. The more practicable of its two passages—shewing 16 feet at ebb and 22 at flood—is commanded by Fort Moultrie and Fort Sumter. The city is built upon ground raised but a few feet

## CHARLESTOWN—CHARON.

above the water. In 1850, the population of C. was 42,985; in 1860, 40,522; in 1870, 48,956. The exports, which are always of much greater value than the imports, amounted in 1858 to \$16,924,426; in 1868, to \$9,913,776. The total imports in these years were respectively \$2,071,519 and \$499,300. In 1857, 229,185 bales of cotton were exported to foreign ports; in 1866, 58,824 bales; in 1868, 105,813; in 1872, 88,103 bales. C. was founded in 1672, receiving from France, about 1685, a considerable influx of Protestant refugees. It was prominent for zeal and gallantry in the revolutionary war. Up to the time of the civil war, the city was remarkable for its suburban character and verdant surroundings, and its inhabitants were mainly opulent planters, distinguished for their hospitality and refinement. It was in C., however, that the first open movement was made in favour of secession; and the city and its inhabitants have changed since then. In 1860 and 1861, the harbour was the scene of several conflicts; and in 1863 Fort Sumter was reduced to ruins. The harbour was blockaded in 1861, and several dismantled hulks of vessels were filled with stones and sunk, in order to prevent passage. In spite of these precautions, however, more British blockade-runners entered this than any other southern port. In August 1863, the city was bombarded, and in February 1865 was occupied by the United States troops.

**CHARLESTOWN**, a seaport of Massachusetts, in lat. 42° 2' N., and long. 71° 3' W. It occupies a peninsula about 2 miles long, immediately to the north of Boston, the capital of the state; of which, connected as the two are by bridges, it is virtually a suburb. Pop. in 1850, 17,126; in 1860, 25,063; in 1870, 28,323. In common with the rest of the neighbourhood, the peninsula displays an unevenness of surface which renders the streets otherwise handsome, somewhat irregular. Its most prominent height is Bunker's Hill, celebrated as the first battle-field in the revolutionary war, and surmounted, in 1825—1843, by a granite monument of 220 feet in height. Besides a state-prison on a large scale, the city possesses one of the principal navy-yards of the general government. This establishment, covering 70 or 80 acres, contains a magnificent rope-walk 1300 feet long, and a dry-dock of chiseled granite measuring 80 feet in breadth by 30 in depth, which cost fully 670,000 dollars.

**CHARLET**, NICOLAS TOUSSAINT, a French painter and engraver, born in Paris 1792, was for some years employed as a clerk in a government office, but lost his place at the restoration, 1815, on account of his Bonapartism, and in consequence betook himself to art. After studying awhile under Gros, he gradually formed for himself a style in which he had no rival. C. is the Béranger of caricature, but without the political bitterness and sarcasm sometimes found in the poet. His genial sketches of French life and manners were studied with equal admiration in the salons of the aristocracy and in the ateliers, barracks, taverns, &c., of the lower classes. C. was especially successful in his sketches of soldiers and children. His designs are free from exaggeration, while full of spirit, interest, and naïveté; and his titles or mottoes were often so witty and suggestive, that dramatic writers have founded pieces upon them. His sketches and lithographs are very numerous, and are widely distributed. Among his paintings, the most remarkable are—‘An Episode in the Russian Campaign’ (in the Museum at Versailles); ‘Moresau’s Crossing of the Rhine’ (at Lyon); and a ‘Procession of the Wounded’ (at Bordeaux). C. died in 1845.

**CHARLEVILLE**, a town of France, in the

department of Ardennes, about a mile from Mézières, with which it communicates by a suspension-bridge over the Meuse. It is a thriving place, well built, with clean spacious streets. It has manufactures of hardware, leather, and beer, and the Meuse affords facilities for considerable trade in coal, iron, slate, wine, and nails. Pop. (1872) 11,410.

**CHA'RLOCK**. See MUSTARD.

**CHARLOIS**, a village of the Netherlands, situated on the Maas, about two miles south-west of Rotterdam. It is memorable on account of a terrible accident which occurred here in 1512, when a religious procession crossing the ice in defiance of magisterial prohibition, 8000 of them were precipitated into the Maas. Pop. 2000.

**CHARLOTTE AMALIE**, chief, or rather only, town of St Thomas, one of the Virgin group of the Antilles, in lat. 18° 20' N., long. 64° 58' W. It contains 10,100 inhabitants, nearly three-fourths of the entire population of the colony. It has a spacious harbour, which, besides being largely visited by European ships in general, is a principal station for the mail-packets between Southampton and the West Indies.

**CHARLOTTE TOWN**, the capital of Prince Edward Island, in the Gulf of St Lawrence, in lat. 46° 15' N., and long. 63° 7' W. The census of May 1871 states the population at 8800. The port is the best in a colony which, in proportion to its size, is remarkable for its navigable facilities. The town stands on the south-east coast at the bottom of Hillsborough Bay, and at the confluence of three rivers, which each admit the largest vessels for several miles, so as to secure them from all weather. The harbour is rendered still more commodious through the strength of the tides, which enable ships to work out and in against the wind. C. T. has an iron foundry and a woollen factory, and is largely engaged in ship-building.

**CHARLOTTENBURG**, a town of Prussia, in the province of Brandenburg, is situated on the Spree, 3 miles west of Berlin, with which it is connected by a road leading through the *Thiergarten*, and affording a favourite promenade to the Berliners. C. contains a royal palace, with a fine garden and splendid orangery, and an interesting collection of antiquities and works of art. In a beautiful part of the park a mausoleum, designed by Schinkel, contains the remains of Frederick William III. and his wife, the Queen Luise, with their statues by Rauch. C. has manufactures of cotton and hosiery, and a population, in 1871, of 19,518.

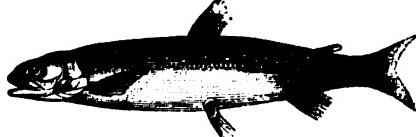

**CHARM** (Lat. *carmen*, a song), properly, a form of words, generally in verse, supposed to possess some occult power of a hurtful, a healing, or a protective kind. Charms exert their influence either by being recited, or by being written and worn on the person; and, in this latter case, they may be classed with Amulets (q. v.). The nature of this superstition will be more fully considered under INCANTATION; see also MAGIC.

**CHA'RNEL-HOUSE** (Fr. *charnier*; Lat. *caro*, flesh), a chamber situated in a churchyard or other burying-place, in which the bones of the dead which were thrown up by the grave-diggers were reverently deposited. The C. was generally vaulted in the roof, and was often a building complete in itself, having a chapel or chantry attached to it. In such cases, the charnel-vault was commonly a crypt under the chapel; and even in churches, it was not uncommon for the vault or crypt to be employed as a charnel-house.

**CHA'RON**, in classical mythology, the son of Erebus and Nox, is first mentioned by the later

under-world. For this service, he exacted an obolus from each, and in consequence, a coin of this kind was placed in the mouth of the dead. If this rite was neglected, C. refused to convey the unhappy shade across, and it was doomed to wander restlessly along the shores of Acheron. C. is generally represented as a gloomy old man, with a rough beard and wretched clothes. In the Etruscan monuments, he holds a hammer.

CHARRE (*Salmo umbra*), a fish of the same genus with the salmon, occurring in the lakes of Britain and of the continent of Europa. It is abundant in the lakes of Cumberland and Westmoreland, and in some of those of Ireland, of the north of Scotland, and of Orkney, but in the greater number of the Scottish lakes it is not found. It is the celebrated *ombre chevalier* of the Lake of Geneva. It is sometimes found weighing more than 2 lbs., but is generally under 1 lb. in weight. It has only the anterior part of the  *vomer* (the middle line of the palate) furnished with the teeth, agreeing in this with the salmon and bull-trout, and differing from the common trout, salmon-trout, &c. The form is elongated, the greatest depth of the fish about one-fifth of the entire length; the fins are rather small; the tail deeply forked; the colour of the back dark olive, the sides lighter and spotted with either red or white, according to the condition in which the fish is at the time, the belly also being sometimes deep orange, and sometimes of a pale colour; these, and other accidental variations, causing the fish to receive different names, such as *Casse C.*, *Red C.*, *Gill C.*, *Silver C.*, and having led some naturalists to believe in the existence of different species. It is not yet quite certain whether the *Torgoch* or *Red-belly* of Wales (*Salmo salvelinus* of some authors) ought to be regarded as distinct or as a mere accidental variety. Whilst it is the most delicious perhaps of the *Salmonidae*, the C. is also the most beautiful; its rich purple, rosy, and crimson tints and white spots rendering it indeed a brilliant and striking object. During summer, the C. haunts chiefly deep cool water, and is seldom seen at the surface till late in autumn. It feeds on insects and minute crustaceans. In the end of autumn or beginning of winter, it ascends rivers to spawn, always choosing those which have a rocky bottom. Whether in lake or stream, it is only to be found in clear waters. Unfortunately, the C. of the English

Charr (*Salmo umbra*).

lakes is taken in great numbers, by nets, at the mouths of streams, when about to ascend them in order to spawn, and when not in the best condition for the table.

On some lakes, vast quantities are then caught for the table, particularly for the purpose of potting. A C. is now and then taken with fly when the angler may be whipping a lake, which perhaps abounds with them, for trout; but this occurs but seldom. The C. will, too, occasionally take a minnow, if sunk deep and trailed slowly; but the sport it affords is of the most precarious nature. C. are fast diminishing in those of our English lakes which they still inhabit, owing to the wholesale

reaching 4 lbs. in weight, is found in some of the more northern Swedish lakes.

CHART, a marine or hydrographical map, exhibiting a portion of a sea or other water, with the islands, coasts of contiguous land, soundings, currents, &c. See MAP. In the English service, when coasts have been surveyed by the Admiralty, charts are engraved, and are sold at various prices, from 3d. down to 6d. each. This price is below their cost, the object being to encourage their general use as much as possible. Men-of-war are supplied with copies of every available C. published, relating to the regions likely to be visited. There is a printed list for every station. At Gibraltar and the Cape of Good Hope, there are dépôts of charts to supply ships whose destination undergoes a change. All the charts are brought home again, and none are reissued until revised and corrected. The navigating charts, shewing the dangers of coasts, with sufficient clearness to enable mariners to avoid them, are generally on the scale of half an inch to a mile; those of larger size shew all the intricacies of the coast. The merchant-service is supplied with charts by agents, who receive a stock from the Admiralty, and keep them on sale. The preparation of charts is part of the duty of the hydrographical department at the Admiralty. In the financial year 1860—1861, a sum of no less than £11,000 was provided for this branch, quite irrespective of the surveying that preceded the engraving of the charts, which always costs a much larger sum. In the five years ending with 1859, the Admiralty sold 290,000 charts, besides supplying the Queen's ships.

CHARTA, MAGNA. See MAGNA CHARTA.

CHARTRE (Fr. a charter; Lat. *charta*, paper). In the sense in which we have adopted this word from the French, and in which it may be now said to form part of our language, it signifies a system of constitutional law, embodied in a single document. Whether any system of positive public law existed in ancient France is, in that country, a subject of keen dispute amongst constitutional antiquaries. If any such there was, there seems little doubt that it was the mere embodiment of traditions, and not the result of any single act of the national will. Whilst France was divided into provinces and communes, local liberties and privileges unquestionably existed; but where the nation constituted no single body, a constitutional charter was impossible. The first traces of such a C. appear in the 14th c.; and it is known in the history of the public law of France as the *Grand Charter*, or the charter of King John. Up to this time, the kings had called together only partial assemblies, but in 1335 deputies from the whole kingdom were assembled in the hall of the Parliament of Paris. The nobility and clergy, secular and regular, were represented by 400 deputies, the commons or third estate by a like number. This body assumed to itself the initiative, and prepared a species of constitution, which was accepted by the king. The chief triumph of the third estate on this occasion consisted in carrying through the doctrine, that the decision of any two estates should be invalid without the concurrence of the third. The three orders, who seem to have composed but one assembly, then proceeded to impose a series of restrictions on the power of the monarch, which, confirmed by the dauphin two years later, formed the foundation for the liberties subsequently asserted at the Revolution.

But the constitution to which the term C. is most frequently applied by the French and by

us, is that in which Louis XVIII. solemnly acknowledged the rights of the nation on his restoration in 1814. This C. has ever since been considered the fundamental law of constitutional monarchy when that form of government has existed in France. In some of its provisions, however, and still more in the mode of its acceptance by the monarch, as 'a voluntary and free act of our royal authority,' and as a 'concession made to,' not a contract entered into with, his subjects, it was open to the misconstructions which eventually led to the revolution of 1830. The 'charte' sworn to on the 29th August of that year by King Louis Philippe modified this and some of the other provisions of that of 1814. On that occasion, the king explicitly recognised the sovereignty of the people. This document, which, with some modifications, remained in force till the revolution of 1848, is of so much importance, not only from its bearing on the past history, and possibly on the future destiny of France, but from the analogies which it presents to our own constitution, that we shall endeavour to present a condensed view of its leading provisions.

It consisted of 67 articles, divided into 7 heads. Of these, the 1st head, containing 11 articles, treated of the public rights of the French people. It provided for the equality of all Frenchmen—a doctrine which it inherited from the Revolution, and which it unfortunately left to be understood in a sense inconsistent with monarchy, and indeed with any other form of government than pure democracy (see EQUALITY)—for their equal admissibility to all employments, civil and military, and for their freedom from arrest, otherwise than by legal process. It guaranteed the enjoyment of religious liberty, and the payment of the ministers of all Christian denominations—a privilege which in 1831 was extended even to Jews. The liberty of printing and publishing was insured, the censorship of the press and conscription were abolished, an amnesty for all political offences was proclaimed, and the security of property guaranteed, except when its sacrifice should be requisite for the public good, in which case it was declared that the owner must be indemnified. The 2d head set forth the nature and limitations of the kingly power in 8 articles. The supreme executive power, the command of the army and navy, and the right of making war, and treaties of peace, alliance, and commerce, were reserved to the monarch. To him, also, it belonged to nominate to all offices of public administration, to make all necessary regulations for the execution of the laws, but in no case to suspend them or dispense with them. The high duties of legislation were shared between the king, the Chamber of Peers, and the Chamber of Deputies; it being provided that every law should be agreed to by a majority of each chamber, and sanctioned by the king. Any one of the three branches of the legislature might originate any bill, except a money-bill, which was reserved for the Chamber of Deputies, as for the House of Commons in England. The 3d head contained ten articles regarding the Chamber of Peers, the nomination of whom was vested in the king (the princes of the blood being peers by right of birth). No limit was set to their number; but by the law of 9th December 1831, incorporated in the C., it was declared that their dignity should be for life only. The Chancellor of France was president. The Chamber of Peers assembled simultaneously with that of the Deputies, and its sittings were public. The personal privileges of the peerage, as they exist in England, were introduced. The 4th head concerning the Chamber of Deputies contains 16 articles. It provides for the election of the deputies and the sittings of the chamber. The electoral qualification is declared to be the payment of 200

francs of direct taxes, whilst that of a deputy is the payment of 500. The voting is by ballot, both at elections and in the chambers. The number of deputies, which at first was 430, was afterwards raised to 450. Each deputy was elected for five years, and one half of those for each department were required to have their political domicile within it. The C. became a nullity by the revolution of February 1848; and by the new constitution promulgated on the 4th of November of that year, the monarchy of France was converted into a democracy. By chapter 4 of that document, the legislative power was vested in a single assembly of 950 members, including the representatives of Algeria and the other colonies. The property electoral qualification was abolished, and the age reduced for electors to 21, and for delegates to 25. The period of three years was fixed for the continuance of the national assembly. By chapter 5, the executive power was intrusted to a citizen, who was to bear the title of President. He was not to be less than 30 years of age, his tenure of office was to be 4 years, and he was not to be re-eligible until after an interval of 4 years. For an account of the subsequent changes by which these and the other arrangements adopted at the revolution of 1848 have since been superseded, see FRANCE.

**CHARTER** (Lat. *charta*; Gr. *chartes*, paper, or anything written upon, from *chartare*, to scratch or write). In its most general signification, C. is nearly synonymous with *deed* and *instrument*, and is applied to almost any formal writing, in evidence of a grant, contract, or other transaction between man and man. In private law, its most important use is in the alienation of real estates, the writing given to the new proprietor by the old, in proof of the transference title, being usually called a charter. In public law, the name is given to those formal deeds by which sovereigns guarantee the rights and privileges of their subjects, or by which a sovereign state guarantees those of a colony or other dependency. See CHARTER, MAGNA CHARTA. There is another sense of the term, in which it is in a measure intermediate between the two we have mentioned—viz., where we speak of the C. of a bank or other company or association. In this latter sense it signifies an instrument by which powers and privileges are conferred by the state on a select body of persons for a special object. See BANK, CORPORATION, JOINT-STOCK COMPANY, &c. The requisites of a C., when used in the first of these significations, according to the law of England, will be pointed out under DEED.

**ROYAL CHARTERS**, generally written in Latin, are of two kinds: I Grants of lands, houses, honours, or liberties to persons who did not previously possess them; II. Charters confirming grants previously made, and therefore called 'Charters of Confirmation.' Confirmation charters are of three kinds: 1. Charters confirming previous grants, without reciting them; 2. Charters of simple confirmation, without addition of anything new; 3. Charters reciting previous charters and confirming them, with addition of something new. These last two classes of charters are called charters of 'Insipicimus,' or 'Vidimus,' from the word used by the grantees in saying that he has seen the C. which he confirms. Royal charters generally contain seven clauses: 1. The 'Premises,' i.e., the name and style of the grantor, the persons to whom the C. is addressed, the name and style of the grantee, the reason why the grant is made, and the description of the thing granted; 2. The 'Tenendum and Habendum,' i.e., the way in which the thing granted was to be held and had; 3. The 'Reddenda,' the return of rent or service which was to be made to the grantor by the grantee;

forth the seal, signature, or subscription by which the C. was authenticated; 6. The 'Hui Testibus,' or testing-clause, enumerating the persons who were present as witnesses when the C. was granted; 7. The 'Date,' setting forth the time when, and the place where, the C. was granted.

CHARTER, in the law of Scotland, is the written evidence of a grant of heritable property, under the conditions imposed by the feudal law—viz., that the grantee, or person obtaining, shall pay at stated periods a sum of money, or perform certain services to the grantor, or person conferring the property. A C. must be in the form of a written deed. The grantor of a C., in virtue of the power which he thus retains over the property and its proprietor, is called the superior; and the grantee, in consequence of the services which he undertakes to render, the vassal; whilst the stipulated sum to be paid, or service to be rendered, is called the duty.

Charters are either blench or feu, from the nature of the service stipulated—*me* or *de me*, from the kind of holding or relation between the grantor and grantee; and original or by progress, from being first, or renewed, grants of the subjects in question.

*Blench and Feu Charters.*—The duty which the superior required of his vassal in former times was almost always military service, and the vassal was then technically said 'to hold ward'—to hold on condition of warding or defending his superior. But subsequent to the rebellion of 1745, in which the dangerous tendencies of the feudal relation were experienced, this holding was abolished (20 Geo. III, c. 50), and the only duties which it has since been lawful to insert in C. are *blench* and *feu* duties. The former is a merely nominal payment—a penny Scota, a red rose, or the like, *si petatur tantum* (should it be asked); the latter is a consideration of some real value. Original blench C. having lost all object, and having no other effect but that of subjecting superiors to considerable expense in keeping up their titles, have become rare in modern practice. The forms of charters varying according to the circumstances in which they are granted, and the relations established between the grantor and grantee, are of too technical a nature to admit of explanation in this work. They will be found very clearly and shortly stated in Bell's *Law Dictionary*, voce 'Charter.'

CHARTER-HOUSE (a corruption of *Chartreuse*, i.e., Carthusian) is a hospital, chapel, and school-house, in London, instituted in 1611 by Sir Thomas Sutton, of Campe Castle, in the county of Cambridge. It had originally been a Carthusian monastery (founded in 1371 by a Sir Walter Mauny and the Bishop of Sudbury), but on the dissolution of monastic establishments by Henry VIII, it was made a place of deposit for his nets and pavilions. After undergoing many alterations, and passing into the possession of various distinguished persons, it was finally purchased from Lord Suffolk, for £13,000, by Sir Thomas Sutton, who endowed it with the revenues of upwards of 20 manors, lordships, and other estates, in various parts of England. This 'master-piece of Protestant English charity,' as old Fuller calls it, serves three uses—it is an asylum for poor brethren, an educational and a religious institution; hence Bacon terms it a 'triple good.' The poor brethren are 80 in number. None are admitted under 50 years of age, and only those who have been housekeepers are eligible. Each brother has a separate apartment, a share of attendance from domestics, an ample, though plain diet, and an allowance of about £26 a year for clothes and other

bygone years were Elkanah Settle, the antagonist of Dryden; John Bagford, the antiquary; Isaac de Groot, a descendant of Grotius; and Alexander Macbean, who assisted Johnson in the preparation of his Dictionary. The scholars are 44 in number, admissible between the ages of 10 and 14. They are understood to be 'the sons of poor gentlemen to whom the charge of education is too onerous'; but, as in the case of the poor brethren, it is not always the proper parties who are chosen. There are exhibitions, scholarships, and medals competed for at certain times by the scholars. In addition to the scholars properly so called, i.e., such as receive a free board and education, a large number of youths are sent to the C. school because of its reputation. These either board with the masters, or simply attend during the day. The number of extra boarders is nearly double that of the scholars. The institution is under the direction of the Queen, fifteen governors, selected from the great officers of state, and the master himself, whose salary from the foundation is £800 per annum. Among the eminent individuals educated in this establishment, are Dr Barrow, Judge Blackstone, Addison, Steele, John Wesley, Bishop Thirlwall, George Grote, W. M. Thackeray, and Sir Charles Eastlake.

The C., which is situated at the upper end of Aldersgate Street, is a quaint old building, interesting, though not very beautiful. The chapel contains Sutton's tomb, which was opened in 1842, when the body of the founder was discovered in a coffin of lead adapted to the shape of the body, like an Egyptian mummy-case.

CHA'RTER-PARTY (Fr. *chartre-partie*, so called from such documents being at one time divided—in Fr. *parti*—and one half given to each party concerned), the title given to a contract in which the owner, or master of a ship, with consent of the owner, lets the vessel, or a portion of her, to a second party, for the conveyance of goods from one port to another port; hence the vessel is said to be *chartered*. The document must be stamped. It must specify the voyage to be performed, and the terms on which the cargo is to be carried. On the part of the ship, it is covenanted that she shall be sea-worthy; well-found in rigging, furniture, and provisions; and that the crew be suitable in number and competency; that she shall be ready to receive the cargo on a given day, wait its complete delivery for a certain period; and sail for the stipulated port when laden, if the weather for the time permits. The freighter's portion of the contract obliges him to load and unload at suitable periods, under specified penalties, and to pay the freight as agreed on. The master must not take on board any contraband goods, or otherwise render the vessel liable to seizure. The owner is not responsible for losses caused by war, fire, or shipwreck, unless arising from negligence of the master or crew.

CHARTISM, a movement in Great Britain for the extension of political power to the great body of the people, arising in a great measure out of widespread national distress and popular disappointment at the results of the Reform Bill. Prior to 1831, the middle classes had sought popular aid towards obtaining their own enfranchisement. The assistance was given, the people expecting to receive help in their turn. After the passing of the Reform Bill, agitation ceased for a time, and the members returned to parliament were indifferent, or opposed, to any further change in the political arrangements

## CHARTISM.

of the country. The middle classes were satisfied with their own success, and generally looked with small favour on projects for the further extension of political influence among the masses. A season of commercial depression set in about 1835, and failing harvests for several years terribly increased the sufferings of the people. Food became dear, wages fell, manufactories were closed, work became scarce. The people associated their sufferings with their want of direct influence upon the government, and agitation for an extended franchise began. In 1838, a committee of 6 members of parliament and 6 working-men prepared a bill, embodying their views as to what were just demands on the part of the people. This was the 'People's Charter.' It claimed—1. The extension of the right of voting to every (male) native of the United Kingdom, and every naturalised foreigner resident in the kingdom for more than two years, who should be 21 years of age, of sound mind, and unconvicted of crime; 2. Equal electoral districts; 3. Vote by ballot; 4. Annual parliaments; 5. No property qualification for members; and 6. Payment of members of parliament for their services. This programme was received with enthusiasm. Immense meetings were held all over the country, many of them being attended by two or three hundred thousand people. Fiery orators fanned the popular excitement, and under the guidance of the extreme party among their leaders, physical force was soon spoken of as the only means of obtaining justice. The more moderate and thoughtful of the Chartists were overruled by the fanatical and turbulent spirits, and the people, already aroused by suffering, were easily wrought into frenzy by those who assumed the direction of their movements. In the autumn of 1838, torchlight meetings began to be held. The danger of these meetings was obvious, and they were at once proclaimed illegal. Some of the more prominent leaders were arrested, amid intense popular excitement, and subjected to various terms of imprisonment. A body calling itself the National Convention, elected by the Chartists throughout the kingdom, commenced sitting in Birmingham in May 1839. It proposed to the people various means of coercing the legislature into submission, recommending, among other things, a run on the savings-banks for gold, abstinence from excisable articles, exclusive dealing, and in the last resort, universal cessation from labour. During its sittings, a collision took place with the military in Birmingham. Public meetings were forbidden, and alarming excesses were committed by the irritated mob. In June 1839, a petition in favour of the Charter was presented to the House of Commons, signed by 1,280,000 persons. The House refused to name a day for its consideration, and the National Convention retaliated by advising the people to cease from work throughout the country. Fortunately, this advice was not followed, but the disturbance in the public mind increased, and in November, an outbreak at Newport took place, which resulted in the death of 10 persons and the wounding of great numbers. For taking part in this wild insurrection, three of its leaders were sentenced to death, but their punishment was afterwards commuted to transportation. In 1842, great riots took place in the northern and midland districts, not directly caused by the Chartists, but encouraged and aided by them after the disturbances began. In the same year, an attempt was made by Joseph Sturge to unite all friends of popular enfranchisement in a Complete Suffrage Union, but he only succeeded in dividing their ranks. In 1848, the turmoil in France created great excitement in England, and much anxiety was felt lest an armed attempt should be

made to subvert the institutions of the country. Two hundred thousand special constables were enrolled in London alone. There were several local outbreaks, and much real danger, but the attempts at disorder were efficiently met, and, as usual, the only result was the punishment of the more prominent men, and the postponement of the desired reforms.

Since 1848, C. has gradually died out. Its principles were not new. The Duke of Richmond, in 1780, introduced a bill into the House of Lords to give universal suffrage and annual parliaments. In the same year, Charles James Fox declared himself in favour of the identical six points which were afterwards included in the Charter. And nearer our own time, Earl Grey, Mr Erskine, Sir James Mackintosh, and many others, formed a 'Society of Friends of the People,' which aimed at obtaining a very large extension of the suffrage.

The great body of Chartists were, however, not so much actuated by the weight of precedent or argument, as impelled by the pressure of actual want, and an indefinite feeling that the laws were somehow to blame for not providing them with the means of comfortable subsistence. But there were many among them who had studied the principles involved in their demands, and maintained them from an intelligent conviction of their truth. These men declared that all persons had an equal natural right to share in determining the laws under which they lived; and further, that as they were required to contribute to the taxation of the country, they were justly entitled to be heard as to the application of the public funds. Taxation and obedience being universal, representation ought to be so. This view being conceded, all the other points of the Charter naturally followed, they being merely arrangements for securing the free action of the right contended for. Some of the Chartist advocates went far beyond this. There were those among them whose aims included little less than the reorganisation of society. One of the ablest advocates of the cause wrote in favour of nationalising the land, and remodelling the currency; he also proposed a system of state loans for the assistance of labourers who desired to become capitalists, and national marts for the exchange of wealth on terms of equity and justice. Pressed a little further, these views would have developed into Communism; but so far as we are aware, most Chartists held so strongly the doctrine of *individual rights*, that they were not likely to subordinate *man to society*. See COMMUNISM, SOCIALISM. The object aimed at by the majority, was merely the extension of the franchise to the masses, in the belief that they would use it wisely and honestly, and put an end to what they considered the selfish and interested rule of classes who had long monopolised the control of the state. The opponents of C. answered, that if the question was argued as one of right, it would go far beyond the conclusions which the Chartists had reached. The *right* appertained to women as well as to men, and there was no just reason why sane persons under 21 should be deprived of it. It would also, they maintained, give all power to the most ignorant classes of the community, and thus subject intelligence to brute force. Government existed for the benefit of society, and ought, as far as possible, to depend on the wisdom, and not on the mere number of the people. Then if representation depended upon taxation, it should vary in proportion to the taxes paid. Finally, they denied that men *as such* had a right to vote; their right was to be well governed, and universal suffrage was more likely to destroy society than to confer happiness or insure justice.

The cause which put an end to C. as an organisation

was undoubtedly the improvement in the circumstances of the people which followed the repeal of the Corn Laws. Since then, the chief points of the Charter have actually become law. A property qualification is no longer necessary in a representative; the reform acts of 1867—1868 have virtually established manhood suffrage; and the act of 1872 gave vote by ballot. The efforts of the majority of those who live by manual labour are now directed towards securing, by trades-unions and other means, a larger share than formerly in the profits of industry.

**CHARTRES**, a city of France, in the department of Eure-et-Loir, 47 miles south-west of Paris, is built partly at the base and partly on the declivity of a hill overlooking the river Eure, which is here divided into two channels, one flowing within, and the other without the ramparts, which are converted into agreeable promenades. C. consists of an upper and lower town, connected by streets almost inaccessible to carriages. The upper town has some good streets, but the lower is ill built. The houses are old, and many of them composed of wood, with their gables to the street. The cathedral, one of the largest and most imposing ecclesiastical structures in Europe, with its lofty spires, one of them towering to a height of more than 400 feet, crowns the top of the hill. It has no less than 130 painted-glass windows, the workmanship of which is unsurpassed, if indeed equalled elsewhere in France. The church of St Pierre, and the obelisk to the memory of General Marceau, are also objects of interest. The weekly corn-market of C. is one of the largest in France, and is remarkable as being under a corporation of women, who contrive to get through all the business most satisfactorily in less than an hour. It has manufactures of woollen, hosiery, and leather. Pop. (1872) 16,977.

C. is a very ancient city. Under the Roman rule it was called *Astricum*, and remains of Roman antiquity are still found.

**CHARTREUSE, LA GRANDE**, a celebrated monastery in France, in the department of Isère, situated 13 miles north-north-east of Grenoble, in the wild and romantic valley of the Guiers, nearly 4000 feet above the sea. It is surrounded by the mountain-forests of the Alps; and the route to it, through a mountain-gorge, down which a rapid river dashes far below the traveller, while above him rise precipitous and foliage-lined rocks, some hundreds of feet in height, is one of the most picturesque. The convent is a huge ungainly structure, dating mostly from the 17th c., earlier buildings having been destroyed several times by fire. The convent owes its origin to St Bruno, who settled a little higher up the mountain in 1084, giving the name of the place, C., to his order. The monks had at one time considerable property, but they were despoiled at the revolution of 1789.

**CHARTULARY** (Lat. *chartularia*, *chartologia*) is, as its name implies, a collection of charters. So soon as any body, ecclesiastical or secular, came to be possessed of a considerable number of charters, obvious considerations of convenience and safety would suggest the advantage of having them classified and copied into a book or roll. Such book or roll has generally received the name of a Chartulary. Mabillon traces chartularies in France as far back as the 10th c., and some antiquaries think that chartularies were compiled even still earlier. But it was not until the 12th and 13th centuries that chartularies became common. They were kept not only by all kinds of religious and civil corporations, but even by private families. Many of them have been printed, and their contents generally are of the

greatest value in all historical, archaeological, and genealogical inquiries.

**CHARYBDIS.** See SCYLLA AND CHARYBDIS.

**CHA'SCHISH.** See HEMP, INDIA.

**CHASE.** When one vessel is pursuing another at sea, the pursued vessel is often called the *chase*, and the pursuer the *chaser*. The manœuvre also gives name to certain guns on board ship: a *bosom-chaser* being a gun pointing ahead, and a *stern-chaser* pointing astern.

**CHASE**, in a gun, is the name given to the greater portion of the length between the muzzle and the trunnions.

**CHASIDIM** ("Pietists"), this name anciently denoted a whole class of Jewish sects. After the Babylonian captivity, the Jews, with regard to their observance of the law of Moses, were divided into two classes—*Chasidim* and *Zadikim*. When the so-called Great Synagogue was commissioned by the Persian government to draw up a code of civil and religious laws for the emigrant Jews returning to settle in their native land, several innovations were made on the Mosaic law. Those who accepted these innovations were styled the C.; while those who rejected them were styled, or styled themselves, the *Zadikim*, or 'upright,' because they adhered strictly to the law given by Moses, without observing any of the additions made to it. The C. branched forth into several sects, all holding traditions in connection with the written law, which they believed to possess a divine sanction equally with that law. The Pharisees, so often mentioned in the New Testament, formed an early sect among the C., while from the *Zadikim* sprang forth the Hellenistic Samaritans, Essenes, Sadducees, &c. Afterwards, the C., or Pharisees, split into Talmudists, Rabbinita, and Cabballists, some of whom underwent still further subdivision.—The modern C. are not, like those in the times of the Maccabees, marked by any peculiar spiritualistic tendency in religion, but rather by a strict observance of certain traditional forms, and a blind subservience to their teachers. Their doctrine was promulgated in the middle of the 18th c. by Israel of Podolia, called *Baal-Shem* ('Lord of the Name,' so called because he professed to perform miracles by using the great cabalistic name of the Supreme Being). Though condemned by the orthodox rabbis, this new teacher had great success in Galicia, and when he died (1760) left 40,000 converts. They are now broken into several petty sects; their religion is utterly formal, and its ceremonies are coarse and noisy.

**CHASING**, the art of working raised or half-raised figures in gold, silver, bronze, or other metal. It was called *ciselatura* by the Romans; and the term is expressly limited by Quintilian to working in metal. The same art when exercised on wood, ivory, marble, precious stones, or glass, was called *sculptura*. See CARVING. Iron was sometimes, though rarely used, silver having been always the favourite metal for this purpose. Closely connected with, but still distinguished from C., is the art of stamping with the punch, which the Romans designated by *excudere*. The Greek *toreutice* is usually supposed to correspond to C., but the point is by no means free from dispute. The art was known at a very early period, as may be inferred from the shield of Achilles, the ark of Cypelus, and other productions of the kind. Such portions of the colossal statues made by Phidias and Polycletus, as were not of ivory, were produced by the *toreutic* art. The statue of Minerva was richly adorned in this manner. Besides Phidias and Polycletus, Myron, Myrs, and Mentor were celebrated *toreutic* artists in antiquity.

and amongst many moderns the most famous is Benvenuto Cellini (q. v.).

**CHASSE**, music composed in imitation of the chase, and performed chiefly by horns, occasionally combined with other wind-instruments. Its movement is in  $\frac{4}{4}$  time. The best specimens of this kind of music are an overture by Mehul, and a C. for the pianoforte by Kreutzer.

**CHASSE**, DAVID HENDRIK, BARON, was born in Thiel, March 18, 1765, began his military career when but ten years of age, became a Lieutenant in 1781, and captain in 1787. After the revolution of that year, C., as siding with the humbled Dutch patriots, took French service; was appointed lieutenant-colonel in 1793; and, two years later, found himself marching towards the Netherlands under the command of Pichegru. He afterwards fought with the French in Germany and Spain, gaining great distinction and the appellation of *Général Bayonnette*. As lieutenant-general of the Dutch forces in 1815, C. added to his laurels on the field of Waterloo. After the peace he was made governor of Antwerp in 1830, and bravely defended it against the united Belgians and French from November 29 till December 23, 1832, when he was forced to surrender. He died in May 1849.

**CHASSEURS** (Fr. hunters) is a name, either in this form or in some other equivalent to it, given to some of the light troops in several of the European armies. A Tyrolean corps in the Austrian army took the name of Jägers, from being chiefly formed of chamois hunters (Jäger), and consequently good marksmen; and, in imitation of these Jägers, other European corps have been established, always understood to be good shots. Battalions of C. were enrolled in the French army in 1815; but the organisation soon afterwards underwent a change. Concerning a more recent French corps, see the next article. There are C.-à-Cheval as well as C.-à-Pied in the French army; and equivalent corps in other armies. Some of the most trustworthy troops under Garibaldi, in the Italian wars of 1859 and 1860, were the *Cacciatori dei Alpi*, or Hunters of the Alps, a counterpart to the Tyrolean Jägers in origin and name.

**CHASSEURS DE VINCENNES** is one of the names given to a famous corps in the French army. About the year 1835, when certain improvements had been made in the French rifle, the Duke of Orleans ordered the formation of a company of riflemen, armed with the new rifle; they were garrisoned at Vincennes. They proved so efficient that in 1838 a whole battalion was organised, which was called indifferently the *Tireurs* (sharshooters) or *Chasseurs de Vincennes*.

**CHASTE TREE**. See VITEK.

**CHASUBLE** (Lat. *casula*, *casubula*, and *casibula*), the uppermost garment worn by priests in the Roman Catholic Church, when robed for

the celebration of the mass. It was called also 'the Vestment,' and under that name seems occasionally to have been used in the English Church after the

Reformation. Originally it covered the priest from head to foot, like a little house, whence some writers think it had its name of *casula*. In more recent times, at least, it was made of velvet. It was of an elliptical shape, like a *casice pieca*, with a hole in the middle for the head; it had no sleeves. When put on, it shewed two peaks, one hanging down before; another, on which a cross was embroidered, hanging down behind. According to Hildebert, the C. signified good works; according to Alcuin, charity; according to another writer, the unity of the faith. Durand makes one peak the symbol of love to God, the other peak the symbol of love to our neighbour. In France, the press or wardrobe in which chasubles were kept was called the *chasublier*.

**CHAT** (*Saxicola*), a genus of small birds of the very numerous family *Sylviidae* (q. v.), distinguished by a bill slightly depressed, and widened at the base. They have rather longer legs than most of the family. They are lively birds, flitting about with incessant and rapid motion in pursuit of the insects on which they chiefly feed. They are found in Europe, Asia, Africa, and New Holland. Three species are British—the stonechat, whinchat, and wheatear.—The Yellow-breasted C. of the United States (*Icteria polyglotta*) is a larger bird, and belongs to the family *Turdidae* or *Muridae*.

Chasuble.

Chasseur de Vincennes.

**CHAT MOSS**, a bog in Lancashire, the largest in England, about 7000 acres in extent, and celebrated as having been the scene of the first great and successful efforts for the reclaiming of bogs, by Mr Roscoe of Liverpool, in the end of the 18th and beginning of the 19th c., and of one of the great engineering triumphs of George Stephenson in the construction of the Liverpool and Manchester Railway. It is situated between Liverpool and Manchester, at no great elevation above the sea. It is from 20 to 30 feet in depth, and of such consistency that when an attempt was first made to survey it for the Liverpool and Manchester Railway, the attempt was relinquished because of the impossibility of obtaining a sufficiently solid stand for the theodolite. Drains are filled up almost as fast as they are cut, by a pulpy stuff flowing into them, and affect only a few feet on either side. Great danger is experienced by any person stepping unwarily on the surface of the bog; and when he begins to sink, his struggles to extricate himself only cause him to sink faster and deeper. Mr Roscoe's agricultural improvements were effected by numerous parallel drains in the parts on which he operated. The use of *pattens* by his workmen, and the adaptation of them to the feet of the horses employed, have been mentioned in the article BOG. The enlargement of the circle upon which a horse's foot rests from 5 inches diameter to 7, nearly doubles it, and consequently diminishes nearly by one-half the pressure on each unit of surface. Mr Stephenson, when he could find no one to countenance him in his views, calculated with confidence on the application of this principle to the railway, so that even the ponderous locomotive and train might be supported by a sufficient extension of the bearing surface; and this he accomplished by spreading

branches of trees and hedge-cuttings, and in the softest places rude hurdles interwoven with heather, on the natural surface of the ground, containing intertwined roots of heather and long grass; a thin layer of gravel being spread above all, on which the sleepers, chairs, and rails were laid in the usual manner. Drains were at the same time cut on both sides of the line, and in the central part of the moss a conduit was formed beneath the line of railway, of old tar-barrels placed end to end. Notwithstanding difficulties which every one but himself deemed insuperable, Mr Stephenson constructed the portion of the line through C. M. at a smaller expense than any other part of the railway. There still is 'a sort of springiness in the road over the moss, such as is felt when passing along a suspension-bridge;' and 'those who looked along the moss as a train passed over it, said they could observe a waviness, such as precedes and follows a skater upon ice.'

The complete reclaiming of C. M. for agricultural purposes can be only a question of time and expense. It seems capable of becoming one of the most productive tracts of land in England.

**CHÂTEAU, CHÂTEL,** or CASTEL, from the Lat. *castellum*, a fort, enters as a component part into many names of places in France.

**CHATEAUBRIAND, FRANÇOIS AUGUSTE, VICOMTE DE**, one of the most distinguished of French authors, was born September 4, 1769, at St Malo, in Bretagne, and received his early education in the college at Rennes. While travelling in North America in 1790, he accidentally read in an English newspaper the account of the flight and arrest of Louis XVI. He immediately returned to France, intending to fight against the republic; but being seriously wounded at the siege of Thionville, in September 1792, he escaped to England, where he lived in such poverty that he was compelled to make translations for the booksellers, and to give lessons in French. In 1797, he published his first political essay, *Sur les Révolutions Anciennes et Modernes, considérées dans leurs Rapports avec la Révolution Française* (2 vols., London), a republican and sceptical work, the outcome of hardship, poverty, and sorrow. His scepticism soon vanished, but republican impulses continued to flash out at intervals during the whole of his strangely checkered, inexplicable, and inconsistent career. In 1800, C. returned to Paris, and wrote for the *Mercure de France*. In this journal, he first printed his tale of *Atala* (1801), with a preface lauding the First Consul, Bonaparte. Its success was remarkable, but nothing to the miraculous enthusiasm excited by his *Génie du Christianisme* (1802), a work exactly suited to the jaded scepticism of the age, and also in accordance with the policy of the First Consul, who was then concluding the concordat with the pope, and wished to make the Roman Catholic priesthood subservient to his measures. Bonaparte, therefore, appointed C. secretary to the embassy in Rome, and, in 1803, sent him as ambassador to the little republic of Valais. On the execution of the Duke d'Enghien, March 21, 1804, C. resigned in disgust. In 1806, he commenced his pilgrimage to the Holy Land, visited Greece, Palestine, Alexandria, and Carthage, and returned through Spain to France in May 1807. From this period to the fall of Napoleon, he lived privately, publishing only two works of any value—*Les Martyrs*, and the *Itinéraire de Paris à Jérusalem*. In 1814, his eloquent brochure, *De Bonaparte et des Bourbons*, excited such attention, that Louis XVIII. declared it was worth an army of 100,000 men in favour of legitimacy.

780

After the battle of Waterloo, C. returned to Paris, where he was made peer and minister of state. Gradually his monarchical zeal subsided, and, in his address, *De la Monarchie selon la Charité*, delivered in the Chamber of Peers, he gave expression to such liberal tendencies as offended the king, who erased his name from the list of his counsellors. Soon, however, he appeared again as an ultra-royalist; and at the baptism of the infant Duke de Bordeaux, C. presented to the Duchess of Berry a flask filled with water from the Jordan. In 1822, he was appointed ambassador-extraordinary to the British court, but was rather rudely dismissed from office in 1824.

In 1826, C. prepared the first edition of his collected works, for the copyright of which the publisher gave the large sum of 600,000 francs, of which C. returned 100,000. During the days of July 1830, he was staying with his friend Madame Récamier at Dieppe; but as soon as he heard tidings of the revolution, he hastened to Paris. He refused to take the oath of fealty to Louis Philippe. This political crotchettness, which always rendered it impossible to know beforehand what course of conduct C. would adopt, is perhaps best explained by the following passage from his *De la Restauration et de la Monarchie Elective* (Paris, 1831): 'I am a Bourbonist in honour, a Monarchist on grounds of rational conviction; but in natural character and disposition, I am still a Republican.' In 1832 he revised a new edition of his works, and, after visiting the court of the expelled Bourbons, devoted his attention to the preparation of his memoirs, intended to be published posthumously (*Mémoires d'outre Tombe*), though considerable extracts were printed during his lifetime. He also found leisure to write several other works. He died July 4, 1848.

C. wrote with warmth, energy, and a rich supply of imagery. Many of his descriptive passages are excellent, but his ideas want depth and coherency.—Marin, *Histoire de la Vie et des Ouvrages de M. de Chateaubriand* (2 vols., Paris, 1832).

**CHÂTEAUDUN**, a town of France, in the department of Eure-et-Loir, is situated on the Loir, a tributary of the Loire, about 26 miles south-south-west of Chartres. The streets are straight and well built, and an old castle, with an enormous tower, overlooks the town. C. has manufactures of blankets and leather. Pop. (1872) 5564.

**CHÂTEAU-GONTIER**, a town of France, in the department of Mayenne, situated on the river of that name, here crossed by a stone bridge, 18 miles south-south-east of Laval. C. has some good houses, but the streets are not well laid out. It has lime and woollen manufacture. Pop. (1872) 6371.

**CHÂTEAUNEUF DE RANDON**, a village of France, in the department of Lozère, 12 miles north-east of Mende. A pretty historical incident connected with the place, which was formerly fortified, makes it interesting. In 1380, the fortress, then held by the English, was besieged by the troops of Charles V., under the command of the gallant Du Guesclin. The English governor, sore pressed, promised to yield in fifteen days if no succour arrived. In the meantime, Du Guesclin died, and his successor was appointed, who, at the expiry of the fifteen days, summoned the governor to surrender. He refused to yield up the keys to any but Du Guesclin; and when informed of his death, marched out, and on bended knee laid the keys and his sword on the dead hero's bier.

**CHÂTEAUROUX**, a town of France in the department of Indre, situated on a rising ground in

## CHÂTELET-LOMONT—CHATHAM ISLANDS.

the midst of an extensive plain, on the left bank of the river Indre, 166 miles south of Paris by railway. The town, which was formerly dirty and ill built, has been greatly improved within the last quarter of a century. C. does not possess much interest for the traveller. It is a busy place, with extensive woollen factories, besides manufacture of cotton, hosiery, yarn, hats, paper, parchment, hardware, leather, &c. Some of the best iron in France is found in the vicinity. The town owes its origin to a castle built here in the 10th century. Pop. (1872) 14,893.

**CHÂTELET-LOMONT, GABRIELLE EMILIE, MARQUISE DU**, a very learned French woman, notorious for her intimacy with Voltaire, was born at Paris, 17th December 1706. At an early period she displayed a great aptitude for the acquisition of knowledge. She studied Latin and Italian with her father the Baron de Breteuil, and subsequently betook herself with zeal to mathematics and the physical sciences. Distinguished alike for her beauty and talent, she soon found a host of suitors for her hand. Her choice fell on the Marquis du Châtelet-Lomont, but her marriage did not hinder her from forming a *tendresse* for Voltaire, who came to reside with her at Cirey, a château on the borders of Champagne and Lorraine, belonging to her husband. Here they studied, loved, quarrelled, and loved again, for several years. In 1747, however, poor Madame C. became 'not insensible to the brilliant qualities' of a certain M. Saint-Lambert, a captain of the Lorraine Guards; and the result was, that the philosopher had to make room for the soldier, and content himself for the future with being the 'devoted and indulgent friend' of his former mistress. This new intimacy became fatal to Madame Châtelet. She died at Luneville, 10th September 1749, a few days after having given birth to a child. Her first writing was a treatise on the philosophy of Leibnitz. She also translated the *Principia* of Newton into French, accompanying it with algebraic elucidations. It did not, however, appear till 1756, some years after her death. Her correspondence with Voltaire is interesting; but the fact that a woman so highly gifted as Madame C., and possessing so many amiable qualities, should never have dreamed that there was anything wrong in her *liaisons*, proves with terrible conclusiveness how corrupt was that philosophic society which, in the 18th c., professed to explode superstition and enlighten France and the world.

**CHÂTELLERAULT**, a town of France, in the department of Vienne, situated on the river of that name, 18 miles north-north-east of Poitiers. A handsome stone bridge, with a massive castellated gateway, built by Sully, at one end, connects it with a suburb on the other side of the river. C., which is an ill-built, mean-looking town, is one of the chief seats of the manufacture of cutlery in France, and since 1820 has had a national manufactory of swords and bayonets. Its river-port makes it the entrepôt for the produce of an extensive district. The Duke of Hamilton derives his title of Duke of Châtellerault from this place. Pop. (1872) 13,019.

**CHA'THAM** (Saxon, *Ceteham* or *Cættham*, understood to signify the 'village of cottages'), a parliamentary borough, river-port, fortified town, and naval arsenal, in the county of Kent, situated on the right bank of the Medway, at the upper part of its estuary, 30 miles east-south-east of London. Much of C. is ill built and irregular. The High Street is  $1\frac{1}{2}$  mile long, parallel to the river, and swarms with soldiers and Jews. The refuse timber of the dock-yard is much used in building the

house-walls. C. owes its importance to its naval and military establishments situated at Brompton village (on a height half a mile north of C.), and on the Medway estuary. The C. fortified lines are the frequent scenes of field-operations, imitation battles, and grand reviews. Pop. 44,135. The borough, which sends one member to parliament, is governed by a head-constable under the magistrates of Rochester. The Romans seem to have once had a cemetery here. Traces of Roman villas have been found, with Roman bricks, tiles, coins, and weapons. The dock-yard was founded by Elizabeth before the threatened invasion of the Spanish Armada. In 1662, it was removed to its present site. In 1667, the Dutch, under De Ruyter, sailed up the estuary of the Medway, and, in spite of the fire from the castle, destroyed much shipping and stores.

In a military point of view, the lines of detached forts connected with C. constitute a fortification of great strength; and the whole is regarded as a flank defence for London in the event of an invader seeking to march on the capital from the south coast. The place is also defended by some strong forts on the Medway. In and near C. are Fort Pitt, a military hospital and strong fort; barracks for infantry, marines, artillery, and engineers; a park of artillery; and magazines, store-houses, and depots on a large scale.

In a naval sense, C. is one of the principal royal ship-building establishments in the kingdom, and a visit to it never fails to impress the stranger with a sense of the naval power of England. The dock-yard is nearly two miles in length, containing several building-slips, and wet docks sufficiently capacious for the largest ships; and the whole is traversed in every direction by a tramway for locomotives, with a gauge of 18 inches. One peculiar establishment in this dock-yard is a metal mill, which supplies all the royal dock-yards with copper sheets, copper bolts, and other articles in copper and mixed metal. The saw-mills at C. are so extensive, that it is said that, if fully employed, they could cut up timber enough for all the dock-yards. A duplicate of Brunel's block-making machinery is kept at C., ready to supplement the operations of that at Portsmouth. The dock-yard is under the control of a captain-superintendent, and other officers, whose annual salaries vary from £700 to £200 each. Under them are clerks receiving from £450 to £80 each. The actual workmen, artizans and labourers, vary in number according to the amount of ship-building and repairing going on. In the estimates for 1873-1874, provision was made for 2974 ship-wrights, calkers, joiners, sawyers, millwrights, smiths, block-makers, sail-makers, rope-makers, riggers, labourers, &c. at an average wage of about 24s. per man, per week.

**CHATHAM ISLANDS**, a small group in the Pacific, lying about 400 miles due east of the Canterbury settlement, on the Middle Island of New Zealand, in lat.  $43^{\circ} 38'$ - $44^{\circ} 40'$  S., long.  $177^{\circ}-179^{\circ}$  W., being thus almost precisely the antipodes of Toulouse, in France. They were discovered in 1791 by Lieutenant Broughton, both the cluster and its chief member taking the name of his ship. Chatham Island is computed to contain 600,000 acres; a salt or brackish lake, however, of 20 miles in length, occupying the interior. The soil and climate of the archipelago, in general, are said to be good. Wheat yields abundantly; and the horses, cattle, and pigs which have been introduced thrive well. Timber of any size is unknown, so that the native canoe, instead of being cut out of a single tree, is merely wicker-work bound together by cordage of indigenous flax. The

**CHATHAM**, WILLIAM PITT, EARL OF, sometimes styled PITT THE ELDER, one of the greatest English orators and statesmen of the 18th c., was the son of a country gentleman, Robert Pitt of Boconnoc, in Cornwall; and was born November 15, 1708. After an education at Eton and Oxford, he travelled on the continent, and on his return obtained a cornetcy in the Blues. In 1735, he entered parliament for Old Sarum—that synonym for electoral corruption—a borough then belonging to his family. He espoused the side of Frederick Prince of Wales, then at deadly feud with the king, and offered a determined opposition to Walpole, who was at the head of affairs. He was deprived of his commission in consequence—an insult and injury which only increased the vehemence of his denunciations of the court and the government. His influence, both in and out of the House of Commons, increased rapidly; and Walpole being driven from power, the king, notwithstanding his hatred of Pitt, found it necessary to allow of his admission to a subordinate place in the Broad Bottom administration; subsequently he was appointed to the lucrative office of paymaster-general. The Duchess of Marlborough, pleased with his patriotism and powers of oratory, left him £10,000; and later, Sir William Pynsent, struck with similar admiration, left him his whole property. In 1755, when Henry Fox (afterwards Lord Holland) was made secretary of state, finding himself opposed to the foreign policy of the new minister, Pitt resigned office as paymaster. In the following year, when the king, unwillingly acceding to popular demands, had to dismiss Fox, Pitt became nominally secretary of state, but was virtually premier. He immediately began to put into execution his own plan of carrying on the war with France. He raised the militia, and strengthened the naval power; but the king's old enmity, and German predilections, led him to oppose Pitt's policy, who thereupon resigned office in April 1757, but was recalled in June, in obedience to the loud demands of the people.

Now firmly established in power, Pitt's war policy was characterised by unusual vigour and sagacity. Success returned to the British arms. French armies were beaten everywhere by Britain and her allies—in India, in Africa, in Canada, on the Rhine—and British fleets drove the few French ships they did not capture or destroy from almost every sea. But the prime mover of all these brilliant victories found himself compelled to resign (1761), when, on the accession of George III, and owing to the influence of Lord Bute, it was attempted to introduce a vacillating policy into the government; his immediate cause of resignation being the refusal of the majority of the cabinet to declare war with Spain, which Pitt foreseeing as imminent, wished to commence before the Spaniards were thoroughly prepared. As some recompense for his important services, Pitt received a pension of £3000 a year; and his wife, sister of George Grenville, was created Baroness Chatham. Until 1766, Pitt remained out of office, not offering a factious opposition to government, but employing all his eloquence to defeat some of its most omnious measures. In that year he received the royal commands to form a ministry. He undertook the task, choosing for himself—to the astonishment of the public, and the sacrifice, to a considerable extent, of his popularity—the almost sinecure office of Privy Seal, with a seat in the House of Lords as Viscount Pitt and Earl of Chatham. Ill health prevented C. from taking any active part in this ministry, of which he was nominally the head, and

not, however, cease to take an interest in public affairs. He spoke strongly against the arbitrary and harsh policy of government towards the American colonies, and warmly urged an amicable settlement of the differences. But when, America having entered into treaty with France, it was proposed by the Duke of Richmond to remove the minister, and make peace on any terms, C., though much debilitated, came down to the House of Lords, and in a powerful address protested against the implied prostration of Britain before the thrones of the Bourbons, and declared war, with whatever issue, preferable to the proposed terms of peace. This address secured a majority against the motion, and the war was continued. But it was the orator's last effort; for, exhausted by speaking, on rising again to reply to a query addressed to him by the Duke of Richmond, his physical powers suddenly failed, he fell back into the arms of his friends, and was carried from the House. He died May 11, 1778. He was honoured with a public funeral in Westminster Abbey, where a statue was also erected to his memory at the public expense; and in addition, government voted £20,000, to pay his debts, and conferred a pension of £4000 a year on his descendants. C.'s personal appearance was dignified and imposing, and added greatly to the attractions of his oratory, which was of the most powerful kind. His upright and irreproachable character demanded the admiration of his enemies; but his affectedness and haughtiness not unfrequently disgusted his friends, and pride rather than principle seems to have actuated his course at some important conjunctures of his life. He had, however, an intense love of country; the grand object of his ambition being to make his native land safe against all contingencies, and powerful among nations.

**CHÂTILLON**, a town of France in the department of Côte d'Or, on the Seine, about 45 miles north-north-west of Dijon. Pop. 4566. C. is chiefly famous on account of the congress of allied sovereigns held here in 1814, from February 5 to March 19, for the purpose of negotiation with Napoleon respecting conditions of peace. Several of the conditions proposed by the allies Napoleon could not bring himself to submit to, and the negotiations broke up, March 19. On the 25th, when their armies were, in fact, marching on Paris, the allies from Vitry issued their declaration justifying a continuation of the war.

**CHATSWORTH**, the magnificent mansion of the Duke of Devonshire, and one of the most splendid private seats in England, is situated in Derbyshire, on the Derwent, 12 miles north-by-west of Matlock. William the Conqueror gave the domain to his natural son William Peveril. It was purchased by Sir W. Cavendish in Queen Elizabeth's time. Sir W., in 1570, began the old mansion, which was finished by his widow, afterwards Countess of Shrewsbury. In this building Mary Queen of Scots was imprisoned for 13 years. The present edifice, called a palace from its grandeur, includes the old Ionic pile, 183 by 172 feet, built 1687—1706, by the first Duke of Devonshire, after designs by Talman and Wren. The great stables were built about 1706, and the north wing since 1720. The facade is 720 feet long, or with the terraces, 1200 feet. The building is nearly a square, with an interior court. C. is famed for its pictures, sculptures, hangings, carvings, and bas-reliefs. There are some exquisite sculptures by Canova, Thorwaldsen, Chantrey, &c. The grounds around are 9 miles in circuit, including

## CHATTAHOOCHEE—CHATTERTON.

hill and dale, and fine prospects. They were laid out by Loudon and Paxton, and are celebrated for their trees, shrubs, rock-work, deer, and water-works—only surpassed by those at Versailles. The conservatory, unrivalled in Europe, covers nearly an acre, measures 300 by 145 feet, and 65 feet high, has 70,000 square feet of glass, and a carriage-road through it. Hobbes, the philosopher, lived long at Chatsworth.

**CHATTAHOO'CHEE**, a river of the United States, rises on the eastern declivity of the Blue Ridge of the Alleghanies, in the north of Georgia; traverses that state in a south-west direction; becomes the boundary between it and Alabama; and finally, after receiving the Flint from the left, crosses Florida, under the name of Appalachicola, into the Gulf of Mexico. With an entire course of 550 miles, it is navigable upwards as far as Columbus, at a distance of 350 miles from the sea. It forms the principal outlet for the cotton crops of its basin.

**CHATTEL** (Fr. *châtell*, Old Fr. *chapell*, from Lat. *capitale*, corrupted into *captele* and *catallum*, meaning the capital or principal sum in a loan; hence goods in general, especially cattle, as distinguished from land), in the law of England, is a term used to designate any kind of property which, with reference either to the nature of the subject or the character of the interest possessed in it, is not *freehold*. Regarded from a positive point of view, C. included not only all movable property, but all property which, though immovable, was not held on a feudal tenure. Any estate, then, or interest in lands and tenements not amounting to freehold, is a chattel. But as between property thus ‘savouring of reality’ and mere personal movables—money, plate, cattle, and the like—there was a manifest distinction, chattels were, consequently, distinguished into *chattels-real* and *chattels-personal*. Both descriptions of C. in the eye of the ancient law of England, were regarded as inferior to freehold, and formed a subordinate class of property. As distinguished from estates of inheritance, or for life in things immovable, such estate is called *personal*, the others being *real* estate. Till the passing of 8 and 9 Vict. c. 106, livery of seisin was required to pass an estate of inheritance, or for life in corporal hereditaments of *fee* tenure, but such was no more required for the transfer of a C. real than of a C. personal. A C. *real* is also transmitted on the owner's death to his executor or administrator, like a C. personal, and does not descend to his heir like a freehold of inheritance. There is an exception to this rule, however, in the case of chattels which, owing to their intimate connection with property of a freehold nature, cannot be separated from it without injury. Such, for instance, are the muniments of title to an estate, growing grass, deer in a park, and actual fixtures, all of which go to the heir, and not the executor. The tenant of a C. *real*, like the tenant of a C. *personal*, is, moreover, said not to be *seized*, like the tenant of a freehold, but to be *possessed*. Lastly, there can be no estate tail in a C. *real* more than in a C. *personal*, except in the case in which either of them can be regarded as an heir-loom. Formerly, C. might be disposed of by will at an earlier age than real estates, but this was altered by 1 Vict. c. 26.

**CHA'TTERER**, a significant popular name, often applied to the birds of the family *Anopelidae*, a family of the order *Insectivores* and tribe *Dentirostrinae*, having a depressed bill like that of the Fly-catchers (*Muscicapidae*), but somewhat shorter and broader in proportion, and slightly arched. To this family

belong the ootings, wax-wings, piashans, caterpillar-hunters, &c. They are found chiefly in the warmer parts of the old world, although America also produces some. They inhabit low grounds or forests, feeding chiefly on insects and their larvae. Some of them possess powers of song almost equal to those of the nightingale. Many of them are birds of gorgeous plumage.—Only one species is British, sometimes called simply the C., sometimes the Bohemian C. or Wax-wing (q. v.).

**CHATTERTON**, THOMAS, an English poet, whose youth, genius, and tragical death have made him one of the wonders of English literature, was born at Bristol, November 20, 1752. His father, who had once been a chanter in the Bristol cathedral, and also master of a kind of free-school, died two or three months before the poet's birth. C. was educated at a parish-school, was considered a dull child, but making acquaintance with a black-letter Bible which his mother often used, the dormant spirit flashed up. From early years he was fond of all kinds of antiquities; he clung around old walls like the ivy, and haunted twilight ruins like the bat. At the age of 14, he was apprenticed to Mr. Lambert, an attorney. His situation here was uncomfortable, he took his meals in the kitchen with the footboy, and when refractory, was chastised with a ruler. In October 1768, the new bridge at Bristol was opened, and C. sent to a newspaper an account, in antique phraseology and spelling, of the ceremonies attending the opening of the old one several centuries before—the whole purporting to be taken from an ancient MS. To a certain Bristol pewterer, Burgum by name, he presented himself, and astonished the craftsman by the sight of a parchment, in which his pedigree was traced back to the Norman Conquest, adorned by many a splendid marriage, and many a knightly name. He also exhibited to his friends copies of old poems, which he said were composed by one Thomas Rowsey, a monk of the 15th century. These matters made some stir in his native city, but not enough to satisfy C., who resolved to fly at higher game. Accordingly, Horace Walpole, at that time collecting additional materials for his *Anecdotes of Painting in England*, received from C. several pages of antique writing, accompanied by a short note. The pretended MS. gave biographical sketches of celebrated painters who had flourished in England several centuries ago, and of whose existence Walpole had never dreamed. Walpole, put off his guard, answered his unknown correspondent at once; expressed his delight at receiving the MS.; and desired, as a personal favour, that all the other antique writings, poems included, mentioned in the note, should be forwarded. C., highly elated, immediately sent accounts of a great many more painters and poets, and also gave some slight sketch of his personal history. On receipt of this second communication, Walpole suspected a trick. The poems he shewed to Mason and Gray, who at once pronounced them forgeries; he then wrote C., expressing his suspicions as to the genuineness of the MS., and administering at the same time a great deal of excellent advice. C. replied, desiring that the MS. should be returned at once; but by the time the letter reached London, Walpole was about to start for Paris, and it was allowed to remain unanswered. On Walpole's return some six weeks thereafter, a fierce note from C. waited him, the contents of which must have brought the blood to his polished and urbane brow; indignant, he bundled up the MS., and returned it without a word of explanation. From his earliest youth, C. had a ghastly familiarity with the idea of suicide. Among his papers preserved in the British Museum, is a last will and

testament, 'executed in the presence of Omnicience, the 14th of April 1770,' full of the wildest wit and profanity. Another document of similar purport, falling into the hands of his friends, led to his dismissal from Mr Lambert's office. Released from what he considered the slavery of law, C.'s eyes turned to London, and in that city he arrived, carrying with him all his Rowley MS. and several modern poems, on Tuesday the 24th April 1770, and took up his abode with one Walmsley, a plasterer, in Shoreditch. No sooner had he settled there, than he began to work as with a hundred hands. During the last few months of his life, he poured forth squibs, satiric poems, political essays, burlettes, letters in the style of Junius, and meditated writing a history of England, to appear in parts. For a time, his prospects seemed golden enough. He obtained an introduction to Lord Mayor Beckford; he sent glowing letters home, accompanied by presents to his mother and sisters. Ultimately, he left the plasterer's in Shoreditch, and took lodgings in Brooke Street, adjoining Holborn. Unhappily for C., editors of opposition papers were willing enough to insert and praise his articles, but were disinclined or unable to render an equivalent in cash. Possibly they conceived that a patriotism so ardent must be its own reward. The means of life were now fast failing. In desperation, he attempted to procure an appointment of surgeon's mate in a vessel going to Africa, but failed. This was the last drop that made the cup overflow. On Saturday the 25th August, his landlady, alarmed that her lodger did not make his appearance, had the door of his room broken open; saw the floor littered with small pieces of paper, and C. 'lying on the bed with his legs hanging over, quite dead.' Just at this time, Dr Fry of Oxford, who had seen or heard something of the Rowley poems, was on the eve of starting for Bristol to make inquiry into the matter. Sad enough to think on now: a little more promptitude on the one hand, a little more patience on the other, and the whole catastrophe might have been averted.

C. died before he reached his 18th year, and takes his place as the greatest prodigy in literature. Indeed, in our judgment of him, age cannot be taken into account. He never seems to have been young. His intellect was born fully matured. He was equally precocious in other respects. In his letters, he speaks of the relation of the sexes in the tone of a sated *roué*. He never seems to have felt the delicious shame and ingenuousness of youth; over his heart never was outspread 'the bloom of young desire and purple light of love.' The *Kew Gardens* is written in the style of Churchill, and it possesses all that master's vigour, and every now and then we come on a couplet turned with the felicity of Pope. His genius, however, is in its greatest perfection in the ancient poems. No poet, before or since, has written a tenderer strain than the lament in *Alla*, or conceived a bolder image than the personification of Freedom in the ode to Liberty in his *Tragedy of Godwin*. C.'s life has been written by many hands, but the best and most sympathetic sketch of it is that given by Professor D. Masson of Edinburgh University in his collected essays.

CHAUCER, GEOFFREY, the father of English poetry, was born, if we may credit tradition, in 1328, and, from a passage in the *Testament of Love*, his birthplace seems to have been London. The deepest obscurity rests on his early history. It has been said that he studied at Cambridge, and afterwards removed to Oxford. While at the university, he wrote *The Court of Love*, and *The Book of Troilus and Cressende*. At one period he seems

to have turned his attention to law, and to have become a member of the Inner Temple. About these matters his biographers, knowing little, have conjectured much. The only particular of C.'s youth of which an anxious posterity can be certified is, that he one day thrashed a Franciscan friar in Fleet Street, and was fined two shillings for the exploit on the next. History has preserved this for us, but has forgotten all the rest of his early life, and the chronology of all his poems.

In 1359, C. assures us, on his own authority, that he served under Edward III. in his French campaign, and was therein made prisoner. The date of his return from captivity, and of his subsequent marriage, cannot now be ascertained. He espoused Philippa, youngest daughter of Sir Payne Roet, whose estates lay in Hainault. His wife's sister, Katherine, ultimately became the wife of John of Gaunt, Duke of Lancaster; and it may be presumed that the high connection thus established aided, in no inconsiderable degree, the poet's advancement in life. After his marriage, he began to mix in public affairs. He was sent on an embassy to Genoa in 1372, and, on that occasion, has been supposed by some to have had an interview with Petrarch, then residing at Padua, and to have heard from his lips the story of *Griselda*. On his return, he was appointed comptroller of the customs for wools, and in the same year the king granted him a pitcher of wine daily for life. In 1377, C. proceeded to Flanders in the retinue of Sir Thomas Percy, afterwards Earl of Worcester; and for several years thereafter he was employed assiduously in embassies and other business connected with the public service. In 1386, a commission was issued to inquire into alleged abuses in the department of the customs, and C. was dismissed from his comptrollership in the December of that year. On meeting this fact, one cannot help remembering that Edward made the writing out of the accounts in C.'s own hand the condition of his holding office. Had the great poet neglected his duties? It has been conjectured by some, that after his disgrace C. became embarrassed in circumstances, and apparently with reason, for about this time he cancelled both his pensions, and consigned them to one John Scalby, 'to whom they were probably sold under pressure of distress,' says his latest biographer. In 1387, C. lost his wife. Where he spent his closing years, cannot now be ascertained. Godwin surmises that in his distress he retired to Woodstock, and composed there *The Canterbury Tales*. It seems, however, to be tolerably certain that during the last years of his life he was resident in London. There he died on the 25th October 1400, aged 74, and was buried in Westminster Abbey, the first of the long line of poets whose ashes make that pile so venerable.

C. was a worthy representative of the splendid 14th century. He was a master of the science, the theology, and the literature of his time. He had seen many men and cities, and had formed no inconsiderable unit in imposing ceremonies of state. His poems are numerous, and exhibit every variety of poetical excellence. His earlier performances, such as *The Flower and the Leaf*, *The Romaunce of the Rose*, are, after the French fashion then prevalent, gorgeous allegories full of queens and kings, bowers, bevyes of beautiful ladies, brave knights, and pious nightingales that sing the praises of God. They appeal potently enough to the eye, but they do not in the slightest degree touch the heart, or relate themselves to human concerns. Quite different *The Canterbury Tales*, so full of humour, pathos, and shrewd observation. In these Tales, English life, as it then existed, is wonderfully reflected—when the king tilted in tournament, when the knight and the

## CHAUDES-AIGUES—CHEDDAR.

lady rode over the down with falcon on wrist, when pilgrimages bound for the tomb of St Thomas passed on from village to village, when friars sitting in tavern over wine sang songs that formed a remarkable contrast with the services they so piously and sweetly intoned. All that stirring and gaily appalled time—so different from our own—is seen in C.'s work, as in some magic mirror; and in his case, as in every other, when the superficial tumults and noises that so stun the contemporary ear have faded away, leaving behind that which is elemental and eternal, the poet is found to be the truest historian. Among C.'s other writings may be mentioned, *The Court of Love*, *The Book of Troilus and Cressida*, *Parliament of Birds*, and the *Book of the Duchess*. The *Canterbury Tales* were printed by Caxton, but the first edition of his complete works did not appear till 1542.

**CHAUDES-AIGUES**, a town of France, in the department of Cantal, about 12 miles south-south-west of St Flour. It is celebrated on account of its hot mineral springs, which have the property of discharging grease from sheep's wool, and vast numbers of fleeces are sent hither annually to be washed. The waters are also taken for rheumatism and cutaneous diseases. Pop. (1872) 1100.

**CHAUDFONTAINE**, a village charmingly situated in the valley of the Vesdre, a few miles from Liège, in Belgium, and celebrated for a hot spring which supplies water for hot-baths. There are hotels and lodging-houses for the accommodation of visitors. The place is a favourite resort of the Liégois. There is here a station on the railway from Liège to Aix-la-Chapelle.

**CHAUDIÈRE**, the name of a river and of a lake of Canada. The river joins the St Lawrence from the south, about 7 miles above Quebec, forming the celebrated falls of its own name, about 2½ miles from its mouth. The lake—merely one of the many expansions of the Ottawa—has on its right the city of that name, the metropolis of the united colony.

**CHAUMETTE**, PIERRE GASPARD, one of the most extravagant characters of the French Revolution, was born, 1763, at Nevers, and made his first public appearance at the Cordeliers Club, where he was introduced by Camille Desmoulins. His 'sans culottism' gained for him such popularity, that he was appointed procurator of the community of Paris, in the place of Manuel. C. was very enthusiastic in favour of the 'worship of reason.' In his zeal, he rejected his own Christian name, Pierre, as having been sullied by saintly associations, and styled himself 'Anaxagoras.' The institution of the tribunal of the revolution, the decree for a revolutionary army, and the law against suspected aristocrats, were carried into effect by C. along with others. He also proposed that the whole French nation should be made to wear wooden shoes, and to subsist on potatoes; but this was too much even for the chimerical enthusiasm of his compatriots. His antics, however, in connection with the 'worship of reason,' excited the disgust of Robespierre, who devised measures for bringing the whole company of actors under Hébert at the scaffold. C. was arrested and imprisoned on a charge of having been implicated in a plot against the Convention, and was executed, April 13, 1794.

**CHAUMONT**, a town of France, in the department of Haute-Marne, on an elevation between the rivers Marne and Suize, about 140 miles south-east of Paris. It is generally well built, with clean, spacious streets, and fine promenades round the upper part of the town. There are considerable

manufactures, including hosiery, cotton yarn, gloves, &c. On the 1st of March 1814, the allied powers here bound themselves by treaty against Napoleon, in the event of the negotiations at Châtillon ending unsatisfactorily. Pop. (1872) 7984.

**CHAUNY**, a town of France in the department of Aisne, about 18 miles west-north-west of Laon. It is built partly on the right bank of, and partly on an island in the river Oise, which is here navigable. It is an old, rather uninteresting place, with manufactures of sackings, hosiery, chemicals, and leather, and an active trade. Pop. (1872) 8333.

**CHAUSSES**, in the armour of the middle ages, were defence-pieces for the legs. Some were made of padded and quilted cloth, with metal studs; some of chain-mail; some of riveted plates; and some of banded mail. It was not unusual to fasten them by lacing behind the leg.

**CHAUX DE FONDS**, a town of Switzerland, in the canton of Neuchâtel, 9 miles north-west of the city of that name. It is situated in a bleak valley, at an elevation of 3070 feet above the sea, and is scattered over a large area, almost every cottage being surrounded by a garden or croft. It is one of the chief seats of the manufacture of clocks and watches in the canton. The mechanists work chiefly at home, each devoting himself to a particular portion of machinery. In 1851, the number of watches made was 156,000. Population. (1871) 19,930.

**CHAY ROOT**, **CHOYA**, or **SAYAN** (*Oldenlandia umbellata*), a perennial herbaceous plant of the natural order *Cinchonaceæ*, said to be a native both of India and of Mexico. It is cultivated on the coast of Coromandel for the sake of its long, orange-coloured roots, the bark of which affords a beautiful red dye. The quality of the bark is said to be improved by keeping it for some years. It is the colouring matter obtained from C. R. which is used to paint the red figures on chintz. C. R. is the Indian madder, and in it some tribes in Ceylon formerly paid their tribute.

**CHAYENPU'R**, a fortified town of Nepaul, in the north of India, about 120 miles to the east of Khatmandu, the capital of the state, being in lat. 27° 20' N., and long. 87° 3' E. It is the chief town of a district which yields rice, wheat, cotton, ghee or butter, timber, spices, sugar, tobacco, and pearls.

**CHEATING**. In the technical language of the English law, C. means the offence of fraudulently obtaining the property of another by any deceitful or illegal practice short of felony, but in such a way as that the public interest may possibly be affected. In order to constitute C., the fraud must be of such a kind as that it could not be guarded against by common prudence. C., in this sense, is an offence at common law, and indictable, which is not the case with imposition in a private transaction. The law of Scotland has no such distinction. See **WEIGHTS AND MEASURES**, **FALSY PRETENCES**, **CHARACTER TO SERVANT**.

**CHECK**, a variegated cloth, the pattern of which consists of rectangular spaces like a chess-board (Fr. échec, chess), either in black and white, or of various colours.

**CHE'CKY** (Fr. échiqueté). In Heraldry, when the field or any charge is composed of small squares of different tinctures, generally metal and colour, it is said to be checky.

**CHE'DDAR**, a village in Somersetshire, on the south side of the Mendip Hills, 2 miles south-east of Axbridge, with a level country to the south. It lies at the entrance of a deep rocky gorge, nearly 1 mile long, overhung by stupendous mural limestone

precipices, containing caverns—one being 300 feet long—filled with fantastic stalactites and stalagmites. The celebrated C. cheeses are produced on the rich grass-farms around. The church is supposed to have been built about 1400, and has a sculptured stone pulpit. Population of parish, 2200.

**CHEDUA**, an island off Aracan, in the Bay of Bengal, stretching from lat.  $18^{\circ} 40'$  to  $18^{\circ} 58' N.$ , and from long.  $93^{\circ} 31'$  to  $93^{\circ} 50' E.$  Its area is about 250 square miles, and its population 9000. Along with the adjacent mainland, it was ceded to the British at the close of the first Burmese war. The soil is fertile, yielding rice, tobacco, sugar, indigo, cotton, hemp, and large quantities of a vegetable oil, equally fitted for burning and for varnishing. The principal mineral is petroleum. The coast presents earthy cones, which emit mud and gas, and about 100 years ago a severe earthquake is believed to have extended the limits of the island.

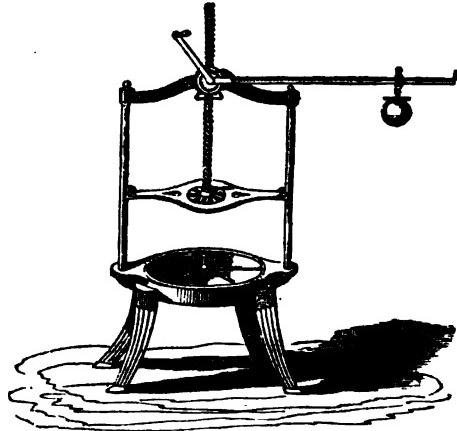

**CHEESE** is the common form in which the Caseine (q. v.) of milk is used in a separate state as an article of food. In new milk, the C. is present in a condition soluble in water, and is generally separated therefrom in a coagulated or clotted form, on the addition of a little rennet (q. v.). In the preparation of C., the milk is gently heated to a temperature of  $110^{\circ}$ — $112^{\circ} F.$ , and placed in a large wooden tub, where the rennet is added, and the operation of *earning* goes on. In about half an hour, the curd is sufficiently formed. The liquid whey being pressed out, the curd is chopped into small pieces of the size of a walnut by a knife, called a curd-cutter, salt is added, and the fragments of curd introduced into a cloth placed in a cheese-vat or cheesart, which is a wooden tub of varying size and shape, perforated at the sides and bottom. The whole is then put under a cheese-press (q. v.), and subjected to great pressure, which consolidates the curd or caseine, and at the same time squeezes out the remaining portions of whey. After two or three hours, the half-formed C. is turned and re-turned, each time being subjected to renewed pressure, till in about two days it is sufficiently compacted. It is then removed from the cheese-vat, and placed on a shelf in a dry airy room, where, being repeatedly turned, it gradually dries, and gets aged or seasoned sufficiently for market in about six months.

There are many varieties of C., which partly owe their difference to the food of the cows, but in greater part to differences in the mode of treating the milk. *Skinned-milk C.* is prepared from milk from which the cream has been removed, and a rich colour is communicated by adding a little Arnotto (q. v.) to the milk before coagulation. *Sweet-milk C.* is procured in a similar manner from the whole milk, and contains much of the butter along with the caseine. *Stilton C.* is made in Leicestershire, by adding the cream of the evening's milk to the new milk of next morning; and as there is always more trouble in expelling the whey from curd containing butter, there is a difficulty in preparing this variety of C., from its liability to fermentation and bursting. *Cheddar C.* is made in Somersetshire, from the whole milk, and the whey is several times skimmed off, heated, and added to the curd to scald it. *Cheshire* and *Double Gloucester* are made from the whole milk; *Single Gloucester*, from half new milk and half skinned milk. *Gouda C.* is prepared in Holland from skinned milk curdled by muriatic acid instead of rennet, and for this reason it is not infested with mites. *Suffolk C.* is made from skinned milk, and so is *Parmesan C.*, obtained from Parma in Italy, which owes its fine rich flavour to the superior

herbage on the banks of the river Po. *Swiss C.* is flavoured with herbs, and especially that of Gruyere, which is very pleasant to the taste. *Cream C.* is prepared from cream curd which has been placed in a cloth, and allowed to drain without the assistance of pressure. Bath and York supply C. of this description. In the fabrication of C., minium or red-lead has occasionally been employed as a cheap colouring substance, and cases of poisoning have resulted therefrom. Carrots, saffron, and marigold flowers have also been used for imparting colour as well as flavour.

When sufficiently dry for use, C. still retains from 35 to 44 per cent. water, and besides the caseine contains a greater or less proportion of oil or fat and saline matter—the latter mainly consisting of common salt, originally present in the milk, and added during the manufacture of the cheese. As an article of diet, C. is highly nutritious; but from its coactive properties, it is mainly used as a condiment in small quantity after an ordinary meal, and is then serviceable in giving an impetus to the process of digestion. To serve the purpose of a digester, C. must be old and partially decayed, or mouldy. It then acts as leaven, and causes chemical changes gradually to commence among the particles of the food which has previously been eaten, and thus facilitates the dissolution which necessarily precedes digestion.

**CHEESE PRESS.**—The old method of compressing curd and expelling the whey from it is still employed in many places, the mere piling of weights on the cheese-vat. Sometimes the action of a screw is employed. Among improved dairy implements are now reckoned, however, many ingenious and elegant forms of cheese press, generally depending on the

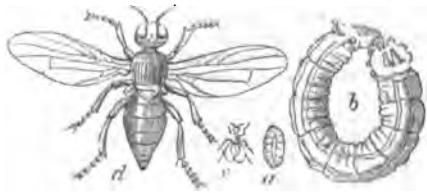

Cheese Press.

action of a lever. They are much more convenient than the clumsy contrivances which they have superseded, but no essential change has been introduced by them in the art of cheese-making. Factories for the manufacture of cheese have been established in the United States and Canada, by which cheese is produced in immense quantities, and a factory on a similar principle has been lately established in Derbyshire.

**CHEESE-HOPPER**, the larva of *Piophila casei* or *Tyrophaga casei*, a small dipterous (two-winged) fly, of the large family *Muscidae*, the same to which the house-fly, blow-fly, &c., belong. The perfect insect is about a line and a half in length, mostly of a shining black colour; antennae, forehead, and some

parts of the legs rufous. It is a pest of dairies and store-closets, laying its eggs in cracks or crevices of cheese, the destined food of its larva. To preserve cheeses from this pest, it is of advantage to brush or rub them frequently, and to remove all

Cheese-hopper :

a, larva, natural size; b, larva, magnified, preparing to spring; c, perfect insect, natural size; d, magnified.

cracked or injured cheeses from large stores, besides keeping them dry and in a well-aired place. The same rules are applicable to their preservation from the other insect larvae by which they are sometimes infested, of which the most notable are those of the Bacon Beetle (see DERMESTES), and of another species of dipterous fly, *Musca corvinæ*.

CHEETAH, CHITTAH, or HUNTING LEOPARD (*Felis jubata* or *Cynailurus jubatus*), an animal of the feline family, but differing from all the

Cheetah.

rest of that family in its longer and narrower feet and less retractile claws, which are also more blunt and less curved. With these peculiarities are associated a greater length of limbs than is usual in feline animals, adapting it to take its prey by running rather than by leaping, and an intelligent and tractable disposition, constituting an additional point of resemblance to dogs; with which, however, the form of the head and the internal anatomy have nothing in common, but are entirely feline. The C. is in size about equal to a leopard, but the body and limbs are longer. It is very widely distributed, being found in Senegal, South Africa, Persia, India, Sumatra, &c. Its geographic range extends as far north as the Caspian Sea, and the steppes of the Kirghis Tartars. The Asiatic species described as *Felis venatica* appears to have been fully identified with *F. jubata*; and differences in the quantity of mane, and other unimportant particulars, may probably sometimes have resulted from domestication; for this animal has been long domesticated and employed in the chase, both in Persia, where it is called *Youse*, and in India. Deer and antelopes are the game principally hunted with the C., and packs are kept by Indian princes. The

head of the C. is kept covered with a leather-hood till the game is discovered, when the hunting party, advancing cautiously to within 200 yards of it, the hood is taken off, and the C. stealthily creeps towards the herd, taking advantage of every bush and inequality for concealment, till, on their shewing alarm, he is amongst them at a few bounds, and striking down his victim with a blow of his paw, instantly tears open its throat, and begins to suck the blood. It is then somewhat difficult to withdraw him from his prey, which is generally done by offering him meat. If unsuccessful, the C. does not attempt to follow the herd by running—nor does this animal seem to possess the power of maintaining speed through a lengthened chase—but slowly, and as if ashamed, creeps back to the hunters. The C. is not unfrequently to be seen in menageries in Britain. In a domesticated state, it is extremely fond of attention, and seems to repay kindness with affection. The skin is frequently imported from Africa.

#### CHEIRANTHUS. See WALLFLOWER.

CHEIRO'LEPIS, a genus of fossil ganoid fish, peculiar to the Devonian measures, in which eight species have been found. They had large heads, the spine continued in a rudimentary condition, and the body was completely covered with small lozenge-shaped ganoid scales. The first ray of each fin was converted into a strong spine, whose base was loosely imbedded in the flesh. The pectorals and ventrals were largely developed, while the dorsal was small, and situated behind the anal fin. The generic name, meaning 'scaly-hand,' was given in allusion to the large scaly pectorals.

CHEIROMANCY (Gr. *cheir*, the hand; *manteia*, prophecy), or PALMISTRY, a form of divination that professes to read the destiny of an individual by the lineaments of the hand. In the middle ages, C. occupied the attention of Cardan, Paracelsus, and other eminent men, who elaborated it into a system. It is now, however, the exclusive property of the gypsies, who still find among maid-servants sufficient credulity to make its practice profitable.

#### CHEIROMYS. See AYE-AYE.

CHEIRONECTES, a genus of marsupial quadrupeds, differing from the opossums chiefly in having webbed-feet and aquatic habits. *C. palmarum* or *C. Yapock*, sometimes called the Yapock Opossum, or simply the Yapock, from the South American river of that name, is common in many rivers of Brazil and Guiana. It has a soft woolly fur, the colour of the upper parts of the body is gray, with large transverse patches of black, connected with a dorsal black line, the breast and belly white; the tail is long, very thick at the base, tapering to the tip, and, except at the base, covered with scales. The cheek-pouches are very large. Crustaceans are said to form the chief food of this animal, which is interesting as a sort of marsupial representative of the otter.

#### CHEIRO'PTERA. See BAT.

CHEIROTHERIUM, the name given by Dr Kaup to the animal which produced the peculiar hand-like impressions (hence the name, 'hand-beast') on the Triassic rocks of this country and Germany. The remains of the animal having been found, and its structure made out, this name has given place to the more characteristic one of *Labyrinthodon* (q. v.).

CHEKE, SIR JOHN, who deserves to be remembered as one of the revivers of classical literature in England during the 16th c., was born at Cambridge, June 16, 1514. Entering the university of Cambridge,

Latin and Greek, particularly the latter language, then much neglected in England. He laboured earnestly to advance the study of the Greek language and literature; and when the first professorship of Greek was founded in Cambridge by King Henry VIII., about 1540, C. was appointed professor. A new mode of pronouncing Greek which he introduced was assailed by Bishop Gardiner, the chancellor of the university; but notwithstanding, C.'s system prevailed. C. was for a time preceptor of the Prince, afterwards Edward VI., whose elevation to the throne secured him rank, wealth, and honour. But being a Protestant, he was stripped of everything when Mary came to the throne, although other lands were given to him on his returning to the Roman Catholic Church, which he did to escape burning, the only alternative offered him by Cardinal Pole. His recantation preyed on his mind so much, that he died in the course of the following year, September 1557. He left several works in Latin, and a pamphlet in English; and among his MSS. was a translation of the Gospel by Matthew, exemplifying a plan for reforming the English language by eradicating all words save those derived from Saxon roots.

CHE-KEANG, one of the eastern and maritime provinces of China, the smallest of the eighteen. Situated in the southern portion of the great plain, it is possessed of great fertility, and produces silk, tea, and rice in abundance. Its capital, Hang-chow (q. v.), an important and populous city, is the metropolis of the silk districts. 'Above is Paradise,' say the Chinese; 'below are Soo-chow and Hang-chow.' Both these places were taken by the Taiping rebels in 1860. Ning-po (q. v.) is the principal port of the province. Pop., according to the Chinese census of 1812, 26,256,784. Area, 39,150 sq. m.

CHELI'CERAE, or antennal claws, modified antennae, which, in some of the Crustaceans, and in most of the Arachnida, serve a purpose corresponding with that of the mandibles of insects in the cutting, tearing, or bruising of food. They move, however, up and down, in a direction contrary to that of the mandibles of insects.

CHELMFSFORD, the county town of Essex, near the centre of the county, at the confluence of the Chelmer and the Cann, 29 miles north-east of London. The industry of C. is chiefly agricultural. The town is the seat of assizes and local courts, and has a grammar-school founded by Edward VI. Pop. (1871) 9318. On a small island called Mesopotamia, in the Chelmer, there has long been a ludicrous mock-election of a member of parliament during the county elections.

CHELO'NIA (Gr. *chelone*, a tortoise), an order of Reptiles, corresponding in extent with the genus *Testudo* of Linnaeus, and of which the most obvious distinguishing character is the enclosure of the whole body in a protective covering connected with the skeleton, so that only the head, the tail, and the limbs are protruded; the limbs being four in number, and all formed on the same plan, in some as feet for walking on dry ground, in others as paddles for swimming. The bony covering consists of two principal parts, called the *carapace* and the *plastron*; the carapace serving as a buckler for the upper parts, and the plastron for the under parts of the body. The carapace is formed from the ribs, of which there are eight pair, and from the annular parts of the dorsal vertebrae, expanded into plates, which are joined to each other by dentated sutures, so that the whole acquires great firmness, and the dorsal vertebrae are rendered immovable. The plastron is formed of pieces which represent the sternum

788

number. So compact and strong is the case of some of the tortoises, that it will bear immense pressure without injury, the arched form of the carapace adding to its strength; whilst the creature, destitute of other means of defence, and incapable of flight, finds safety, at least in its mature state, from all enemies but man, by drawing its head, tail, and limbs within the protecting case, which in some, called Box-tortoises, has certain plates movable, so as more completely to enclose them. The turtles and other aquatic chelonians cannot thus withdraw their head, tail, and limbs from danger, but the greater activity of their movements compensates for this.

The firmly fixed ribs not admitting of the movements by which respiration ordinarily takes place in other vertebrate animals, the C.gulp down air, which they inhale entirely through the nostrils; first filling the cavity of the mouth by elevating the hyoid bone, and then, by depressing it, forcing the air into the lungs, whilst the inner aperture of the nostrils is closed by the tongue. In other respects, as to aeration and circulation of blood, they resemble other reptiles.

The jaws are not furnished with teeth, but act in a manner more resembling that of the mandibles of birds, being like them hard, sharp, and horny. The food of the C. is various. Some of them, among which are all the land-tortoises, subsist exclusively on vegetable food; some of the aquatic C. pursue and eat other aquatic animals.

All the C. are strictly oviparous. Their eggs are hatched by the heat of the sun alone; they lay a great number at a time, which are covered with a calcareous shell, like those of birds. The eggs of fresh-water tortoises are in some places a lucrative article of commerce, from the quantity of oil which is obtained from them.

The C. are found only in the warmer parts of the world, but their numbers in some places are astonishingly great. None of them can properly be reckoned British, although stray turtles have, in a few instances, been found on the British shores. A few species occur in the southern parts of Europe, and some are found in the temperate parts of North America.

All the species are extremely tenacious of life; they are capable of extraordinary abstinence, and of living long after having sustained injuries which would have been immediately destructive to almost any other animal. They are also remarkable for their longevity.

The flesh of some kinds of turtle is well known as an excellent article of food. The eggs of some are equally esteemed delicacy. Tortoise-shell (q. v.), and the oil already mentioned, are the only other valuable products of the order.

Further information concerning the C. will be found in particular articles devoted to some of the different genera and species. See also RAPTOR.

Fossil *Chelonia*.—Foot-tracks on the Triassic sandstone of Dumfriesshire were referred by their discoverer, Dr Duncan, to tortoises. Similar tracks have been noticed in Devonian and Oolite strata. Their vagueness, however, does not indicate with any certainty the animals which produced them. The first indisputable evidence of chelonian life occurs in the Upper Oolite, where the remains of several pond-tortoises and two or three turtles have been observed. In the newer deposits, they increase in number, so that between 70 and 80 species have been described from the Tertiary strata. In the Eocene deposits of the London Clay, at the mouth of the Thames, there occur the remains of more species of true turtles than are now known to exist.

## CHELSEA—CHEMICAL NOMENCLATURE.

in the whole world. Some of these fossil C. were of a size proportioned to their colossal companions; as, for instance, the gigantic Land Tortoise (*Colossochelys*) of the Sewalik Hills, whose carapace was as much as 20 feet in length.

CHELSEA, a suburb of London, in Middlesex, on the left bank of the Thames,  $4\frac{1}{2}$  miles west-south-west of St Paul's. The river is here crossed by a fine iron bridge. Pop. (1871) 258,050. Many of the nobility and gentry formerly resided at C., and some of its coffee-houses were much resorted to by pleasure-parties in the 17th and 18th centuries. C. has water-works to supply London, a chain-pier, and floor-cloth factories, besides a training-college for male, and another for female teachers, and the Cremorne House Gardens, now a place of public amusement.

CHELSEA HOSPITAL is an asylum for disabled or superannuated soldiers. The building was commenced in 1609, as a Protestant theological seminary, by Dr Matthew Sutcliffe, Dean of Exeter; and James I gave it a charter in 1610, as *King James's College*. When Sutcliffe died, in 1629, the building was less than half finished, and the students were only 15 in number. Shortly after this, the scheme was abandoned, and the building used for various purposes. It was then rebuilt, and made into an hospital for disabled soldiers by Charles II. By a warrant issued in 1684, one day's pay per year, and two in leap-years, was deducted from soldiers' pay, for supporting Chelsea Hospital. This deduction has long ceased: the hospital being maintained by parliamentary grant. The hospital has accommodation for about 600 persons besides officers. Attached to it are about 40 acres of land, used as public gardens and exercise ground. It is governed by a Board of Commissioners, comprising *ex officio* the Lord President of the Council, the First Lord of the Treasury, and the Secretaries of State; but the more immediate management is in the hands of about 120 persons, of whom 20 are military officers, 20 civil officers, and the rest subordinates.

The establishment is maintained for the *in-pensioners* of the British army, who, in the Army Estimates for 1873—1874, are set down at 538. These in-pensioners, besides board, lodging, clothing, washing, medical aid, &c., receive a small sum in money, varying from 5s. 3d. per week for a colour-sergeant, down to 7d. per week for a private soldier. They are all dressed in uniform—red, with blue facings—and are treated as a garrison, in respect to guards, sentinels, &c. There is a certain degree of choice open to the men, as to whether they will be *in* or *out* pensioners. The out-pensioners, who are more than a hundredfold as numerous as the others, receive sums of money varying from 1d. to 3s. 7½d. per day for life, as a reward for past services. Vacancies in the hospital are filled up once a quarter; and every person admitted must give up his out-pension before he can become an in-pensioner. The cost of the hospital is about £29,731 for 1873—1874. This is exclusive of *out*-pension charges. Doubts have frequently been expressed as to the usefulness of this expenditure; it is exceptional in its character, and the arrangement to which it refers is not in much favour among the soldiery.

CHELTENHAM, a town, parliamentary borough, and fashionable watering-place, in the county of Gloucester, eight miles north-east of Gloucester. It lies in a picturesque and healthy valley on the Chelt, a small stream which rises in the adjacent hills, and flows into the Severn. It is sheltered on the east and south-east by a semi-circle of the Cotswolds. It owes its celebrity and

rapid increase to its mineral springs, of which there are several varieties. The chief street is upwards of a mile long, right and left of which are spacious and elegant squares and crescents, and innumerable villas lately erected for the accommodation of the numerous visitors. Attached to the spas are handsome pump-rooms—with tasteful grounds, avenues, saloons—lodging-houses, and public promenades among the finest in England, besides many fine mansions in and around the town. It has 10 churches and a number of dissenting chapels. Of late years, C. has become famous for its public schools, the oldest of which is its endowed grammar-school, capable of educating 300 scholars; but the largest, and now the most celebrated, is its Proprietary College, for the sons of gentlemen, a noble institution, educating, upon an average, 600 pupils. There are also a Ladies' College, a Junior Proprietary School, and a number of private scholastic establishments. There are public assembly-rooms in the town; which is also much resorted to in winter for its hunting. It has two clubs, and five or six weekly newspapers. Pop. (1871) 44,519. C. returns one member to parliament. Its affairs are managed by a board of elected commissioners. It has no manufactures of any importance. C. was only a village in 1716, when the first spring was discovered. It gradually increased till 1788, when the benefit received by George III. from its waters suddenly made it a resort of fashion.

CHEMIC is the name given to BLEACHING POWDER by those engaged in chemical works.

CHEMICAL NOMENCLATURE AND NOTATION. (During the progress of the *Encyclopaedia*, the nomenclature and notation of chemistry were greatly changed; and an account of the new system was given in the SUPPLEMENT. What follows here is allowed to stand, as the old names and notation are still found in books in use, and are often used concurrently with the new.) In early times, chemical substances were named according to the fanciful theories of Alchemy (q. v.). Thus the name *flowers of sulphur* was applied to the sublimed sulphur, which grew or sprang like a flower from sulphur when heated; *spirit of salt*, to hydrochloric acid, the corrosive acid or spirit obtained from common salt; and a multitude of other names had a like fanciful origin. In 1787, Lavoisier founded the system of nomenclature which is followed still by chemists. At first, it was intended that the names of simple as well as compound substances should be regulated by system. Hence such terms as oxygen (from *oxus*, acid, and *gennao*, to produce), the *acid-producer*, given from the notion then held that no acid was without oxygen; and hydrogen (from *hydor*, water, and *gennao*, the *water-producer*, from the supposition that hydrogen had more to do with the formation of water than any other element. The advance of chemistry, however, has so completely changed the opinion of chemists regarding the simpler bodies, that such names are now found to mislead; and thereafter, though such as had been given on this system were retained, their meaning has been discarded, and the systematised nomenclature restricted to compound substances. A remnant of the system, however, still subsists at the present time, in making the scientific names of all the metals end in *um*. In the non-metallic elements, a close analogy exists between chlorine, bromine, iodine, and fluorine; and to indicate this, the common termination *ine* has been given; and for a similar reason, carbon, silicon, and boron, end in *on*. As a general rule, however, the chemical name of an elementary substance does not convey

any scientific meaning, and must be regarded as a simple mark or designation, analogous to the names of persons, which give no notion regarding their moral character or physical development. The ancient and more common metals retain their popular titles, such as gold, silver, and copper; but the more recently discovered metals have names given which end in *um*. The symbol of an element is obtained from the first letter of its Latin name, as O for oxygen; Pl for lead (Lat. *plumbum*). When the names of two or more elements commence with the same letter, a smaller letter or satellite is attached to one or more of these; such as S for sulphur, Se for selenium, and Si for silicon. For a complete table of the symbols of the elementary substances, see ATOMIC WEIGHTS.

The name of a compound substance generally indicates the elements of which it is composed. Thus the name oxide of iron indicates that the red powder (rust) is made up of oxygen and iron; the sulphuret of lead (galena), that it is composed of sulphur and lead. In all similar combinations—

Oxygen forms	Oxides.
Chlorine	Chlorides.
Bromine	Bromides.
Iodine	Iodides.
Fluorine	Fluorides.
Nitrogen	Nitrides.
Carbon	Carbides or Carburets.
Sulphur	Sulphides or Sulphurets.
Selenium	Selenides or Seleniurets.
Phosphorus	Phosphides or Phosphurets.

When two elements combine with each other in more than one proportion or equivalent (see ATOMIC THEORY and ATOMIC WEIGHTS), the names of the compound bodies are contrived so as to express this. The term protoxide is applied to a compound of one equivalent of oxygen with one equivalent of another element; deutoxide to a compound containing a larger proportion of oxygen than the protoxide; and trioxide when the oxygen is still further increased. The term *binoxide* is used when oxygen is present in the proportion of two equivalents to one equivalent of the other element; and *teroxide* when the proportion is as three to one. A *suboxide* contains less than one equivalent of oxygen; and a *peroxide* is the highest oxide not possessing acid properties. The same prefixes are applied to the compounds of chlorine, sulphur, &c.

When one element combines with another to produce several compounds possessing acid properties, various terminations are employed to distinguish the compounds. Thus oxygen combined with a number of the elements to produce with each a series of acid compounds, the more highly oxidised of which receive the termination *ic*, whilst those containing less oxygen end in *ous*. Thus, sulphuric acid contains three equivalents of oxygen to one equivalent of sulphur; and sulphurous acid, two equivalents of oxygen with one equivalent of sulphur. These terminations are qualified by the use of the prefixes *hypo* (under) and *hyper* (over). Thus *hyposulphuric* acid is applied to a compound containing less oxygen than the sulphuric acid, and *hyposulphurous* to one with less oxygen than sulphurous acid.

When acids combine with bases or metallic oxides to form salts, they produce compounds, the names of which are influenced by the terminations of the acids. Thus, sulphuric acid and soda form the sulphate of soda; sulphurous acid and soda, the sulphite of soda; and *hyposulphurous* acid and soda, the *hyposulphite* of soda. In the same manner, nitric acid with potash forms the nitrate of potash, whilst nitrous acid and potash produce the nitrite of potash.

If a symbol be employed alone, it represents one

equivalent of the element. Thus, O signifies one equivalent, or eight parts by weight, of oxygen; C, one equivalent, or six parts by weight, of carbon; H, one equivalent, or one part by weight, of hydrogen. The combination of two elements is represented by placing the symbols for those elements side by side; thus, HO signifies one equivalent of hydrogen and one equivalent of oxygen in a state of chemical combination (*viz.*, water); and NaCl is one equivalent of sodium (Lat. *natrio*) united with one equivalent of chlorine (*viz.*, common salt).

When two or more equivalents of one element unite with one or more equivalents of another element, the number of such equivalents is signified by a small figure being placed immediately after the symbol of the element so multiplied. Thus, HO<sub>2</sub> represents one equivalent of hydrogen in combination with two equivalents of oxygen (peroxide of hydrogen); MnO<sub>2</sub> is one equivalent of manganese with two of oxygen (black oxide of manganese); Fe<sub>2</sub>O<sub>3</sub> is two equivalents of iron with three equivalents of oxygen (rust); and Pb<sub>2</sub>O<sub>3</sub> is three equivalents of lead with four equivalents of oxygen (red lead).

In expressing the formula of a compound substance, the symbol of the metal or its analogue is placed first in order, and is succeeded by the oxygen, chlorine, or similar element. Thus, the symbol for the chloride of mercury is always written HgCl, never ClHg. The same order is carried out in the construction of the formulae of more complex substances; the metallic half is placed first. Thus, sulphate of iron-containing sulphuric acid and the oxide of iron—is always expressed as Fe<sub>2</sub>SO<sub>4</sub>, never SO<sub>4</sub>FeO. In other words, the symbols are written in the order in which the substances would be named in Latin.

In the construction of the formulas of complex substances, the comma (,) and plus sign (+) are often introduced; the former to separate the symbols of substances which are closely united together, and the latter to form a line of demarcation where the components are less intimately combined. Thus, Fe<sub>2</sub>SO<sub>4</sub> + KO<sub>2</sub>SO<sub>4</sub> represents the compound of the sulphate of iron with the sulphate of potash; KCl + PtCl<sub>2</sub> is the double chloride of potassium and platinum.

Large figures placed at the left hand of a formula multiply all the symbols till a comma or plus sign appears. Thus, 3SO<sub>2</sub> represents three equivalents of sulphuric acid; 3PbO<sub>2</sub>A is three equivalents of oxide of lead, and one equivalent of acetic acid; and KO<sub>2</sub>SO<sub>4</sub> + Al<sub>2</sub>O<sub>3</sub>, 3SO<sub>2</sub> + 24HO (alum) is one equivalent of the sulphate of potash, with one equivalent of the sulphate of alumina, and 24 equivalents of water. When a compound substance requires to be multiplied, it is enclosed within parentheses, and a large figure placed immediately before it; thus, 3(KO<sub>2</sub>C<sub>2</sub>O<sub>4</sub>) + Fe<sub>2</sub>O<sub>3</sub>, 3C<sub>2</sub>O<sub>4</sub> + 6HO represents three equivalents of oxalate of potash, one equivalent of oxalate of iron, and six equivalents of water.

In expressing the formulas of organic compounds, the symbols are written in the following order: CHNO. Thus, turpentine is C<sub>10</sub>H<sub>16</sub>, alcohol is C<sub>2</sub>H<sub>5</sub>O<sub>2</sub>, and morphia is C<sub>18</sub>H<sub>21</sub>NO<sub>2</sub>.

Arbitrary symbols are occasionally used to represent important complex substances. Cyanogen is known as Cy; the organic acids are recognised by their initial letter with the sign (-) drawn above, as T for tartaric acid, C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>; A for acetic acid, C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>; and O for oxalic acid, C<sub>2</sub>O<sub>4</sub>; while the alkaloids are represented by their initial letter or letters with the sign (+) above; thus, Sr

for strychnine,  $C_{21}H_{14}N_2O_4$ ; Mo for morphia,  $C_{17}H_{21}NO_4$ ; and Q for quinine,  $C_{20}H_{24}N_2O_5$ .

Occasionally, in treatises on mineralogical chemistry, arbitrary modes of expressing the composition of minerals are resorted to, which it is not necessary here to explain. See CHEMISTRY, in SUPP., Vol. X.

CHEMISTRY is that branch of natural science which takes cognizance of the changes that bodies undergo when they are influenced by affinity (q. v.). Changes that do not alter the nature and properties of substances—such as the falling of a body by gravity, or its expansion by heat—belong to Physics or Natural Philosophy. In chemical changes again, the properties of the substances are permanently altered. Thus, when a piece of iron is left exposed to damp air, it is after a while converted into a reddish brittle substance (rust), owing to the union with it of the oxygen of the air. Chemistry, then, may be most simply defined as that branch of natural science which considers (1.) The combination of two or more substances to form a third body, with properties unlike either of its components; and (2.) The separation from a compound substance of the more simple bodies present in it: and considering that the steps of the combination and decomposition of substances can never be correctly understood without an intimate knowledge of the properties of substances, it follows that the science of C. must likewise take into notice the description of all the simplest as well as the most complex bodies.

When the science of C. is considered as a whole, including the properties of all the elements or substances, and the combinations and changes which they can under all circumstances undergo, it is distinguished by the title of *Pure, Theoretical, or Philosophical C.* Particular departments of C., where the science is confined to the examination of special objects, receive distinctive names: as *Physical C.*, or *Chemical Physics*, which considers phenomena bordering on natural philosophy and C.; *Mineralogical C.*, which takes cognizance of the composition of minerals; *Physiological C.*, which includes the changes which food undergoes in its transit through the animal economy, and the transformations that take place in organic substances generally; *Medical C.*, which considers the composition and compounding of medicines; *Agricultural C.*, which relates to the composition of soils and manures, the ingredients in plants, and the best modes of supplying the food they require, &c. *Inorganic C.* takes cognizance of dead matter, and the changes it undergoes, whilst *Organic C.* considers the substances obtained from plants and animals.

C. ranks as one of the arts as well as one of the sciences, and the division of *Practical C.* comprehends the rules and processes which must be followed, and the mechanical means which must be resorted to, for the successful prosecution of the art. Practical C. is subdivided into *Analytical C.* (q. v.), which is occupied with the separation of simple substances from more complex—as chlorine ( $Cl$ ) and sodium ( $Na$ ) from the chloride of sodium or common salt ( $NaCl$ )—and to the estimation of the quantities of the several ingredients; and *Synthetical C.*, which has for its object the union of simpler bodies to form more complex—as hydrogen ( $H$ ) and oxygen ( $O$ ) to form water ( $HO$ ). The art of *Assaying* (q. v.) is a department of analytical chemistry. *Applied C.* includes the art of manufacturing the various substances employed in commerce and in domestic life, so far as chemical processes and application are required. It is subdivided into *Technical C.*, which relates to everything connected with the arts and

manufactures; and *Pharmaceutical C.*, which takes cognizance of the substances used in medicine.

*History.*—The Egyptians appear to have possessed the greatest amount of chemical knowledge of all the nations of antiquity. They preserved dead bodies from decay (see MUMMY), fixed colours in silk by means of mordants, prepared many medicines and pigments, as also soap, beer, vinegar, metals and metallic alloys, common salt, vitriol, soda, sal-ammoniac, glass, enamel, tiles, and painted earthenware. The Chinese were very early acquainted with the processes for dyeing, and the preparation of metallic alloys, the fabrication of nitre, sulphur, gunpowder, borax, alum, porcelain, verdigris, paper, &c. From the Egyptians, the Greeks and Romans derived what chemical knowledge they possessed; but they added little or nothing; and when the migration of the northern tribes, and overthrow of the Roman empire, took place, a stop was put for a time to the advancement of all science in Europe. The prosecution of chemical knowledge was taken up by the Arabs before the 8th c., and was carried on by them and by their European scholars the alchemists with the results described under ALCHEMY. The first germs of a real science of C. seem to appear about the end of the 17th and beginning of the 18th c., in the speculations of Becher (q. v.) and the Phlogistic theory of Stahl (q. v.). After this, C. rapidly advanced. In 1718, Geoffroy brought out the first table of *Affinities*; in 1732, Boerhaave published many original experiments on the chemical relations of heat and light; in 1724 Hales, and in 1766 Black, published researches on the air and aërial form bodies, shewing that the carbonic acid evolved during fermentation, respiration, and by the action of acids on chalk, was different from atmospheric air. In 1754—1759, Margraff added to the then known earths—lime and silica—two others, alumina and magnesia; he also extracted sugar from plants. In 1770, Priestley began to announce his discoveries of oxygen, ammoniacal, hydrochloric, and sulphurous acid gases, &c. In 1773—1786, Scheele contributed chlorine, hydrofluoric, prussic, tartaric, and gallic acids; also baryta, phosphoric acid from bones, &c., and gave the first hints regarding a new doctrine of combustion. About the same time Bergman and Cavendish enlarged our knowledge of the gases. Lavoisier, between 1770 and 1794, re-organised much of the then known C., and founded a system of C. which still remains as the skeleton of the science. Berthollet, in 1787, contributed much to the doctrine of affinity, and made researches in chlorine, &c. Fourcroy and Vauquelin advanced organic C.; Klaproth gave many contributions to mineral C. Richter devoted himself to the doctrine of combining proportion, which was afterwards perfected by Dalton, as noticed under ATOMIC THEORY (q. v.). The discovery of galvanic electricity by Galvani, and its advancement by Volta, led Sir Humphry Davy, and others, to important researches in the metals and gases. Gay Lussac and Thenard advanced our knowledge regarding organic substances and the chemical relations of heat. Berzelius made laborious researches in mineral C., and gave an exactness to this department which is matter of astonishment to the chemists of the present day. He was also the author of the electrochemical theory, which has been almost perfected by the labours of Faraday, De la Rive, Becquerel, &c. Organic C. has latterly advanced most rapidly under the researches of Liebig, Wohler, Mitscherlich, Mulder, Laurent, and others. See ATOM, ATOMIC THEORY, ATOMIC VOLUME, ATOMIC WEIGHTS, AFFINITY. See CHEMISTRY, in SUPP., Vol. X.

CHEMISTS AND DRUGGISTS, LAWS RELATING TO. Under the head APOTHECARIES is

given some account of the Pharmaceutical Society of Great Britain; of its origin, in 1843, and of the modification of its constitution by the act of 1852. By that act it is provided that the Society shall have the right to examine candidates, and to confer on such as are found worthy the title 'Pharmaceutical Chemist.' As in the case of the medical practitioner, so also in that of the chemist and druggist, there is no penalty for mere practice; but the assumption of the title, which is characteristic of those qualified under the act, is punishable by fine. The legislature proceeded on the principle, that qualifications obtained by examination are to be regarded as certificates of a regular education, but that the freedom of engaging in business ought not on this ground to be interfered with; and that the right of the subject to consult whom he will in the one case, and to buy drugs from whom he will in the other, is one which must be respected. This seems a sound view. Serious mistakes, such as the substitution of one medicine for another, to the injury of the purchaser, are punishable by law, both in the unqualified and in the case of those qualified under the act. The public also derives great and increasing security in this and in all other departments of human enterprise, from the improving effect of free competition. The operation of the act was simply that of indicating to the public, by a name or title, a class of druggists possessing a higher education. In 1868, it was deemed necessary, owing to the frequent evils arising from the facility of obtaining poisons, to enact that no person should sell, or keep open shop for selling poisons, or assume or use the title of chemist or druggist or pharmacist, unless he be registered under the Act 31 and 32 Vict. c. 121, amended by 32 and 33 Vict. c. 117, and conform to the regulations as to sale of poisons. All persons who in 1868, carried on the business of chemists and druggists, and their apprentices and assistants, were entitled to be registered. The register of chemists and druggists under this act now contains the names of all qualified persons in Great Britain.

CHE'MITYPE is the name given by its inventor, C. Pil, a Dane, to the art of producing on a metal plate, by a chemical process, an engraving in relief. The outline of the process is this: On a polished plate of zinc an etching or an engraving is made in the usual way. The depressions of this design are then filled up with a melted metal—the nature of which is not revealed—and this super-added metal is then reduced to the exact level of the zinc, so that the design now appears as if inlaid. An acid is next applied to the surface, which attacks the zinc, without affecting the inlaid metal; and thus there results an exact copy in relief of the original intaglio engraving. In competition with wood-cuts, relief-lithographs, and copperplates, C. does not seem as yet to evince any great superiority; it fails especially in that character of strength and softness which wood-cuts express so well. The prints produced by this art look more like engravings than like wood-cuts. They have this advantage, however, that they give an exact copy of the original design made by the artists on the metal; whereas in wood-cutting the drawing made on the block may be impaired in its effect by the engraver. C. is particularly adapted for producing maps by the common printing-press. Pil practised his invention at first on a small scale in Copenhagen, from 1843 to 1846, and then extensively in Leipsic. In 1850, he went to Vienna, where he was employed in the imperial printing-establishment.

CHE'MNITZ, a town of Saxony, is situated at the base of the Erzgebirge, and at the confluence of

the river Chemnitz with three other rivers, in lat. 50° 50' N., and long. 17° 55' E. It is the principal manufacturing town of Saxony—its industry consisting in weaving cottons, woollens, and silks, and in printing calicoes, chiefly for German consumption. Cotton stockings are a most extensive manufacture, and rival the British in quality and cheapness. The American markets are chiefly supplied from this place. It has several extensive machine-factories, sending forth spinning machinery to all parts of the continent. For four centuries, C. was a free imperial city. It was fortified, but the walls have now been converted into promenades. Marks of the town's antiquity, however, are still seen in many of its buildings. Pop. (1871) 68,229.

CHE'MNITZ, MARTIN, next to Luther and Melancthon the most distinguished German Protestant theologian of the 16th c., was born at Treuenbrietzen, in Brandenburg, 9th November 1522; studied at Frankfurt and Wittenberg; and, in 1543, became rector of the cathedral-school of Königsberg. About 1550, he began to devote himself seriously to theology, and in 1553 went back to Wittenberg, where he delivered prelections on Melancthon's *Loci Communes*, from which sprang his own *Loci Theologici*, which, for method and learning, excels all similar books of the same age. In 1554, he was made a preacher in Brunswick, where he wrote his *Repetitio Sana Doctrina de Vera Presentia Corporis et Sanguinis Domini in Cana Sacra* (Leip. 1561), in which he defended Luther's view of the Lord's Supper against that of the Swiss reformers; the *Theologiae Jesuitorum Precipua Capita* (Leip. 1562); and the *Examen Concilii Tridentini* (Leip. 1565), a work in which he has argued with remarkable acuteness and learning against the dogmas of the Church of Rome. His *Corpus Doctrinae Prudentiae* (1566), written in conjunction with Mörlin, became a standard work of divinity among the Prussian Protestants. But his greatest ecclesiastical achievement was inducing the Saxon and Swabian churches to adopt as their confession of faith the *Concordia Formula*, and thus extending and consolidating the creed of Luther. He died at Brunswick, 8th April 1586.

CHE'MNITZIA, a genus of gasteropodous mollusca. It has a slender, elongated, many-whorled shell; the whorls striated; a simple semi-oval aperture; and a horny operculum. There are many recent species scattered all over the world. The discriminating character of the fossil species being taken from the form of the shell, it is more than probable that the remains of very different animals are classed under this generic name. No less than 180 species have been described, occurring throughout all the divisions of the fossiliferous strata from the Lower Silurian upwards.

CHE'NA'B, the largest, according to general opinion, of the five rivers which give name to the Punjab. Like most of the principal streams of India, it rises to the north of the Himalayas, making its way through the Ritanika Pass at the height of 13,000 feet above the sea, and having its source about lat. 32° 48' N., and long. 77° 27' E. After a descent of 300 miles, the C. reaches the level country. At the close of a course of the same length, it receives, on its right, the Jhelum in lat. 31° 12' N., and long. 72° 12' E.; 50 miles further down, it is joined, on its left, by the Ravee; and 110 miles lower, it absorbs, through the Ghara on its left, the mingled waters of the Beas and the Satlej. Lastly, at a distance of 60 miles, the accumulated floods, under the designation of Punjab, lose themselves in the Indus in lat. 28° 55' N., and long. 70° 28' E.—being still 470 miles from the ocean.

CHENOPODIA'CEÆ, or SALSOLA'CEÆ, a natural order of exogenous plants, consisting of herbaceous and half-shrubby plants, with leaves entire or divided, and destitute of stipules. The flowers are inconspicuous, hermaphrodite, or unisexual; the perianth deeply divided, persistent; the stamens inserted into its base, opposite to its segments, and equal to them in number, or fewer; the ovary single, free, or occasionally adhering to the tube of the perianth, with a single ovule attached to the base of the cavity; the style generally with 2–4 divisions. The fruit is membranous, enclosed in the perianth, which sometimes becomes fleshy. The seed has a curved or spiral embryo.—There are about 360 known species, most of which have a

Blitum Capitatum :  
a, whole plant, reduced ; b, a single flower ; c, the same, after flowering.

weed-like appearance, and grow in waste places. They are widely diffused over the world, but are particularly abundant in the northern parts of Europe and Asia. Beet and spinach are among the best known and most useful plants of the order. Many are occasionally used as pot-herbs, as some species of *Chenopodium* and of *orache*. The fruit of Strawberry Blite (*Blitum capitatum* and *B. virgatum*), a common weed in the south of Europe, has some resemblance in appearance to a strawberry, from the coherence of the fleshy perianths of a whole spike or head of flowers, and a sweetish, insipid taste. The seed of Quinoa (q. v.) is used for food as a kind of grain. Some of the C. are aromatic (see CHENOPODIUM). Some inhabit salt-marshes, and abound in soda, as the Saltworts (q. v.).

CHENOPO'DIUM, a genus of plants of the natural order *Chenopodiaceæ*, of which some of the native British species are well known by the name of Gooseroof, as weeds growing in gardens, on heaps of rubbish, and in waste places. The species are mostly annuals, with entire or toothed leaves, which, in some of them, have a sort of mealy hoariness. They are mostly natives of Europe, and of the temperate parts of Asia; but some are natives of America, into which, however, some of the common European species have found their way, and are naturalised as weeds. The genus has hermaphrodite

flowers, with perianth of five small green scales, five stamens, and solitary flat seeds. The leaves of many species are used as a substitute for spinach, particularly those of the GOOD HENRY, WILD SPINAGE, or ENGLISH MERCURY (*C. Bonus Henricus*), a perennial plant, native of Britain and other parts of Europe, often found growing by waysides, with stem more than a foot high, powdered with minute transparent globules, and large, alternate, triangular, arrow-shaped, entire leaves. It is cultivated in some places, particularly in Lincolnshire, chiefly for the leaves, but the young shoots are also used as asparagus. *C. intermedium*, *C. album*, &c., annuals, common in waste places, are also excellent substitutes for spinach. *C. olidum* or *vulvaria* (STINKING GOOSEROOF), an annual with an extremely nauseous odour, growing in waste places in Britain, &c., especially near the sea, is a popular medicine, in much repute as an antispasmodic and emmenagogue. *C. Botrys*, a native of the south of Europe, with pinnatifid leaves resembling those of the oak, and hence called JERUSALEM OAK, is in use as an expectorant and anthelmintic. It is not fetid like

Chenopodium Bonus Henricus :  
a, upper part of stem, with flowers, reduced ; b, c, d, separate flowers, with two, three, and four stamens.

the species last named, but agreeably fragrant. *C. Ambrosioides* has a strong aromatic odour, is used in Mexico instead of tea, and is much cultivated in France, an infusion of it being deemed useful in nervous disorders. *C. anthelminticum*, the WORM-SEED of the United States, has a strong and somewhat aromatic odour, and a high reputation as a vermifuge. Its seeds are chiefly used, or the essential oil extracted from them, called Oil of Worm-seed. More important than any of these species, as affording a principal article of food in the countries of which it is a native, is QUINOA (q. v.).

CHEPSTOW, a river-port in the south-east of Monmouthshire, on the right bank of the Wye, 2½ miles from its junction with the estuary of the Severn, and 14½ miles east-north-east of Newport. It lies between bold cliffs, on a slope rising from the river, in the midst of beautiful and grand scenery. There is a fine view from a rock called Windcliff, 970 feet high, three miles and a half up the river. The streets are broad. Here occurs the highest tide in Europe, rising suddenly, with a fierce current, often 50, and on rare occasions even 70 feet. Large vessels reach the town. One of the wells of the town ebbs and flows with the tide. Over

the Wye here is a railway bridge by Brunel, combining the principles of Telford's suspension and Stephenson's tubular bridges. C. has no important manufactures. It exports corn, cider, bark, iron, millstones, timber, and salmon. Pop. (1871) 3347. About 1000 vessels of 36,000 tons enter and clear the port annually.

**CHEQUE**, an order on a banker, or other party, for the payment of money. In all cases, the document must be on a penny-stamp, and it must not be for less than 20*s*. It is obligatory on the banker to honour the C. if he have funds belonging to the drawer. It must be presented within a reasonable time, otherwise the holder will have no recourse against the drawer should the banker fail. A C. is to be regarded as payment of a debt until dishonoured on presentation. It is not payable after the date of the drawer's death. The banker is liable for forgeries unless caused by carelessness in drawing.

**CROSS-CHEQUE**. An ordinary C. is payable to a certain party, or alternatively to 'bearer.' To prevent misappropriation when sent by post or otherwise, cross-cheques have been introduced. Two transverse lines are drawn across the cheque. If the words ' & Co.' or 'and Company' are written within the lines, payment can be obtained only through a banker. If the name of a particular bank be specified, as 'National Bank, Glasgow,' it must be presented at that bank only.

**CHER**, a tributary on the left side of the river Loire, rising near Crocq, in the department of Creuse; flows first north by Auzances, Eysaux, Montluçon, and St Amand; then north-west through the department of Cher by Vierzon; then westward by Salles, Montrichard, and Bléré, to the Loire, which it joins below Tours. Its whole length is about 200 miles; and it is navigable for the last 47 of its course.—**CHER**, the central department of France, to which the above river gives its name, is situated in lat. 46° 25'—47° 39' N., and in long. 1° 55'—3° 10' E. The surface is mostly level, traversed by well-wooded elevations, and produces corn, fruits, wine, hemp, flax, &c. The climate is mild and pleasant. Agriculture and pasturage of cattle are both capable of improvement. Area, upwards of 2800 square miles. Pop. (1872) 335,392. C. is divided into the three arrondissements—Bourges, St Amand, and Sancerre. Bourges is the chief town.

**CHERA'SCO**, a town of Piedmont, situated on the Tanaro, 30 miles south-east of Turin. It has manufactures of silk, and a pop. of about 10,000. A peace was concluded here between Louis XIII. of France and the Duke of Savoy in 1631. On April 26, 1796, the place was taken by the French; and here, three days after, the 'Armistice of Cherasco' was concluded between the Sardinian commissioners and Napoleon, by which the latter obtained the right of free passage for his troops through the Sardinian States; and the treaty that followed gave to the French republic Savoy, Nice, and the possessions of Piedmont to the westward of the Alps' highest ridge.

**CHERBOURG**, a fortified seaport town and arsenal of France in the department of Manche, is situated at the head of a deep bay on the northern extremity of the peninsula of Cotentin, on the English Channel, and opposite the west coast of the Isle of Wight, in lat. 49° 40' N., and long. 1° 35' W. Napoleon I. began to build the great defences of this northern stronghold of France. His nephew, Napoleon III., developed his plans, but not with the original view of an invasion of England. Occupying a prominent position on the French coast, only some 60 miles removed from the south shore

of England, the harbour-works have been extended, strengthened, fortified, and provisioned with cannon—the dock-yards improved, and facilities of embarkation afforded, to a degree that, as it is unparalleled in ancient or modern times, not unnaturally excites the lively apprehension of Englishmen. A description of the stupendous breakwater of C., enclosing a space of nearly 2000 acres, will be found in the article **BREAKWATER**. In connection with its fortifications, this breakwater assumes an importance that attaches to no other work of the kind in existence. At the apex of the angle formed by the meeting of the two branches of the breakwater or *digue*, there is a centre fort or battery, measuring 509 feet on the inner line of the parapet, which forms a flat semi-ellipse. The circular forts at the extremities of the breakwater are remarkably well placed for purposes of defence. Behind the centre battery there is to be an elliptical tower, measuring 225 feet on the major, and 123 feet on the minor axis. Altogether there are six large batteries on the mole. The entrances to the harbour are round the ends of the mole; and the passages are further defended by the fortifications of the *Île Pâle*, and by the batteries of La Roche Chavaignac and Fort Querqueville. A series of coast redoubts, and the two large fortifications of Les Roches des Flamands and du Homet, are situated behind this outer zone of defence. 'The arsenal,' says Mr W. H. Russell, who visited C. during the summer of 1860, 'is enclosed by a continuous line of bastion and curtain of a very elevated profile, defended by outworks, wet and dry ditches, and by profuse batteries of the heaviest guns, either in casement or en barbette. Wherever you look, you fancy that on the spot you occupy are specially pointed dozens of the dull black eyes from their rigid lids of stone.' Altogether, besides the batteries on the mole, C. is defended by 24 regular forts and redoubts. The town itself is commanded by La Roule (an exceedingly strong fort) and Fort d'Octeville on the heights behind. The military port of C. consists of an outer harbour of 776 feet in length by 663 feet wide, its minimum depth being 58 feet, and the entrance to which is 206 feet wide at its narrowest point. This harbour communicates by means of a lock with a floating basin, 957 feet long by 712 wide. The outer harbour has four building-slips for 120-gun ships, besides some smaller slips, and a fine graving-dock. In August 1858, an inner floating-harbour was inaugurated by the Emperor of the French, in presence of the Queen and many of the Lords and Commons of Great Britain. This harbour, entirely cut out of the solid rock, has a length of about 930 yards, and a breadth of 437 yards, and is surrounded by beautiful building-slips and capacious graving-docks. It is calculated that the roads of C. cannot, on account of the small depth of the greater portion, shelter more than 25 or 30 sail of the line, and about as many frigates, at one time. C. has a commercial port quite distinct from the other, situated on the south-east; but it displays little activity, the principal exports being eggs, butter, and cattle. The town itself is insignificant, the streets being narrow and dirty; and there are no public buildings of note. There are some manufactures of hosiery, chemicals, lace, and leather, and sugar and salt refineries; but the industrial energies of the great bulk of the population are absorbed in the arsenal and dock-yards. C. is a very ancient place; in the 10th c. it was known under the name of *Cerbury*. In 1758, C. was taken by the English, who destroyed the naval and military works, and levied a contribution on the town. Pop., exclusive of naval and military forces (1872) 48,000.

## CHERIBON—CHERRY.

**CHERIBON**, or **SHERIBON**, a seaport town of Java, situated on the north coast, 125 miles east-south-east of Batavia. It has a considerable trade in coffee, indigo, and teak-wood, and is the residence of a Dutch governor. Pop. 11,000.

**CHERIMOYER**, or **CHIRIMOYA** (*Anona Chirimolia*), the most esteemed fruit of Brazil and Peru, now common, and even naturalised in some parts of the East Indies, and other tropical countries of the Old World. It is a fruit of most delicious flavour, is sometimes described as the finest of all fruits, and sometimes as inferior only to the mangosteen. It belongs to the same genus with the Custard Apple (q. v.). Both flowers and fruit emit a pleasant fragrance, but when the tree is covered with blossom, the odour is so strong as to be almost overpowering. The fruit varies from the size of an orange to 16 lbs. or upwards in weight. It is roundish, or heart-shaped.

Cherimoyer:  
Branchlet with leaves, and section of fruit.

Externally, it is greenish, covered with small knobs and scales. The skin is rather thick and tough. Internally, the fruit is snow-white and juicy, and contains a number of small brown seeds. The edible part is soft like a custard, and forms almost the entire mass of the fruit. The C. attains its highest excellence only in particular soils and situations, and some varieties are much finer than others. No tropical fruit seems better to deserve a higher degree of attention than it has yet received in our hot-houses.

**CHERKA'SK.** See TCHERKASK.

**CHEERY** (*Cerasus*), a genus or sub-genus of plants, of which the best known yields one of our most esteemed stone-fruits. This is usually regarded as a sub-genus of *Prunus* (see PLUM), but is erected by some botanists into a distinct genus on very slender grounds, the most obvious distinction between the species of *Cerasus* and the true species of *Prunus* being that, in the former, the young leaves are conduplicate, or folded up, and in the latter they are convolute, or rolled together. Two species are pretty generally regarded as the parents of the garden cherries usually cultivated, *Prunus* or *Cerasus* *Avium*, and *P. cerasinus* or *C. vulgaris*—the former having the underside of the leaves hairy and a small

austere fruit; the latter having smooth shining leaves and a more juicy fruit. *C. Avium* attains a height of 40–50 feet. *C. vulgaris* is a smaller tree.

Common Cherry (*Cerasus dura'cina*):  
a, branchlet with leaves and fruit; b, flower.

Both have white flowers in clusters or nearly sessile umbels, and both are generally regarded as natives of Britain, and of the middle and south of Europe. In a wild state, they are usually called **GEAN** (*guigne*), and *C. Avium* is frequently planted—not only because it is exceedingly ornamental when in flower, but also as a timber-tree, being of rapid growth, with firm, strong, close-grained wood, suitable for the purposes of cabinet-makers, turners, and musical-instrument makers. But according to some botanists, there is only one species, of which these are varieties; and according to others, *C. vulgaris* is a native of Syria and other parts of Western Asia, and is only naturalised in Europe, having been first brought to Italy by Lucullus, after his victory over Mithridates (74 B.C.), from Kerasunt, on the coast of the Black Sea, from whence it derives its name. The cultivated varieties of the C. are very numerous, and differ very considerably in size, colour, and flavour. The fruit of the C. supplies the inhabitants of some parts of France with a principal article of food, especially the wood-cutters and charcoal-burners of the forests; and among their modes of preparing it is that of making it a principal ingredient in soups. It ripens in Norway and East Bothnia as far north as lat. 63°. In some parts of Germany, the public roads are lined for many miles together with avenues of C. trees. Besides its use for the dessert and for preserves, the C. is extensively used for making liqueurs. See KIRSCHWASSER and MARASCHINO. Varieties of C. with double flowers, and with pendulous branches, are frequently planted for ornament in shrubberies, and few trees or shrubs are more beautiful. The **ALL-SAINTS** C. produces flowers almost all summer, and even in autumn. Its fruit is small and rather acid.—The other species of C. are numerous. Some species are low, or even prostrate shrubs, as C. or *P. cerasifera*, the **GROUNDS** C. of the south of Europe and of Siberia; and C. or *P. pumila*, the **SAND** C. of North America.—The genus or sub-genus *Cerasus* contains also the different kinds of **BIRD** C. (q. v.) and **CHOKE** C. (q. v.), including the American **WILD** C., famous for its medicinal bark; the **MARALKS** (C. or *P. Mahaleb*) of the south of Europe, and the **CAPOLLIM** (C. or *P. capollima*) of Mexico and Peru—the first famous for the fragrance of its flowers, and

the second for the fragrance of its fruit; and the CHERRY-LAUREL (q. v.).

CHE'RRY-LAUREL, or LAUREL-CHERRY, a name given to those species of *Prunus* or *Cerasus* (see CHERRY) which have evergreen leaves. They are also often called LAUREL. They have small flowers in long racemes, and small fruit; the fruit of a nauseous taste; and most parts of the plant, but particularly the leaves and kernels, remarkably abounding in hydrocyanic (prussic) acid, and therefore very poisonous.—The COMMON C., sometimes called the BAY-LAUREL or LAUREL-BAY, very often spoken of simply as the LAUREL or COMMON LAUREL (*Prunus* or *Cerasus Lauro-cerasus*), is a shrub, sometimes of very large size, with ovato-lanceolate, convex, smooth, remotely serrated, shining, yellowish green leaves, and erect racemes of flowers. It is originally from Asia, but is now naturalised throughout the south of Europe, and is one of the most common ornamental shrubs in Britain, where it suffers only from such severe frosts as are of rare occurrence. It is propagated by seeds, layers, and cuttings. Its leaves resemble bitter almonds in smell and taste, and contain in great abundance the same essential oil (see ALMONDS, VOLATILE OIL OR), rich in hydrocyanic acid. From these leaves, by maceration in water for 24 hours, and subsequent distillation, is obtained the *Lauder-water* (q. v.), or *Cherry-laurel water*, sometimes employed in medicine as a substitute for hydrocyanic acid, and which formerly was so much used as a poison. The leaves are sometimes employed also for flavouring puddings, sauces, &c., and are safer for such purposes than oil of bitter almonds, but ought to be used with caution.—Another species, also very common as an ornamental shrub in Britain, but not quite so hardy as the common C., is the PORTUGAL LAUREL (*Prunus* or *Cerasus Lusitanica*), a native of Portugal, a large shrub—sometimes a tree—with dark-green leaves and lateral racemes. It does not grow so well under the shade of trees as the common cherry-laurel. From the dissimilarity of form and colour of their leaves, these species present a pleasant appearance when mixed, as they usually are, in the shrubbery.

CHERSO, an island of Illyria, belonging to Austria, in the Adriatic, 12 miles south-south-west of Fiume. A bridge unites it with the adjoining isle of Lossini. It has an area of about 105 square miles, with a population of some 14,000. Its surface is generally hilly and rugged, with forests in the north. The chief town is Cherso, at the head of a bay on the west side. Pop. 3500.

CHERSO'N. See KHERSON.

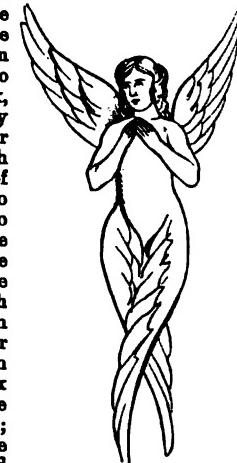

CHERSONE'SUS, the ancient name of several peninsulas and promontories in Europe, the most important of which are the Crimea (q. v.), C. Taurica; Gallipoli (q. v.), C. Thracia; and Jutland (q. v.), C. Cimbria.

CHERT, or HORNSTONE, a variety of quartz, always massive, and having a kind of granular appearance and structure. It is common in the Mountain Limestone, Oolite, and Green-sand formations; sometimes forms rocks; and often contains petrifications. It passes into common quartz and chalcedony, also into flint and flinty slate. Its colours are gray, white, red, yellow, green, or brown. The name C. is sometimes limited to the finer varieties, and the coarser are called Hornstone.—The name C. is very commonly given to the silicious concretions which occur as nodules and layers in limestone rocks, like flints in the chalk. When these materials exist to such an extent as to render the limestone useless for economical purposes, it is said to be 'cherty.'

CHE'RTESEY (Anglo-Saxon, Ceort's Eye or Island), a town in the county of Surrey, on a low strip of land between the right bank of the Thames, here crossed by a stone bridge, and the brook from Virginia Water, 20 miles west-south-west of London. It is irregularly built, chiefly consisting of two long cross-streets, and is surrounded by villas. The chief trade is in malt and flour. Many vegetables are raised for the London market. Pop. (1871) 3146. C. arose in a monastery founded in 666, and rebuilt in 964 by Edgar and the Benedictine monks. The South Saxon kings had a seat here during the heptarchy. Charles James Fox lived on St Anne's Hill, an abrupt elevation about a mile from the town. Cowley the poet resided in Chertsey.

CHE'RUB, in the plural *Cherubim* or *Cherub*, is the Hebrew name of a winged creature with a human countenance, which in the Scriptures is almost always represented in connection with Jehovah, and especially as drawing his chariot-throne. Cherubim are first mentioned in the Old Testament as guards of paradise; a C. with a flaming sword hindered the return of the expelled human pair. In the Holy of Holies in the tabernacle, and afterwards in the temple, cherubim wrought in embossed metal were represented above the mercy-seat, or covering of the Ark of the Covenant, so that they appeared to rise out of it. Figures of cherubim were also wrought into the hangings of the Holy of Holies. The cherubim that appear in the visions of Ezekiel and the revelations of John depart much from the early representations.

In Ezekiel they have the body of a man, whose head, besides a human countenance, has also that of a lion, an ox, and an eagle; they are provided with four wings, two of which support the chariot of Jehovah, and serve to fly, while the other two cover the body; the hands are under the wings, and the whole body is spangled with innumerable eyes. In the Revelation, four cherubim, covered with eyes, and having six wings, surround the throne of Jehovah; the first has the face of a lion, the second of an ox, the third of a man, and the fourth of an eagle. This gave rise at a very early period to the symbolical figures of the four evangelists, the human countenance being associated with Matthew, that of the lion with Mark, of the ox with Luke, and of the eagle with John. Most Jewish writers and Christian Fathers conceived the cherubim as angels; and Dionysius the Areopagite, in his *Celestial Hierarchy*, makes them a separate class in the first hierarchy. Most theologians also considered them as angels, until Michaelis shewed them to be a poetical creation; and Herder, in his *Spirit of Hebrew Poetry*, compared them to the griffins that watch treasures and other fabulous figures. In Christian art, they are generally represented as sexless figures, with wings from the shoulders, the legs also being either covered by wings, or having wings substituted for them. Very often they have also a glory round the head.

Cherub.

CHERUBINI—CHESHIRE.

**CHERUBINI, MARIA LUIGI CARLO ZENOBI SALVADOR**, one of the best Italian composers, was born September 8, 1760, at Florence, and died March 15, 1842, in Paris, where he was director of the Conservatoire. In his thirteenth year, by his early compositions—a mass and an intermezzo—he attracted the attention of Sarti, who received him as a pupil. In the interval from 1780 to 1788, he composed eleven Italian operas, including *Ifigenia in Aulide*, the most successful of the series. In 1784 he visited London. After 1786, C. resided chiefly in Paris, whence his fame rapidly extended over Europe. Besides the *Ifigenia*, his chief pieces are *Demophon* (1788), *Lodoiska* (1791), *Elisa* (1794), *Mède* (1797), the *Portuguese Inn* (1798), *Les Deux Journées*, and *Anacreon*. C. also composed church music, chamber music, &c., with singular beauty and success. It is worthy of remark that the richness of his instrumental music, which was once made a ground of objection, now appears moderate as contrasted with the monstrous prodigalities of the modern orchestra. See *Piechianti, Notizie sulla Vita e sulle Opere di Cherubini* (Milan, 1843).

**CHERU'SCI**, a German tribe first mentioned by Caesar. They dwelt north of the Silva Bacensis, or Harz Forest, but the exact boundaries of their territory cannot be ascertained. They are chiefly memorable in connection with their great leader Arminius, or Hermann, who, having formed an alliance with other German tribes, attacked and annihilated the Roman legions under Varus, in the forest of Teutoburg, 9 A.D. After the death of Arminius, internal strife broke out among the C., and Tacitus says that they were subjugated by the Chatti, a neighbouring tribe. Notwithstanding this they again appear as the chief tribe in the military league of the Saxons about the end of the 3d century. In the beginning of the 4th c., they are included among the peoples who had leagued against Constantine, and towards the close of the same are still mentioned distinctively by Claudio.

**CHE'R'VIL** (*Anthriscus Cerefolium*), an umbelliferous plant, which has been long cultivated as a pot-herb, and used in soups and for a garnish, &c., in the same manner as parsley. It is much more used in some parts of the continent of Europe than in Britain. It is a native of Europe, naturalised in some parts of England. The leaves have a peculiar, somewhat sweetish, pleasantly aromatic smell and taste, by which the plant may be known from its congener *Anthriscus vulgaris* or *Scandix Anthriscus*, a poisonous weed, whose leaves have a disagreeable smell, and which is also distinguished by its hispid fruit. There is a variety of C. with large roots, for the sake of which it is cultivated.—The umbelliferous plant called *Venus' Combs* or *SHEPHERD'S NEEDLE* (*Scandix pecten* or *S. Pecten Veneris*), a native of Britain and of the continent of Europe, often found in cornfields, and remarkable for the appearance and large size of its fruit, and another species (*S. australis*) which grows in the south of Europe, have a taste and smell resembling C., and are used in the same way on the continent. SWARZ C. or SWEET CICELY (*Myrrhis odorata*; *Scandix odorata* of the older botanists), a native of the south of Europe and of some parts of Asia, common in the neighbourhood of houses in Britain, although probably not a true native, is frequently cultivated in Germany under the name of *Spanish C.* or *Anise Chervil*. In Scotland, the plant is commonly called *Myrrh* by the peasantry. Its smell is peculiarly attractive to bees; and the insides of empty hives are sometimes rubbed with its leaves, to induce swarms to enter.—The species of *Cherophyllum*, coarse weeds, are also called chervil.

**CHE'SAPEAKE BAY**, the largest inlet on the Atlantic coast of the United States, being 200 miles long, and from 4 to 40 broad. Its entrance, 12 miles wide, has, on the north, Cape Charles, in lat. 37° 3' N., and long. 76° 2' W.; and on the south, Cape Henry, in lat. 36° 56' N., and long. 76° 4' W., both promontories being in Virginia. C. B. has numerous arms, which receive many navigable rivers, such as the Susquehanna and the Patapsco on the north, through Maryland; the James on the south-west, from Virginia; and the Potomac on the west, between these two states. Unlike the shallow sounds towards the south (see CAROLINA), this network of gulfs and estuaries, to say nothing of its noble feeders, affords depth of water for ships of any burden, virtually carrying the ocean up to the wharves of Baltimore and the arsenals of Washington.

**CHE'SELDEN, WILLIAM**, an English surgeon and anatominist, was born in 1688, at Barrow-on-the Hill, in Leicestershire. He commenced his medical studies at fifteen, at twenty-three established himself as a lecturer on anatomy, and in the following year was elected a fellow of the Royal Society. He was afterwards appointed surgeon to St Thomas's, St George's, and Westminster hospitals, where he acquired great reputation as an operator. In this respect, few surgeons, if any, ever surpassed him. He died at Bath, 11th April 1752. C.'s principal works are—the *Anatomy of the Human Body* (1713), long a text-book on the subject in England; a *Treatise on the Operation for the Stone* (1723); and *Osteology, or Anatomy of the Bones* (1733). He also contributed several valuable papers to the Philosophical Transactions of the Royal Society.

**CHE'SHIRE** a maritime county in the west of England, bounded north by the river Mersey, and partly also by the Irish Sea, in lat. 52° 56'-53° 54' N., long. 1° 47'-3° 11' W. Its greatest length from north-east to south-west is 58 miles; greatest breadth, 32; area, 1052 square miles, of which only  $\frac{1}{4}$  is uncultivated; circuit, 200 miles, of which 8 are coast. The surface forms an extensive nearly level plain between the Derbyshire and Welsh mountains, well wooded, and studded with small lakes or meres, and chiefly occupied by grazing and dairy tracts, which are among the most important in England. This plain, comprising four-fifths of the surface, rests on new red sandstone, and is crossed, near the middle, by a tract of high ground running south-west from a promontory overlooking the Mersey, near the mouth of the Weaver, to Beeston Castle rock, 366 feet high. On the east border of the county is a line of new red sandstone hills. In the north-east is part of the Lancashire coal-field. In the east, are large tracts of peat, and much of the county is wet and marshy. The north-west part of C. forms a hammer-headed peninsula called Wirral, about 8 miles broad, between the estuaries of the Dee and Mersey. Coal measures appear on the west side of this peninsula, as well as on the west border of the main part of the county. The chief rivers are the Dee, Mersey, and Weaver, which are navigable. The Dee skirts the county on the west 55 miles, and the Mersey on the north for 40 miles. The Weaver rises in the east part of the county, and runs 40 miles west-north-west into the Mersey. The county contains an almost unrivalled system of canals, including the celebrated Bridgewater Canal, and is traversed by the main line of the London and Liverpool Railway, and the Crewe, Chester, and Holyhead Railway. The chief mineral products are rock-salt and coal. The rock-salt, discovered in 1670, and mined by gunpowder, is found near the Weaver and its branches, especially

near Northwich, at the depth of 28 to 48 yards, in two beds, the upper one being 15 to 25 yards, and the lower one above 40 yards thick, under a stratum of hard rock, 25 to 35 yards thick. The mines, one occupying 35 acres, when lighted up, resemble a fairy palace sparkling with gems and crystal. Much salt is also made from brine-springs 20 to 40 yards deep. Coal is worked in the north-east part of the county. There are also lead (with cobalt) and copper-mines, and in almost every part of the county freestone, limestone, millstone, and marl are found. The climate is moist. The soil is mostly a clayey or sandy loam, with marl and peat, and very fertile. The soil and climate are well fitted for pasturing, dairy-farming, and cheese-making, which are the chief agricultural occupations. About 150,000 cows are kept in C., and the quantity of cheese annually produced is estimated at from 15,000 to 30,000 tons—the best being made on the strongest lands. The hedgerows abound in oaks. C. is a manufacturing as well as an agricultural county. Pop. in 1871, 561,131. The chief towns are Chester (the county-town), Macclesfield, Stockport, Congleton, Knutsford, and Birkenhead. The county of C. returns 6 members to parliament. C. has some Roman roads, tumuli, barrows, remains of religious houses, and many old castles and halls. The 12th Roman legion occupied Chester till the 3d century. Egbert, in 828, added C. to the Anglo-Saxon kingdom of Mercia. William the Conqueror erected C. into a county palatine, under Hugh Lupus, with an independent parliament and 8 barons. Henry VIII. subordinated it to the English crown; but C. did not send representatives to the English parliament till 1549, and the separate jurisdiction ceased entirely only in 1831.

**CHESTNUT**, or **CHESTNUT** (*Castanea*), a genus of plants of the natural order *Ocupuliferae*, closely allied to the Beech (*Fagus*), and distinguished from it by long male catkins, longitudinally set with groups of flowers, a 5–8-celled ovary, and compressed rounded nuts. The name is derived from the town

and is used in house-building, for making furniture, and for many other purposes. The timber of the C. so much resembles that of the oak, as in old buildings to be distinguished with difficulty. The bark is used for tanning, but is worth only about half the price of oak-bark. Young C. trees are much esteemed for hop and espalier poles. The C. is therefore frequently grown in England as coppice-wood; but it succeeds well as a timber-tree even in Scotland, although it does not generally ripen its fruit. In Devonshire, however, and in some other parts of England, it is planted to a considerable extent as a fruit-tree. It succeeds throughout all the middle latitudes of Germany, but dislikes a damp foggy atmosphere. It prefers a dry light soil, and succeeds only where there is a dry subsoil. The nuts are generally two in each husk. They form a principal part of the food of the poor in the south of Europe, being used either roasted or boiled, and often ground into flour, and made into a kind of bread. They contain 16 per cent of sugar, and by pressure yield a sugary juice, which readily undergoes the vinous fermentation, and from which a crumb-like kind of sugar may be obtained. The best kinds of chestnuts are called by the French *Marrona*. When cultivated as a fruit-tree, the C. is generally grafted, by which means the better varieties are secured. Other species of C. also bear eatable fruits: those of the AMERICAN C. (*C. Americana*), a tree much resembling the common C., and of the DWARF C. or CHINQUAPIN (*C. pumila*), a low tree, or more generally a shrub of 7–8 feet high, are used in America. The fruit of the Dwarf C. is of the size of a common hazel-nut; the nut is convex on both sides. The plant reaches its southern limit on the banks of the Delaware.—A number of species are natives of the East. The inhabitants of the mountains of Java eat the fruit of the SILVERY C. (*C. argentea*), and the TUNGURUT (*C. Tessneri*), boiled or roasted, like the common chestnut. Both of these are large trees, the Tungurut reaching a height of 150 feet.—The HORAS C. (q. v.) is entirely different from the true chestnut.

**CHESS** (Fr. *échec*, Ger. *schach*). The origin of this, the most purely intellectual of all games of skill, has been much disputed; thus much may now be considered as certain, that, under the Sanscrit name of *Chaturanga*, a game, essentially the same as modern C., was played in Hindustan nearly 5000 years ago. In its gradual diffusion through the world in succeeding ages, the game has undergone many alterations and modifications, both in nature and in name; but marked traces of its early Asiatic origin and descent are still discerned by the learned in its nomenclature and other characteristics. From Hindustan, C. spread into Persia, and thence into Arabia. The Arabs, it would appear, in the 8th c., introduced the game into Spain and the rest of Western Europe; and in England, chess-play seems to have been known prior to the Norman Conquest. Into Constantinople, and probably some other cities of Eastern Europe, the game may have been imported from Persia at a period earlier than its Moorish conveyance into Spain.

The original Hindu game was played on a board of sixty-four squares, as now, but by four persons, two being allied against two, as in whist. Hence the name *Chaturanga*, from *chatur*, 'four,' and *anga*, 'a member' or 'component part.' The name *Shatranj*, used by the Persians and Arabs, is a corruption of the Sanscrit. The English, French, and other European names are derived from the Persian term *shah*, 'king.' *Check*, the warning when the king is in danger, is but another form of *shah*; in fact, 'king' is sometimes used for 'check,' and in German

Branchlet, Leaves and Catkins of Sweet Chestnut.

of *Castanum*, near Magnesia, in Asia Minor. The COMMON C., SPANISH C., or SWEET C. (*C. vulgaris*), is said to have been first brought from Asia Minor to Sardinia, and from thence to have gradually extended over the south of Europe, where it has long been naturalised, and forms extensive woods. It is an ornamental, stately, or, in exposed situations, a very spreading tree, of great size and longevity; the still surviving C. of Totworth in England was known as a boundary-mark in the reign of King John. A celebrated C. tree on Mount Etna measured 204 feet in circumference of trunk. The C. has oblongo-lanceolate, acuminate, serrated, smooth leaves. The timber is durable and hard,

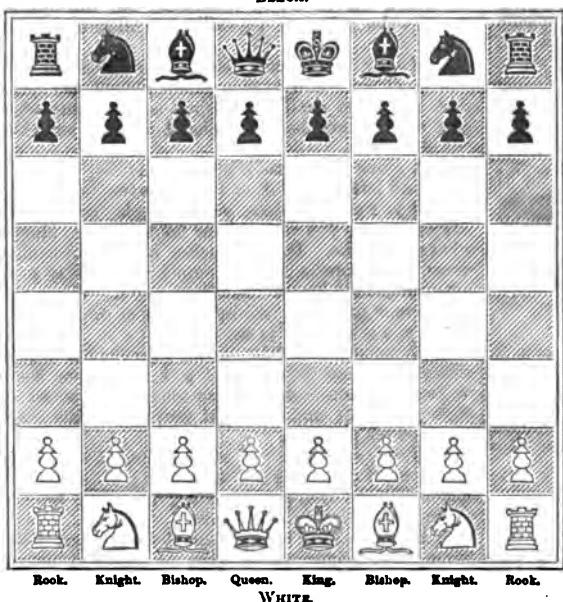

CHESS.

*schach* is both the name of the game and the term of warning. The term *rook* is from the Sans. *roka*, Pers. *rukh*, meaning a ship or chariot; *pawn* is said to be from *peon*, an attendant, or foot-soldier.

The books written upon C. 'would form a tolerably large library.' Of works on the antiquities of the subject, we may mention Dr D. Forbes's *History of Chess* (Lond. 1860). The best modern practical works on the art of chess-play are the *Chester-player's Hand-book*, and *C. Pruzia*, by Staunton; Morphy's *Games at C.*, edited by Lowenthal; Jaenisch's *Treatise on the Openings*, translated by Walker; and Horwitz and Kling's *Collection of Kind-games*. The subject is also pretty fully treated in Chambers's *Information for the People*, 'In-door Amusements.'

The game of C. is played upon a square board marked out into sixty-four square divisions, which are coloured alternately black and white, in order the more clearly to determine and denote the respective movements of the several pieces. In placing the board for play, each player must always have a *white* corner square at his right hand. There are two sets of pieces, of opposite colours, of sixteen men each, and of various powers according to their rank. These sets of men are arrayed opposite to each other, and attack, defend, and capture, like hostile armies. The accompanying diagram will best explain the name, form, and place of each man at the commencement of the game :

BLACK.

The superior officers occupying the first row on each side are called *pieces*; the inferior men, all alike, standing on the row immediately in front of the pieces, are called *pawns*. Their moves and powers, along with the peculiar terms used in C., may be briefly described as follows :

A *Pawn*, at his *first move*, may advance either one or two squares, straightforward; but after having once moved, he can only advance a single square at a time. In capturing,\* an adverse piece, however,

\* Taking is always performed by lifting the captured man from the board, and placing the captor on his square. The pawn is the only man whose mode of taking differs from his ordinary move.

a pawn moves one square diagonally either right or left; but the pawn never moves backward. On arriving at an 8th square, or the extreme line of the board, a pawn may be exchanged for any piece his owner chooses to call for, except a king; so that a player may have several queens on the board at once. If, on moving two squares, a pawn pass by an adverse pawn which has arrived at the 6th line, the advanced adverse pawn may take the other in *passing* in exactly the same manner as if the latter had moved but one square.

A *Bishop* moves any number of squares diagonally, but diagonally only; therefore a bishop can never change the colour of his square.

A *Knight* moves two squares, so as always to change colour—that is, he moves one square forward or backward, and one diagonally. On account of this crooked movement, he can leap over or between any surrounding pieces; and therefore a knight's check—unless he can be taken—always compels the king to move.

The *Rook*, or *Castle*, moves any number of squares forward, backward, or sidewise, but not diagonally.

The *Queen* is by far the most powerful of the pieces, and moves over any number of squares, either in straight lines or diagonals, forward, backward, or sidewise; so that her action is a union of that of the rook and bishop. At starting, the queen always stands on a square of her own colour.

The *King* is the most important piece on the board, as the game depends upon his safety. He moves only one square at once, in any direction, except when he *castles*—a term to be explained presently. The king cannot be taken; but when any other piece attacks him, he is said to be in *check*, and must either move out of check or interpose some one of his subjects, unless the checking piece can be captured. When there is no means of rescuing the king from check, he is said to be *checkmated*, and the game is over. Of course, the two kings can never meet, as they would be in check to each other. *Double-check* is when a piece, by being moved, not only gives check itself, but also discovers a previously masked attack from another.

*Castling* is a privilege allowed to the king once in a game. The move is performed either with the king's rook or queen's rook—in the former case, the king is moved to the king's knight's square, and the king's rook is placed on the king's bishop's square: in the latter case, the king is moved to the queen's bishop's square, and the queen's rook is moved to the queen's square. But the king cannot castle after having once moved, nor at a moment when he is actually in check, nor with a rook that has moved, nor when he passes over a square attacked

or checked by an adverse piece, nor when any piece stands between him and the rook with which he would castle, nor when in the act of castling either the king or rook would have to capture an adverse piece.

A *drawn* game results from neither player being able to checkmate the other: thus, a king left alone on each side must of course produce a draw, as do also a king with a bishop, or a knight, against a king.

*Stalemate*, or the not being able to move either the king or any other piece, also constitutes a drawn game.

*Odds* is a term applied to the advantage which a

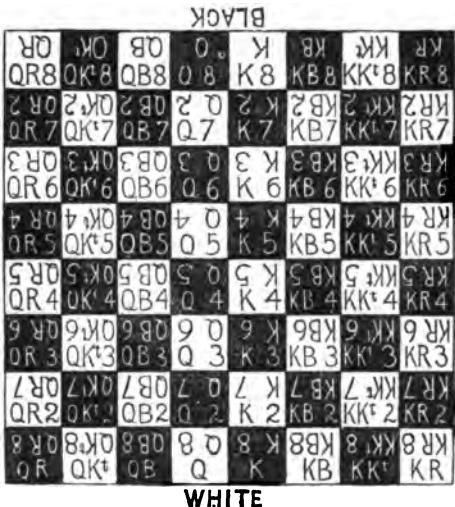

forces may be fair odds ; or if the players are more nearly matched, the one may give a pawn. When the odds of a pawn are given, it is always understood to be the king's bishop's pawn.

*Gambit* is a technical word implying the sacrifice of a pawn early in the game, for the purpose of taking up an attacking position with the pieces.

Supposing the worth of a pawn to be represented by unity, the following is a tolerable average estimate of the comparative value of the pieces : Pawn 1, bishop 3, knight 3, king 4, rook 5, queen 9.

The chess-men being placed, the players begin the engagement by moving alternately ; each aiming to gain a numerical superiority by capturing his opponent's men, as well as such advantages of position as may conduce to victory.

The rows of squares running straight up and down the board are called *files*, those running from side to side are called *lines*, and those running obliquely across are termed *diagonals*.

The accompanying diagram will shew at once to the learner how each square is named ; and by its aid he will speedily be enabled either to play over printed games, or to record his own. The playing over the following short game will serve him as a little initiatory practice.

#### WHITE.

1. King's Pawn two.
2. King's Bishop to Queen's Bishop's 4th.
3. Queen to King's Rook's 5th.
4. Queen takes King's Bishop's Pawn, giving Black checkmate.

#### BLACK.

1. King's Pawn two.
2. King's Bishop to Q Bp's 4th.
3. King's Knight to K Bp's 3d.

The foregoing brief mode of giving a checkmate is called the *Scholar's mate*, and is often practised upon young and unwary players. Any contractions used, such as 'K' for king, 'B' for bishop, &c., will readily be understood by the use of the diagrams.

In the conduct of the game, and in the practice of C., the following rules, precepts, and hints will be found very generally useful :

Play forth your minor pieces early, and castle your king in good time. You may sometimes delay castling with advantage, but not often.

Do not expect to be able to establish an enduring attack with half your forces at home.

Seek to let your style of play be attacking ; and

800

game.

Never touch a piece without moving it, nor suffer yourself or your opponent to infringe any other of the laws of the game.

You will find, when first player, that the opening springing from your playing 1st King's pawn two, and then your King's Knight to the Bishop's 3d, is one of the best that you can adopt ; but do not adhere to any one opening only.

If you wish to adopt a purely defensive opening, you may play 1st King's pawn one, and follow up with Q P 2, and Q B P 2.

Next to playing with good players, nothing will conduce to improvement more than looking on at two expert players whilst they play. Wanting these advantages, it is best to play over openings, and actual games, from books or journals.

To prevent blunders and oversights, always endeavour to perceive the motive of your adversary's move before you play ; and look often round the board to see that you are not losing sight of any better move than the one you intended, or that you are not suffering yourself to be tempted by a bait.

When an onlooker, never interfere.

Always endeavour to lose with good temper, and to bear your adversary's faults with a good grace.

#### The Laws of Chess.

The laws of C. are at present in a somewhat unsettled, unsatisfactory condition ; but the following are the principal prevailing regulations of the game :

1. If any error have been committed in the placing of the board or men, either player may claim that the game shall be finished as it stands, after four moves have been completed on each side, but not else.

2. A move once made, by your having moved a piece and left hold of it, cannot be retracted.

3. If you touch a piece, you must play that piece ; but as long as you retain your hold, you can play it where you like. If you touch a piece that cannot move, your opponent may compel you to play your king, unless the king be unable to move. When you touch your pieces for the mere purpose of adjusting them, you are bound to say so.

4. If you make a false move, your opponent may either cause you to retract it and move your king, or he may claim that the false move shall stand, or that you shall make a legal move with the same piece, at his pleasure.

5. If you touch one of your opponent's men, he may compel you to take that man ; or if that be impossible, to move your king, provided he can move without going into check.

6. If on the king being checked, due notice is not given, the player whose king is attacked is not bound to notice it.

7. In every fresh game, except when one is drawn, the first move alternates.

8. Drawn games counting as no games at all, the player who had the first move in a drawn game is also entitled to it in the next. (This absurd regulation is fast becoming obsolete ; and it is now a common agreement in playing a series of games, that the move shall invariably alternate.)

9. A player who gives the odds of a piece, is entitled to the first move.

10. The time for consideration of a move is not limited ; but a player leaving a game unfinished without his opponent's permission, loses such game.

11. When at the end of a game one player is left with just sufficient superiority of force to win—such as a king and rook against king, king and two

bishops, or king, knight, and bishop against king—he who has the greater force must give checkmate within fifty moves on each side, or else the game is adjudged to be drawn. This law is framed to prevent unskillful players from wearying their opponents by persisting in the attempt to accomplish what they are too untutored to effect; and it is perfectly just, since the allotted number of moves is amply large enough and to spare.

12. In case of any dispute about the laws, both players are to agree as to an umpire, whose decision is to be considered final.

As there is no branch of chess-study better calculated to advance the skill of a learner than the attentively playing over recorded games between first-rate players, we have given an example of a game played blindfold, simultaneously with five other games, by the celebrated American chess-player, Paul Morphy. This gentleman visited England and the continent of Europe in 1858, and in his contests with the best players fairly carried all before him, so that he now ranks as the greatest chess-player living.

are occasionally made to the fund by individuals. Disabled sailors receive a present sum of money, if not deprived of the power of earning a living; but if their injuries are more permanent, they receive a pension from the C., for one year, or for several years, or for life, paid half-yearly.

CHEST, or THORAX, in Anatomy, is the part of the body which lies beneath the neck and above the Abdomen (q. v.), constituting the uppermost of the two divisions of the trunk, or that which contains the heart and lungs, and is bounded externally by the ribs. The C. is somewhat conical in form, the broad or lower end of the cone being shut in by the diaphragm, a large muscular partition which projects upwards from the lower ribs, being convex towards the C., and concave towards the abdomen. In Respiration (q. v.), the diaphragm descends by its own muscular contraction, while at the same time the ribs are drawn upwards and outwards by the intercostal muscles. The cavity of the C. is thus enlarged, the lungs are expanded, and air is drawn into them through the trachea or windpipe and bronchi. See LUNGS. The combination of bone, cartilage, muscle, and tendon entering into the composition of the C. is such as to permit of expansion-movement to the extent required, and yet to guard against over-expansion, which would be fatal to the delicate textures within. The bones of the C. are at the same time a powerful protection against external injury.

The structures forming the walls of the C. are:

1. The backbone or spinal column, AA, divided into 24 vertebrae, 12 of which, called the dorsal

Chest.

CHEST, MILITARY, is a technical name for the money and negotiable securities carried with an army, and intended to defray the current expenses. In the English military system, this department is managed by the commissariat.

CHEST, NAVAL. The name of C. has been given to certain funds, maintained for the benefit of seamen belonging to the royal navy. A fund, called the *Chest at Chatham*, was suggested so long ago as the days of Drake and Hawkins, for the relief of wounded and superannuated seamen. In 1590, all seafaring men in Queen Elizabeth's service consented to a stoppage out of their pay of 2d. to 6d. per month, to support this fund. The money was not in those days, as it would be now, put out to interest; it was kept in a C., and hence the name given to the fund itself. During the 18th c., the system became organised in a better manner; but still the fund retained the name of C.; insomuch that when the office was removed from Chatham to Greenwich, in 1803, it became the *Chest at Greenwich*. The C. is managed *ex officio*, and the accounts are annually laid before parliament. Handsome gifts

vertebrae, form the thoracic portion. 2. Twelve ribs, B, B, B, attached to the transverse processes or projecting portions of the dorsal vertebrae, and ending in front in the costal cartilages, by which the ribs are connected with 3. The sternum or breastbone, C, which occupies the middle line. 4. The Diaphragm (q. v.). See also SKELETON.

The contents of the C. are the heart, the great arteries and veins, the lungs, the trachea or windpipe, the bronchi or branches of the trachea, leading to the lungs, the oesophagus or gullet, and the Thoracic Duct (q. v.), or general terminus

of the lymphatic system of vessels, by which the chyle and lymph are discharged into the blood. The very great importance of these parts to life, and their great liability to deranged action, renders the C. the seat of a large proportion of the diseases which afflict humanity, and especially of those which end in death. Indeed, of the three organs which the great physiologist, Bichat, called the 'tripod of life'—viz., the brain, heart, and lungs—the C. contains two; hence its condition in almost all diseases, and especially in fatal diseases, is an object of the utmost solicitude to the physician.

The diseases of the C. depend in some cases on alterations in its form, as by Rickets (q. v.) and other diseases affecting the bones in early childhood or in youth, as by too tight lacing in girls. The lungs and air-tubes are subject to a great variety of diseases, among which the principal are consumption or phthisis pulmonalis, pneumonia, pleurisy, bronchitis or pulmonary catarrh. The heart is subject to pericarditis, endocarditis, and chronic organic disease of the valves, as well as to enlargement (hypertrophy), dilatation, and degenerations of its muscular texture. The aorta, or great artery, is often affected with degeneration of its walls, and occasionally with aneurism. The great veins are liable to over-distension, and to obstruction by tumours or by coagulation of the contained blood. The thoracic duct is also sometimes obstructed by external pressure; and the oesophagus has a number of diseases usually described in connection with the alimentary canal. Most of the diseases here referred to are described either under special articles, or under LUNGS and HEART.

The examination of the C. by physicians is now conducted not only by an investigation of the symptoms or obvious characters of the disease, but by a minute and elaborate examination into the physical condition of the contained organs by means of Auscultation (q. v.), Percussion (q. v.), Measurement, &c. The application of these methods is too complicated and technical for explanation in detail, but their results will be shortly alluded to incidentally in the articles above referred to on the diseases of the chest. The name of Laennec (q. v.) will be long remembered in medicine as that of a great original observer, who has contributed more than any other to the progress of knowledge in this department.

CHESTER, an ancient and episcopal city, municipal and parliamentary borough, and river-port, the capital of Cheshire, on the right bank of the Dee, 22 miles from the mouth of its estuary, 16 miles south-east of Liverpool. It stands on a rocky sandstone height, and is mostly enclosed in an oblong quadrangle of ancient walls, 7 or 8 feet thick, nearly 2 miles in circuit, and with 4 gates, and now forming a promenade with parapets, where two persons can walk abreast. The two main streets cross each other at right angles, and were cut out of the rock by the Romans 4 to 10 feet below the level of the houses. The houses in these streets are curiously arranged: the front parts of their second stories, as far back as 16 feet, form a continuous paved promenade or covered gallery, open in front where there are pillars and steps up from the street below, with private houses above, inferior shops and warehouses below, and the chief shops of the town within. This arrangement, called the 'rows,' together with the ancient walls, and the half-timbered construction of many of the houses, with quaintly carved ornamented gables of the 16th c., render C. perhaps the most picturesque city in England. C. cathedral is an irregular massive structure of

crumbling sandstone, 375 by 200 feet, with a tower of 127 feet. It was formerly the church of the abbey of St Werburgh, and for 650 years was one of the richest in England. St John's Church, now partially in ruins, is supposed to have been founded by Ethelred in 698. The Dee is crossed by a superb stone arch of 200 feet span. Suburbs of villas have recently arisen outside the walls; and a public park, presented by the Marquis of Westminster, was opened in 1867. The C. railway station is the centre of several important railways, and is one of the largest and finest in the kingdom. C. has manufactures of lead, iron-foundries, chemical works, and an iron-ship-building yard. The chief exports are cheese, copper, cast-iron, and coal. C. has many charitable and religious institutions, and is the abode of many wealthy families. Pop. 35,257.

The city is a county in itself, and returns two members to parliament. In 1869, 2885 vessels, of 166,127 tons, entered and cleared, but the silting up of the mouth of the Dee is against the shipping trade.

C. was *Devana Castra*, or *Colonia Devana*, an important Roman station, and has yielded many Roman remains—as masonry, coins, inscriptions, fibulae, altars, a hypocaust, and a statue of Pallas. C. was only in 828 taken by the Saxons from the Britons. Its strength made it a refuge against the descents of the Danes and Northmen, but the Danes took it in 894. Ethelfrida retook it in 904, and rebuilt the walls. From the Norman Conquest to the time of Henry III., the Earls of Chester had their own courts and parliaments at C., with 8 subfeudatories and the superiors of the great religious houses, Cheshire being then a county palatine. Henry III. made his eldest son Earl of Chester, a title held since by the Prince of Wales. Llewelyn ravaged C. in 1255. The 25 famous C. mysteries or religious plays by Randle a monk (1250—1260), were acted in the church. After a long siege, the parliamentary forces defeated those of Charles I. at C., and took the city. Pearson and Porteus were bishops of Chester. Trinity Church contains the remains of Matthew Henry, the biblical commentator. The commerce of C. has steadily declined since the rise of Liverpool.

CHESTERFIELD, a municipal borough in Derbyshire, near the Hipper and Rother rivulets, 24 miles north-north-east of Derby by rail. There are manufactures of leather, silk, lace, earthenware, and machinery; and there are several blasting-furnaces in the neighbourhood. The manufactures are increasing rapidly, and the minerals in the neighbourhood, including coal, iron, potters' and brick clay, slates, and lead, are being greatly developed. The population was, in 1851, 7100; in 1871, 11,427. Trade is facilitated by a canal connecting C. with the Trent, and by the main line of the Midland Railway.

CHESTERFIELD, EARL OF (PHILIP DORMER STANHOPE), an English statesman and author, eldest son of the third Earl of Chesterfield, was born in London, September 22, 1694, and studied at Cambridge. In 1714, he made the tour of Europe, and the following year was appointed a gentleman of the bedchamber to the Prince of Wales. About the same time, he was elected M.P. for St Germans, in Cornwall. In 1726, on his father's death, he became Earl of C., and in 1727 was sworn a privy councillor. In 1728, he was appointed ambassador extraordinary to Holland, and in 1730 was made a knight of the Garter and Lord Steward of the Household, but soon resigned that office. An eloquent and frequent speaker, he took an active part in all the important business in the House of Lords, and was for several

years the strenuous opponent of Sir Robert Walpole, then premier. In 1744, he connected himself with the administration, and in 1745 was re-appointed ambassador to the Hague, but was soon nominated Lord-lieutenant of Ireland, where he rendered himself exceedingly popular. In October 1746, he became one of the principal secretaries of state, but, two years after, declining health caused him to resign office, and in 1752 he was seized with deafness. Distinguished by brilliancy of wit, polished grace of manners, and elegance of conversation, he lived in intimacy with Pope, Swift, Bolingbroke, and other eminent men of the day. Dr Johnson, whose Dictionary, on its appearance, he affected to recommend, called him 'a wit among lords, and a lord among wits.' He wrote several papers, on temporary subjects, in *The Craftsman*, *The World*, periodicals of the time; but he is now best known by his *Letters to his Son*, Philip Dormer, written for the improvement of his manners. These letters have been often republished, and they afford a good idea of the mental and moral calibre of the author. Lord C. died March 24, 1773.

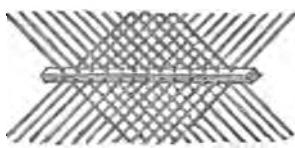

CHESTERFIELD INLET, a long and narrow gulf, penetrating to the westward from the north-west of Hudson's Bay. Its extreme dimensions are 250 and 25 miles; and the lat. and long. of its mouth are 63° 30' N., and 90° 40' W. C. L. is studded nearly throughout with islands.

CHEVALIER (Fr. *cheval*, a horse), in Heraldry, a horseman armed at all points. In its more general acceptation it signifies a Knight (q.v.). See also BANNERET and CHIVALRY.

CHEVALIER, MICHEL, an eminent French economist, born at Limoges, January 13, 1806, was, at the age of 18, admitted a pupil of the Polytechnic School. Thence he went to the School of Mines, and some days before the revolution of July, he was attached as an engineer to the department du Nord. Led away by the theories of the St Simonians, he was for two years editor of the *Globe*, the organ of that sect. Joining the schism of M. Enfantin, he took an active part in the compilation of the *Livre Nouveau*, the standard of their doctrines, and in 1832 suffered six months' imprisonment, on account of his free speculations in regard to religious and social questions, being regarded as an outrage on public morals. On his liberation, he at once retracted all that he had written in the *Globe* contrary to Christianity, and against marriage, and obtained from M. Thiers a special mission to the United States, to inquire into the systems of water and railway communication there. The results were published in his *Letters from North America* (1836, 2 vols. 8vo). After a visit to England, he issued a work, entitled *Material Interests in France: Public Works, Roads, Canals, Railways* (1838, 8vo). He was named, successively, Chevalier of the Legion of Honour, Councillor of State (1838), a member of the Superior Council of Commerce, and of the Royal Council of the University; and, in 1840, Professor of Political Economy in the College of France. In 1840, he was re-established in the Corps of Mines as engineer of the first-class; and in 1846, elected a member of the Chamber of Deputies. Under the Republic, he lost his various employments. He published, in 1848, *Letters on the Organisation of Labour and the Question of the Labourers*; and after the coup d'état of December 2, was restored to his professorship, and named councillor of state. In 1860, C. assisted Mr Cobden in carrying into effect the commercial treaty between France and England, and was created a senator. He became a Grand Officer of the Legion of Honour, 1861. Besides the works mentioned, he has written

*Political Economy* (1842—1850); *Probable Fall of the Value of Gold* (1859—translated by Cobden); *Mexico, Ancient and Modern* (1863); &c.

CHEVAUX-DE-FRISE, in Fortification, is a hastily constructed substitute for a regular abattis, to stay the progress of an advancing enemy. It may be constructed in any way of wood or iron, provided it presents an array of sharp or ragged points towards the enemy. Sometimes it is made of barrels or centres of timber, with spears springing out from all sides, in such a way as to constitute both a support and a defence. Among

Cheval-de-Frise.

the *mairies* of an army under the care of the engineers, are sometimes comprised C. formed of cylindrical iron barrels, about 6 feet long, each having 12 holes to receive as many spears; the spears can be packed away in the barrel, when not in use. Each such piece constitutes a *cheval*, and many such, ranged end to end, form *chevaux*, to be used in ditches around a fortification, on the berme beneath the parapet, behind the glacis, across a breach in the rampart, or in any spot where a check to the storming-party is needed. At Badajoz, during the Peninsular war, great service was rendered by a C. formed of sword-blades fixed into beams of wood. The name is said to have been derived from 'Friesland horse,' and to have been first applied by the French during the wars of the 17th century.

CHEVIOT HILLS, a mountain-range occupying contiguous parts of the counties of Northumberland and Roxburgh, on the English and Scotch borders, and running 35 miles from near the junction of the Till and Tweed, in the north-east, to the sources of the Liddel, in the south-west. The highest points are C. Hill, 2684 feet, and Carter Fell, 2020. West of Carter Fell, these hills chiefly consist of carboniferous sandstone and limestone, with protrusions of trap. The east portion of the range is porphyritic, and includes higher and more or less conical hills. In the C. H. are the sources of the Liddel, Tyne, Coquet, and some of the branches of the Tweed. Grouse abound, and the golden eagle is seen. These hills afford pasture for the Cheviots, a superior breed of sheep. They have been the scene of many bloody contests between the English and Scotch.

CHEVRETTTE. See GYN.

CHEVREUL, MICHEL EUGÈNE, a distinguished French chemist, born August 31, 1786, at Angers, in the department of Maine-et-Loire. In 1820, he was made an examiner in the Polytechnic School; and in 1824, director of the dyeing department in the manufactory of the Gobelins. This last position led him to institute a series of accurate researches on colours, the results of which he made known in a series of *Mémoires* of the Academy of Sciences. Previous to this, C. had made himself known in the scientific world by a variety of researches and writings. In 1826, he was made a member of the Academy; and in 1830, Professor of Applied Chemistry in the Museum of Natural History. Besides a great number of articles in the *Journal des Savants*, beginning with 1820, the

*Chimie appliquée à la Teinture* (1828—1831); *De la Loi du Contraste simultané des Couleurs et de l'Assortiment des Objets colorés* (1839); *Théorie des Effets Optiques que présentent les Étoffes de Soie* (1846); *De la Baguette divinatoire, du Pendule, et des Tables tournantes* (1854); and *Des Couleurs et leur Application aux Arts Industriels* (1864). C. is a Fellow of the Royal Society of London, a Commander of the Legion of Honour, and was Director of the Museum for Natural History.

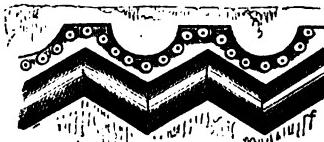

CHEVRON, in Heraldry, an ordinary representing the couples or rafters of a house, and supposed to betoken the accomplishment of some memorable work, or the completion of some business of importance, generally the foundation of his own family by the bearer. The C. is formed of two lines placed

Chevron.      Chevronel.      Per Chevron.

pyramidically, i. e., joined together at the top, and descending to the extremities of the shield in the form of a pair of compasses. *Chevronel*, a diminutive—half the size—of the chevron. *Per chevron*, or *party per chevron*, is where the shield is divided by a line in the form of the chevron.

CHEVRON, in Architecture, a moulding in the form of a succession of chevrons, otherwise called a zigzag moulding. In general, it is characteristic of

Chevron, or Zigzag:  
Andover, Hants.

Norman architecture, but is also found with the pointed arch, during the transition period from Norman to Early English.

CHEVRONS are braids or bands of lace, worn as distinguishing marks by the non-commissioned officers of regiments. The corporals, and the various grades of sergeant, have C. varying from one to four in number, either of white or of gold lace. In most corps, they are worn on the right arm only; but in the Guards, the Fusiliers, the Light Infantry, and the Grenadier and Light Infantry companies of the ordinary regiments, on both arms.

CHEVY CHASE, the name of perhaps the most famous of British ballads. In its present form, the piece does not seem to be older than about the beginning of the 17th century. But more ancient versions, doubtless, existed; and Bishop Percy has published a poem of the 16th c., which has obviously suggested passages in the more recent composition. It is impossible to reconcile its incidents with history, but the event which is meant to be commemorated appears to have been the battle of Otterburn, in August 1388—a fight which Froissart declares to have been the bravest and most chivalrous which was fought in his day. According to the ballad, Percy vowed that he would enter Scotland, and take his pleasure for three days in the woods of his rival, and slay the deer therein at will. Douglas, when he heard the vaunt,

than enough.' Accordingly, hay-harvest, Percy, with stag-passed into the domains of 'hundred fallow-deer and harts English had hastily cooked th about to retire, Earl Douglas, heading his Scottish spears, Haughty challenge and defia the potentates, and the battle j of the fray the two leaders met cried Douglas. 'I will yield to born of woman!' cried Percy, an English arrow struck D 'Fight on, my merry men!' Percy, with all the chivalrou took the dead man by the l he would have given all his l a braver knight never fell by Hugh Montgomery, having se clapped spurs to his horse, d struck his spear through his l and more. Although the lead fallen, the battle, which had continued till the ringing of t men and Englishmen claim t battle ended, representatives on either side of the bord greensward.

CHEYNE, GEORGE, an e cian, born in Aberdeenshire intended for the church, but profession, studied at Edin brated Dr Pitcairn. In 1 degree of M.D., he repaired practised in winter, and in F full living he became enor asthmatic, and resolved on milk and vegetable diet, fro much benefit that he recon principal medical treatises. *A New Theory of Fevers, On Fluxions*, which procur the Royal Society. Among *Philosophical Principles of Observations on Gout*, 1722 *Long Life*, 1725; *The Eng on Nervous Disorders*, 173 1739; *Account of Himself* 1743. Dr C. died at Bath,

CHIABRERA, GABRIELI at Savona, 8th June 1552. Rome under the care of his he entered the service of C obliged to leave it in cons he had taken on an Italidone him an injury. In h and remained independent He died 14th October 163 developed itself late. Hav the Greek writers at hom admiration of Pindar, and imitate him. He was not the naive and pleasant s canzonetti being distingui elegance, while his *Lettres* attempt to introduce the p literature. C. also wrote's dramatic poems. His *Ope* 6 vols., 1768.

CHIA'NA (in ancient Tuscany, formed by se Apennines, and falling int below Arezzo. Along wi same name, which, flowing

enters the Paglia at Orvieto, it waters the perfectly level Val di Chiana, which its overflow rendered once the most pestilential district of Italy. Ferdinand III. and his minister, Fossumbroni, undertook extensive hydraulic works for improving the bed of the river, which they led through the lakes of Montepulciano and Chiusi, and employed for the artificial irrigation of the whole valley. The district has since become the most fruitful, perhaps, of all Italy—a perfect garden, supporting a population of more than 100,000.

**CHIAPA**, or **CHIAPAS**, a state in the south-east of the Mexican confederation, lying to the south-west of Yucatan, and extending in lat. between 16° and 18° N., and in long. between 90° 30' and 94° W. It contains about 19,000 square miles, and 194,000 inhabitants, chiefly aborigines. Near Palenque, one of the towns of C., are some of the most extensive and magnificent ruins in Central America.

**CHIARAMONTE**, a town of Sicily, about 32 miles west-south-west of Syracuse. It is situated on a hill, and has well-built, regular streets. Wine of good quality is produced in the district. Pop. about 8000.

**CHIARI**, a town of Lombardy, 14 miles west of Brescia, on the railway between that place and Milan. It is an ancient place, many Roman remains being still found here; and at one time it was strongly fortified, but its walls are now ruinous. Silk is the staple manufacture. Pop. 10,000.

**CHIAROSCUCRO** (Ital.), an artistic term, composed of two Italian words, the one of which signifies light, the other darkness or shadow. But C. signifies neither light nor shadow; neither is it adequately described by saying that it is the art of disposing of both the lights and shadows in a picture, so long as either is regarded apart from the other. It is rather *the art of representing light in shadow and shadow in light*, so that the parts represented in shadow shall still have the clearness and warmth of those in light, and those in light the depth and softness of those in shadow. It is not the making of the one die softly and gradually away into the other, but the preservation of both in combination, as we constantly see it in nature, when the light is not the mere glare of the sun striking on a particular object, nor the shadow the entire absence of the influence of light. That the skilful treatment of C. is a matter of extreme difficulty, is plain enough from the very small number of artists who ever attain to it. Still, it is a branch of art without the mastery of which no painting can be successful in any department. It is as indispensable in portrait-painting as in the highest departments of ideal art; and though a just and even a lofty conception of the subject may be distinctly indicated by attention to form alone, it is impossible that its realisation can ever be satisfactorily accomplished by any one who has not mastered this most subtle mode of handling colours. The only mode by which a knowledge of C. can be attained, so as to apply it to practice, is by studying it as exhibited by such painters as Titian, Rubens, Rembrandt, and, above all, Correggio.

**CHIAVARI**, a maritime town of Piedmont, situated on the Gulf of Rapallo, at the mouth of the Sturla, 21 miles east-south-east of Genoa. The houses in general are well built, with open arcades skirting the narrow streets. C. has several fine churches, the principal of which is the *Madonna del Orto*. Numerous picturesque old towers, one of them of considerable size, are scattered over the town. Lace and silk are manufactured here; and

the place is also noted for its light, handsome, cheap furniture, made chiefly of cherry-wood. The anchovy fishery is important; and in the vicinity are extensive slate-quarries. Pop. 10,457.—The old province of C., of which the above town was the capital, had an area of 155 square miles, with a population of 109,212. Its surface is generally mountainous, but it has valleys of great fertility, yielding grain, grapes, olives, &c. Cattle, sheep, goats, and silkworms are reared.

**CHIAVENNA**, a town of Lombardy, beautifully situated in the midst of vineyards, at the junction of the valley of St Giacomo and Val Bregaglia, 38 miles north-north-west of Bergamo. It is overlooked by the Rhetian Alps; and its position on the Splügen road secures it considerable traffic. Silk, cotton, and a coarse ware cut out of a soft stone found in the neighbourhood, are the chief manufacture. Pop. about 4000.

**CHICA**, a red feculent substance, valuable as a dye-stuff, giving an orange-red colour to cotton. It is obtained by boiling the leaves of a species of *Bignonia* (*B. Chica*), a native of the banks of the Cassiquiare and the Orinoco. The Indians use it for painting their bodies. The C. plant is a climber, with abruptly bipinnate leaves, smooth heart-shaped leaflets, and flowers in pendulous axillary panicles. See *BIGNONIACEAE*.

**CHICA, PITO, POSO, or MAIZE BEER**, is a fermented liquor made from maize or Indian corn. It is much used in some parts of South America, and is made in a similar manner to ordinary beer; but the Indians sometimes prepare it by chewing instead of crushing the grains; and that which is so prepared (*Chicha maceada*, or chewed C.) is most highly esteemed by them. When they wish to make this liquor particularly strong and well flavoured, they have also a practice of pouring it into an earthen jar, which contains some pounds of beef; and having made the jar perfectly air-tight, they bury it several feet deep in the ground, where it is left for several years. On the birth of a child, it is their custom thus to bury a jar of C., to be drunk at the same child's marriage. C. has an agreeable flavour, and is very strong and intoxicating. A spirituous liquor is obtained from it by distillation; vinegar is also made from it.

**CHICACOLE**, a town of the district of Ganjam, in the presidency of Madras, being in lat. 18° 18' N., and long. 83° 58' E., and lying 415 miles to the south-west of Calcutta, and 435 to the north-east of Madras. It stands on the left or north bank of the Naglandee, not far from the Bay of Bengal. It is a military station, and contains, besides its garrison, about 15,000 native inhabitants. The place has a reputation for its richly worked muslins.

**CHICAGO** (pronounced *She-kaw-go*), the principal city of Illinois, and seat of Cook county, is situated on the south-western shore of Lake Michigan, at the mouth of the Chicago River, lat. 41° 50' 20" N., long. 87° 37' W. The name is of Indian origin, signifying 'wild onion,' and is first mentioned by Perrot, a Frenchman, by whom it was visited in 1671. In 1803, a stockade fort was erected near the mouth of the river, and named Fort Dearborn. When the war with Great Britain broke out in 1812, the government, apprehensive that a post among the Indians so far from the frontiers could not be successfully maintained, ordered the commander to abandon it. The Indians destroyed the fort, which was rebuilt in 1816. C. was first settled in 1831, previous to which time it was a mere frontier-post; in 1832, it contained about a dozen families, besides the officers and soldiers in Fort Dearborn. The town was organised

1836. In September 2d. of the same year, a treaty was made for all their lands with the Pottawatomies, 7000 of the tribe being present, after which they were removed west of the Mississippi River. The first charter of the city was passed by the legislature March 4, 1837. The following table exhibits the rapid increase of Chicago. The estimated number of the population in 1835 was 1000, and the exact number, according to the census returns, was, in

1840.	4,470	1853.	60,652
1843.	7,580	1854.	65,872
1845.	12,080	1855.	83,509
1847.	16,859	1860.	180,000
1848.	20,030	1865.	187,446
1849.	23,047	1870.	298,977
1850.	28,260	1871.	330,000
1852.	38,733		

C., perhaps the most remarkable city in the world for its rapid growth, is built upon a plain sufficiently elevated to prevent inundation. Within the past 14 years, the elevation of the principal streets, also the buildings, have been raised from 4 to 10 feet, the object of this gigantic undertaking being to admit of a thorough system of sewerage. The Chicago River and its branches separate the city into three divisions, connected by bridges, placed upon a turn-table or pivot. The main stream, flowing directly west, is about 100 yards wide, and forms one of the best harbours on the lakes. Vessels ascend the river and its branches a distance of 4 miles from its mouth, thus affording nearly 18 miles of wharfage. The water for the city is now supplied by a tunnel from Lake Michigan, which was opened in 1867, and supplies 57,000,000 gallons daily.

The Illinois and Michigan Canal, completed in 1848, connects the Chicago and Illinois rivers, thus affording communication between the lakes and Mississippi to the coal-fields of Illinois, and to the vast quarries of so-called Athens marble, regarded as the finest building-material in the country. It is found on the banks of the canal, about 20 miles from C.; and is easily worked when first quarried, like the Caen stone.

The 36 public schools of C.—some capable of holding 1000 children—afford the means of education, free of charge, to every child in the city. At the head of the system is the High School. Here the sons and daughters of the poorest man may aspire to the highest honours in the classics and modern languages. There are also numerous private schools and seminaries, besides several universities, medical colleges, theological, literary, and scientific institutions located in Chicago.

Since 1853 pork-packing has been conducted on an enormous scale. In 1869, 403,102 head of cattle were received; and about 100,000 packed as beef; 1,661,869 hogs received; and about 550,000 packed as pork. Since 1854, C. has been the largest primary grain-dépôt in the world. In 1869, 64,526,930 bushels of bread-stuffs were received, and 56,759,719 shipped. C. is also the most extensive lumber market in the world. In 1869, 37,194,000 sheets of daily and weekly newspapers were issued.

In October 1871, a terrible fire occurred, which burned 18,000 houses, extending over more than 2000 acres; 200 persons perished, and nearly 100,000 were rendered homeless. The property burned was estimated at 200,000,000 dollars. This stupendous calamity awakened the practical sympathy of the civilised world. Great Britain and other countries subscribed money freely for the sufferers. The city was entirely rebuilt in a style of great magnificence within two years.

rate the Gulf of Mexico from the Caribbean Sea, 18 miles to the south-west of Valladolid. It is one of the principal towns of the state, and is worthy of notice chiefly for the remains of an ancient city, comprising a ruined temple 450 feet long, a pyramid with a base of 550 feet square, and a domed edifice ornamented with sculpture.

CHICHESTER, a municipal and parliamentary borough and episcopal city in Sussex, 17½ miles east-north-east of Portsmouth. It stands on a plain between an arm of the sea and the South Downs, which rise gently on the north. It is well built, and has wide streets. The two main streets cross at right angles, and meet in an elaborately worked eight-sided cross. Within the suburbs the city is surrounded by an ancient wall, 1½ mile in circuit, with some semicircular bastions, and now a promenade under the shade of elms. The cathedral, erected in the 12th and 13th centuries, on the site of a wooden one founded 1108, and burned 1114, measures 410 by 227 feet, with a spire 300 feet high. The aisles are double—a mode of construction to be seen nowhere else in Britain. The cathedral has a rich choir, and portraits of the English sovereigns from the Conquest to George I., and of the bishops down to the Reformation. The chief trade is in agricultural produce and live-stock. There are malting, brewing, and tanning establishments. Pop. 9054. C. returns one member to parliament. The harbour, 2 miles to the south-west of the city, is a deep inlet of the English Channel, of about 8 square miles; has several creeks and Thorney Isle; and is connected with C. by a canal. C. was the Roman *Regnum*, and has afforded Roman remains—as a mosaic pavement, coins, urns, and an inscription of the dedication of a temple to Neptune and Minerva. C. was taken and partly destroyed, in 491, by the South Saxons. It was soon after rebuilt by Cissa, their king, and called Cissancaster, or Cissa's Camp. It was for some time the capital of the kingdom of Sussex. In 1642, the royalists of C. surrendered to the parliamentarians after a siege of ten days.

CHICK PEA (*Cicer*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*,

Chick Pea.

having pinnate leaves; solitary, axillary, stalked

## CHICKEN-POX—CHICORY.

flowers; and two-seeded pods, inflated like bladders. The common C. P. (*C. arcticum*) grows wild in the cornfields of the countries around the Mediterranean Sea, and in many parts of the east. It is an annual, 1½—2 feet high, of a stiff upright habit, covered with glandular hairs. The seeds abound in farina, and have a slightly bitterish taste. They are about the size of common peas, curiously wrinkled, so that they have been thought to resemble a ram's (*arieti*) head. They are used as food, either boiled or roasted, and are the most common *porched pulse* of the East. They are an important article of French cookery. They have been in general use from the earliest times, and the plant is extensively cultivated in Egypt, Syria, India, the south of Europe, &c. Its cultivation extends as far north as the southern parts of Germany; but in the climate of Britain it is found too tender to be a profitable crop. It is the *Gram* of India, and the *Garvance* of the French, whence the English name *Caravane*. The herbage affords a nutritious food for cattle, and the seeds are one of the occasional substitutes for coffee. In great summer heats, drops exude from this plant, which, on drying, leave crystals of almost pure oxalic acid.

**CHICKEN-POX**, a contagious febrile disease, chiefly of children, and bearing some resemblance to a very mild form of small-pox (q. v.). C. is distinguished by an eruption of vesicles or blebs, which rarely become pustular or yellow, and leave only a very slight incrustation, which falls off in a few days, without any permanent mark or pit, as in small-pox. From its vesicular character, it has been called the *crystal pock*. It has been argued that C. is, in fact, only small-pox modified by previous vaccination; but this opinion, though maintained on good authority, is not generally received by medical men. It is a disease of little or no danger, the fever being often hardly perceptible, and never lasting long.

**CHICKWEED** (*Stellaria media*), one of the most common weeds of gardens and cultivated

Chickweed (*Stellaria media*):

a, branch with leaves and flowers, reduced; b, a flower; c, parts of fructification.

fields, is a species of STITCHWORT (q. v.). It is a native of most parts of Europe and of Asia, appearing during the colder months even on the plains of India; an annual, with a weak procumbent stem and ovate leaves, very variable; some of the smaller

varieties in dry sunny situations sometimes puzzling young botanists, from having only five or three instead of ten stamens; but always characterised by having the stem curiously marked with a line of hairs, which at each pair of leaves changes from one side to another, and in four changes completes the circuit of the stem. The leaves of C. afford a fine instance of the *sleep of plants*, closing up on the young shoots at night. C. is a good substitute for spinach or greens, although generally little regarded except as a troublesome weed, or gathered only by the poor to make poultices, for which it is very useful, or for feeding cage-birds, which are very fond both of its leaves and seeds. A number of species of a nearly allied genus, *Cerastium*, natives of Britain, also bear the name of C., or *MOUSE-EAR C.*, and the name is occasionally given to other plants, either botanically allied, or of somewhat similar appearance.

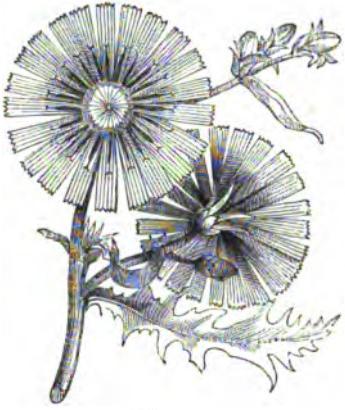

**CHICLANA**, a town of Andalusia, Spain, about 12 miles south-east of Cadiz. It is pleasantly situated on a plain between two hills, and its houses being all built of white stone, present a cheerful appearance. It has a splendid hospital. The manufacturers are linen, earthenware, and brandy. Its mineral baths are much frequented by the inhabitants of Cadiz. Population variously estimated, but probably about 5000.

**CHICORY**, or **SUCCORY** (*Cichorium*), a genus of plants of the natural order Composite, sub-order *Cichoraceæ*, distinguished by bracts in two unequal rows, the outer always reflexed, the inner latterly becoming so, a nearly naked receptacle, obovate striated achenia, and a pappus of two rows of minute scales. The species are few in number, herbaceous plants, full of milky juice, natives chiefly of the warmer temperate regions of the eastern hemisphere. The common C. or **SUCCORY** (*C. Intybus*) is a perennial plant, found wild in England and most parts of Europe, growing in waysides, borders of fields, &c. It has a long carrot-like root, externally of a dirty or brownish yellow colour, and white within. The stem rises to the height of 2—5 feet, branching, the leaves are *runcinate*, resembling those of the dandelion; the flowers sessile, axillary, in pairs, rather large, beautiful, generally blue, more rarely pink or white. C. is pretty extensively cultivated, both in England and on the continent of Europe, for its roots. It is also cultivated for feeding cattle with its leaves. The blanched leaves are sometimes used as a salad, and they are readily procured in winter by placing the roots in a box with a little earth in a cellar.—To this genus belongs also the **ENDIVE** (q. v.).

Chicory Root.

C. has been used as a substitute for coffee, or to mix with coffee, for at least 80 years. The roots are pulled up, washed, cut into small pieces, and dried on a kiln, which leaves a shrivelled mass not more than one-fourth the weight of the original root. It is then roasted in heated iron cylinders, which are kept revolving as in coffee-roasting, during which it loses about 25 to 30 per cent. of its weight, and evolves at the same time a disagreeable odour, resembling burned gingerbread. An improvement to the C. during roasting is the addition of 2 lbs. of lard or butter for every cwt. of C., which communicates to it much of the lustre and general appearance of coffee. It is then hand-picked, to remove chips of wood, stones, &c., and is reduced to powder, and sold separately as *C. powder* or *C. coffee*, or is added to ordinary ground-coffee, and is sold as a mixture. C. contains a good deal of sugar, but otherwise does not serve to supply the animal economy with any useful ingredient. It gives off a deep brown colour to water, when an infusion is made, and hence its main use in coffee. Some people dislike the taste of C., and when largely

Chicory.

used, it has a tendency to produce diarrhoea; but many people prefer to use coffee mixed with C. owing partly to the taste it communicates, but mainly to the appearance of strength which it gives to the coffee. The C. is liable to adulteration; and roasted beans, pease, carrots, parsnips, mangold-wurzel, acorns, horse-chestnuts, biscuit, oak-bark tan, logwood and mahogany dust, and even the livers of horses and bullocks, are said to be employed in its adulteration.

**CHIEF**, in Heraldry, an ordinary formed by a horizontal line, and occupying the upper part of the escutcheon. Like the other honourable ordinaries, the C. ought properly to take up a third part of the shield; but when the other charges are numerous, the C. is frequently diminished in size.

**In Chief.** — Any object borne in the upper or chief part of the shield is said to be *in chief*, though the C. be not divided off from the rest of the field, as a separate portion.—*On a Chief:* Is when the object is represented on the C., divided off as above described.

**CHIEF-JUSTICE.** See JUSTICE COURTS.

**CHIEM-SEE**, a lake of Upper Bavaria, the largest in the country, lies about 42 miles south-east of Munich. It is situated at an elevation of more than 1500 feet above the sea; its length is 12 miles, 808

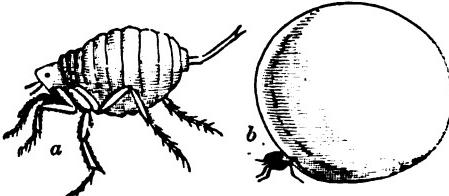

with a breadth of 9, and its greatest depth 480 feet. Its shape is irregular, and its coast much indented. It has three islands; the Achen and Prien flow into it, and its surplus water is discharged by the Alz into the Inn. The C. is famous for its fish; and a small steamer which plies on it, enables travellers to view its fine scenery.

**CHIE'RI**, a town of Piedmont, Northern Italy, situated on the slope of a hill 9 miles south-east of Turin. C. is an ancient place. By the later Romans it was called Carea. The church of St Dominico, built in 1260, has some good paintings; and that of Santa Maria della Scala, built in 1405, is one of the largest Gothic structures in Piedmont. C. is one of the oldest manufacturing towns in Europe, its manufacture of fustians and cotton stuffs dating from 1422. Silk, cotton, and linen are still important manufactures. Pop. 12,000.

**CHIETI**, an archiepiscopal city of Italy, capital of the province of Abruzzo Citra, is situated on a hill near the Pescara, about 100 miles north of Naples. It is a well-built and flourishing place, with some imposing public edifices, including a cathedral, lyceum, and theatre; and its agreeable situation has made it the residence of numerous wealthy families. The district around is fertile and well cultivated, and in the city, the cloth and silk manufactures afford employment for a considerable number of people. Pop. 20,000. C. is a very old place, being built on the site of the ancient Teate of the Romans, many of the remains of which are still visible. In the year 1524, St Gaetano founded here the order of the Theatines.

**CHIGNE'CTO BAY**, the more westerly of the two inlets at the head or north end of the Bay of Fundy, in British North America. It separates Nova Scotia from New Brunswick, is 30 miles long and 8 broad, and has an isthmus of only 14 miles in width between it and Northumberland Strait, in the Gulf of St Lawrence.

**CHIGOE**, or **JIGGER** (*Pulex*, or *Sarcopyle penetrans*), a species of Flea (q. v.), rather smaller than the common flea, and with less powerful limbs, found in the West Indies and South America, where it is excessively troublesome, attacking any exposed part of the human body, and effecting a lodgment between the skin and flesh, often under the skin of the foot or the nails of the toes. At first, its

Chigoe (*Pulex penetrans*):  
a, male; b, gravid female.

presence is indicated only by a slight itching or tingling; but an ulceration is likely soon to be the result, which is not only very painful, but even dangerous, when the female C. is allowed to remain and to deposit her numerous eggs. Before these are deposited, her abdomen becomes distended in an extraordinary manner, as a membranous bag, to the size of a pea. The ulcer speedily contains a great colony of chigoas. The negresses of the West Indies are very expert in extracting the C., which is also removed by washing with tobacco-juice. Rubbing with tobacco-leaves is also employed as a preventive of its attacks.

## CHIH-LE—CHILI.

CHIH-LE, or PECHIH-LE, one of the northern provinces of China, and the most important of the 18, as being the centre of government, and containing Pekin, the imperial capital, the residence of the emperor and court. Pop. about 28,000,000; area, 58,949 square miles.

CHIHUA'HUA, a city of the Mexican confederation, with 12,000 inhabitants, and a considerable trade between Santa Fé, in New Mexico, and the United States. It is in lat. 28° 40' N., and long. 105° 33' W., and has cathedral, convents, and an aqueduct 3 miles long, besides appropriate buildings, as the capital of the state of its own name. The territory in question, stretching in lat. from 27° to 32° N., and in long. from 104° to 108° 40' W., is divided from Texas, in the United States, by the Rio Bravo del Norte. It is a table-land, more remarkable for mineral resources than for agricultural productions. It abounds in nitre and other salts, and is rich in mines of gold and silver.

CHILBLAINS. See CHAPPED HANDS.

CHILD, SIR JOSIAH, an eminent London merchant, and one of the ablest of the earlier English writers on commerce and political economy, born in 1630, was the second son of Richard Child, a merchant of London. His principal work is entitled, *Brief Observations concerning Trade and the Interest of Money* (Lond. 1668, 4to); a 2d edition, much enlarged, entitled *A New Discourse of Trade*, was published in 1690. In this work he explains his plans for the relief and employment of the poor, including the substitution of districts or unions for parishes, and the compulsory transportation of paupers to the colonies. He was one of the directors, and for some time chairman of the East India Company, and is said to have written several tracts in defence of the trade to the East Indies, which were published anonymously. In 1678 he was created a baronet, and died in 1699.

CHILDERMAS, or HOLY INNOCENTS' DAY (28th December), is observed by the Church of Rome with masses for the children killed by Herod. It was considered unlucky to marry or to begin any work on this day. From Fenn's *Letters* (vol. i. p. 234) we learn that the coronation of King Edward IV. was put off till the Monday, because the preceding Sunday was Childermas Day. The learned Gregory says: 'It hath been a custom and yet is elsewhere, to whip up the children upon Innocents' Day morning, that the memory of Herod's murder might stick the closer, and in a moderate proportion to act over the crueltie again in kind.' C. is also a holiday of the Church of England.

CHILD-KILLING. See INFANTICIDE.

CHILD-STEALING. See ABDUCTION.

CHI'LI, a republic of Spanish origin, in South America, is the most southerly state on the west side of that continent. It lies wholly between the water-shed of the Andes and the shores of the Pacific, stretching coastwise from Bolivia to Patagonia, in lat. 25° 30'-43° 20' S., and in long. 69°-74° W., having an extreme length of about 1240 miles, and an average breadth of fully 120. Within these limits, however, lies the virtually independent Araucania (q. v.), comprising most of the mainland to the left of the Biobio; while the southern portion is confined chiefly to Chiloe (q. v.) and its archipelago. C. is divided into 15 provinces, of which, including certain outlying dependencies in Patagonia,

the aggregate area has officially been stated at nearly 140,000 square miles; and the population, in 1870, at 1,938,861. The capital is Santiago, situated pretty nearly in the heart of the country, and connected with Valparaiso, the principal port, by a railway of 90 miles in length, and also by telegraphic wires. The other towns are on or near the ocean; and, to arrange them according to the relative amounts of their trade, they are Valparaiso, Copiapo and Caldera, Coquimbo, Talcahuano, and Concepcion, Huasco, Constitucion, and Valdivia. The total exports of the republic amounted on the average of five years, from 1867 to 1871, to £6,000,000; and the imports during the same period to £5,200,000. The foreign commerce of C. is carried on mainly with Great Britain, to which two-thirds of the exports are sent. The staple article of export to this country is copper, the value of which, in 1871, was £2,370,180. The articles of export next in importance are, in order of value, silver ore, to the value, in the same year, of £478,504; wheat, to that of £327,855; raw cotton, £147,331; and wool, £111,812. The principal articles of British produce imported into C. are cotton and woollen manufactures. In 1871, the value of the total imports of cotton fabrics was £772,041, and that of woollens, £226,712. Among the other imports were iron, wrought and unwrought, to the value of £229,947; and hard-wares and cutlery valued at £88,598. The internal debt of C. is stated to be (in 1873) £1,406,250; and the foreign debt, £5,288,950. The army, according to the latest official returns, numbers about 5300, raised by conscription, and 30,000 national guards or militia. The navy, designed only for coast defence, consisted, at the commencement of 1872, of 9 vessels, carrying in all 40 guns. The commercial navy consisted, at the close of 1869, of 255 vessels, of 58,200 tons.

The Roman Catholic Church is established, and that practically to the exclusion of every other denomination. Of mixed marriages, the offspring, whether male or female, must be educated in the national faith. In its political constitution, C. appears to be the least democratic republic in the New World. The legislature is composed of two houses. The deputies sit for three years; and the senators are chosen for nine, retiring in thirds at the end of every third year. The voters for a deputy—to say nothing of the still more select voters for a senator—must possess either £100 in real property, or £200 in personal effects, or £20 of income; a pecuniary qualification which is exceptionally doubled for the wealthier localities of Valparaiso and Santiago. In 1848, attempts were made, but in vain, to abolish or modify these restrictions on the suffrage. Under this form of government, C. has maintained a degree of peace and prosperity utterly unknown to the other transatlantic commonwealths of kindred race. In this respect, however, the character of the people has doubtless co-operated with the tendency of the institutions. As contrasted with Spanish America in general, C. contains an unusually large proportion of European blood.

Immediately after the conquest of Peru, C. was seized by Almagro, a companion of Pizarro, subsequently becoming the seat of a captain-generalship, which held sway as far as Cape Horn. In 1810, commenced the war of independence, which, at the close of eight years, was decided against Spain by the victory of Mayo.

*Geology.*—The predominant rocks of C. are crystalline and metamorphic. They form the range of the Andes, except in those districts in which active volcanoes exist, where they are covered with recent volcanic rocks. They occupy also the whole of the level ground between the mountain-range and the

shores of the Pacific, with the exception of a narrow stretch of paleozoic fossiliferous strata which run along the coast south from Santiago for a distance of 300 miles. The coast-line of C. is being continually altered from the elevation of the whole country to an extent of at least 1200 miles along the Pacific shores, produced by volcanic agency. In 1822, the coast was raised 4 feet at Quintero, and 3 feet at Valparaiso. Oysters and other mollusks were left dry, and perished, becoming offensive as they decomposed. The change of level was permanent, over an area of 100,000 square miles, nearly as large as the whole extent of Great Britain and Ireland. A similar extensive elevation was noticed in 1835 by Captain Fitzroy.

Physically, the continental portion of the republic—for its insular section will, in this respect, be noticed under the head of CHILOE—presents many singularities. Of all the maritime regions on the globe, it is perhaps the most isolated. On every side but the sea—and that sea very remote from the main thoroughfares of commerce—it is beset by difficulties of communication. With the lonely wilderness of Patagonia to the south, and the dreary desert of Atacama on the north, it is bounded on the east by a mountain-chain which, altogether impracticable in winter, can be crossed, even in summer, only by a few passes ranging between 12,450 feet and 14,370 in elevation. Moreover, this strip between the Andes and the Pacific is broken into plateaus in the interior, and valleys on the coast, by two longitudinal ranges, with numerous lateral spurs; while, throughout the length and breadth, the general level gradually descends, as well to the south as to the west. In point of mere temperature, so rugged a surface—covering fully 15° of latitude, and attaining an altitude of more than 4 miles within about 2° of longitude—must present nearly every possible variety. Through the reciprocal action of the Andes (q. v.) and the prevailing winds, the rain-fall gradates itself, with something of mathematical regularity, from the parching skies of the north to the drenching clouds of the south—a graduation which, disturbed merely by the melting of the mountain-snows, is, in a great measure, necessarily reflected in the condition and magnitude of the countless water-courses. Hence the rivers to the north of the Mayo, which enter the Pacific near latitude 34°, are but inconsiderable streams; while, further to the south, the Maule, the Biobio, and the Calacalla are all to some extent navigable.

From the cause last mentioned, different districts vary remarkably in their productions. To the north of the Coquimbo, about lat. 30°, is chiefly an arid waste, redeemed, however, from being valueless by its mines; and to the south of the Biobio, about lat. 37°, timber and pasturage divide the soil between them. The intermediate centre alone is fitted for agriculture, yielding, besides maize and hemp, European grains and fruits in abundance. Notwithstanding all the varieties and vicissitudes of climate, the country may claim to be, on the whole, extremely healthy. The manufactures are earthenwares, copper-wares, linens, cordage, soap, leather, and brandy; and, in addition to the wheat and metals already specified, the exports, especially from the south, embrace tallow, hides, jerked beef, and live-stock. C. had, in 1871, 600 miles of railways; and a line is projected connecting it with Buenos Ayres, and going over a pass of the Andes 6000 feet high. There are also common roads; but they are neither numerous nor good. In fact, the want of highways and bridges is a serious obstacle to the progress of trade and cultivation. In the basin of the Lower Biobio, coal is plentiful.

CHILI, or CHILLI. See CAPSICUM.

CHILI NETTLE. See LOASACKE.

CHILI SALT-PETRE is a commercial name applied to the nitrate of soda. See SODA, NITRATE.

CHILLIANWALLA, a village of the Punjab, being 5 miles from the left or east bank of the Jhelum, the most westerly of the five rivers which give name to the country. It is in lat. 32° 40' N., and long. 73° 39' E., being 85 miles to the northwest of Lahore. C. claims notice as the scene of Lord Gough's dearly won victory, over the Sikhs, of January 1849, and also as the site of an obelisk erected to the memory of those who fell in the two Sikh wars.

CHILLINGWORTH, WILLIAM, a famous theologian of the Church of England, was born at Oxford in 1602, and educated at Trinity College in that university, where the arguments of a Jesuit named Fisher induced him to become a Roman Catholic. He withdrew to Douay; but was induced by his godfather, Dr Laud, then Bishop of London, to re-examine the whole controversy between Catholics and Protestants, and in 1631, he returned to the bosom of the Anglican Church. Four years later, he published a work, entitled *The Religion of Protestants a Safe Way to Salvation*. It was exceedingly keen, ingenious, and conclusive in point of argument. C. was perhaps the ablest disputant of his age; and had there not been a certain fickleness and want of solidity about his intellect, and a nervous suspicion that all human reasoning might be vitiated by undiscovered fallacies, he might have produced a really great work. *The Religion of Protestants* acquired a wide popularity. C. was offered church preferment, which he at first refused—having certain scruples in regard to the subscription of the 39 Articles—but afterwards accepted. He became Chancellor of the Church of Sarum, and prebendary of Brixworth, in Northamptonshire. He was a strong royalist, and on the breaking out of the civil war, accompanied the king's forces. He died January 1644. The best edition of *The Religion of Protestants* appeared in 1742, with sermons, &c., and a life of the author, by Dr Birch.

CHILLON, a celebrated castle and fortress of Switzerland, in the canton of Vaud, 6 miles south-east of Vevey. It is situated at the east end of the Lake of Geneva, on an isolated rock, almost entirely surrounded by deep water, and is connected with the shore by a wooden bridge. The castle is said to have been built in 1238, by Amadeus IV. of Savoy, and it long served as a state prison. It is famous as the prison of Bonnivard, the prior of St Victor, who having, by his efforts to free the Genevese, rendered himself obnoxious to the Duke of Savoy, was carried off by emissaries of that potentate, and confined here for six years, at the end of which time the castle had to surrender to the Bernese and Genevese, when Bonnivard was liberated. C. has been immortalised by Byron's *Prisoner of Chillon*. The castle is now used as a magazine for military stores.

CHILOE, the insular province of Chili (q. v.), is an archipelago on the west side of South America, which takes its name from its principal island. It is separated from the rest of the republic, or rather from Patagonia, by the Gulf of Ancud, extending in S. lat. from 41° 40' to 43° 20', and in W. long. from 73° to 74°. The province—which, in 1870, numbered 62,983 inhabitants—contains, in addition to C. Proper, about 60 islets, of which about 30 are uninhabited. In the archipelago are two towns, both of them seaports of C. Proper—Castro, the ancient capital, on the east coast; and San Carlos, the modern seat of government, towards the

## CHILOGNATHA—CHIMERE.

north-west extremity. The atmosphere, like that of the mainland opposite, is excessively moist; the westerly winds, more particularly in winter, bringing almost constant rains. The climate, however, is on the whole healthy. This fact is the more remarkable, inasmuch as C. Proper is one natural forest, measuring 100 miles by 40, with a partially cleared and cultivated margin on the sea. The chief products are wheat, barley, potatoes, apples, and strawberries; and cattle, sheep, and pigs are reared in considerable numbers. Agriculture, however, is in a very primitive state; and the staple food of many consists of mussels and oysters. The population, equally indolent and poor, differs from that of the rest of Chili in the great preponderance of aboriginal blood. Schools are numerous; but, from the ignorance of the teachers, education has not made satisfactory progress. The principal manufacture is a coarse woollen cloth, dyed blue. This archipelago was discovered by the Spaniards as late as 1558; and as it was the last integral portion of Spanish America to be colonised, so also was it the last to throw off the mother-country's yoke.

**CHILOGNATHA AND CHILOPODA.** See **MYRIAPODA.**

**CHILTERN HILLS**, the south part of the low chalk range which runs north-east, about 70 miles, from the north bend of the Thames, in Oxfordshire, through Bucks and the borders of Herts and Beds, and ends in Norfolk and Suffolk. In Oxford, Herts, and Beds, the C. H. are 15 to 20 miles broad, and the highest points are Wendover, 905 feet; and Whitehouse, 893.

**CHILTERN HUNDREDS.** In former times, the beech-forests which covered the Chiltern Hills, in Buckinghamshire, were infested with robbers, and in order to restrain them, and protect the peaceable inhabitants of the neighbourhood from their inroads, it was usual for the crown to appoint an officer, who was called the Steward of the Chiltern Hundreds. The office, which has long ceased to serve its primary, now serves a secondary purpose. A member of the House of Commons cannot resign his seat unless disqualified either by the acceptance of a place of honour and profit under the crown, or by some other cause. Now, the stewardship of the C. H. is held to be such a place, and it is consequently applied for by, and granted, in the general case as a matter of course, to any member who wishes to resign. As soon as it is obtained, it is again resigned, and is thus generally vacant when required for the purpose in question. When the C. H. are not vacant, however, the same purpose is served by the stewardship of the manors of East Hendred, Northhead, and Hempholme. As to the offices which are held to vacate seats, see **ELECTION**. 'The practice of granting the Chiltern Hundreds for the purpose above described began only about the year 1750, and its strict legality has been doubted, on the ground that the stewardship is not an office of the kind requisite to vacate a seat. The gift of the Chiltern Hundreds lies with the Chancellor of the Exchequer, and there is at least one instance of its being refused. In 1842, after very awkward disclosures had been made before a committee of the House of Commons, as to corrupt compromises, which had been entered into for the purpose of avoiding investigation into gross bribery in the election to certain boroughs, of which Reading was one, the member for Reading applied for the stewardship of the Chiltern Hundreds, and was refused—the Chancellor of the Exchequer being of opinion that, by granting it, he would in some sort have made himself a party to

transactions which he did not approve, and of which the House of Commons had implied its condemnation.'—*Standard Library of Political Knowledge*, p. 500.

**CHIMÆRA**, a genus of cartilaginous fishes, ranked by Cuvier with the Sturgeons (*Sturionidae*), but now generally regarded as the type of a distinct family, of which only two or three species are known. The gills have a single wide opening, as in the sturgeons; but the gill lid or *operculum* is merely rudimental, and concealed in the skin, whilst there is an approach to sharks in the structure of the gills. The only known species of C. is *C. monstrosa*,

Chimera Monstrosa.

occasionally found in the British seas, and more common in more northern latitudes. It is sometimes called the *King of the Herrings*. It pursues the shoals of herrings, and is consequently sometimes taken in herring-nets. It is seldom more than three feet long. Its general colour is silvery white, the upper parts mottled with brown. It produces very large leathery eggs.

**CHIMÆRA**, a mythical monster, described by Homer as having a lion's head, a goat's body, and the tail of a dragon. The rationalistic account of C. is, that it represented a mountain in Lycia whose top was the resort of lions, its middle of goats, and the marshy ground at the bottom of which abounded with serpents. In the same manner, Bellerophon's (q. v.) victory over the C. is explained by saying, that he first made his residence on this mountain. The myth seems, at all events, to have belonged to Asia Minor, as gigantic carvings of the C. on rocks are there found. It is usually represented as a lion, out of the back of which grows the head and neck of a goat.—C. is used figuratively to denote any monstrous or impossible conception, the unnatural birth of the fancy. It is frequently depicted on shields, as a heraldic charge.

**CHIMA'PHILA.** See **WINTER-GREEN**.

**CHIMBORA'CO**, a conical peak of the Andes, in Quito, 21,424 feet above the sea, but only about 12,000 above the level of its own tableland. It is capped with perpetual snow, and was long regarded as the loftiest mountain in the world. Latterly, however, it has been ascertained to be overtopped by some peaks, not merely of the Himalayas, but even of the central division of its own chain. Its lat. and long. are 1° 30' S., and 79° W. Though the summit of C. has never been reached, yet Humboldt ascended within 2138 feet of it, and Boussingault and Hall within 1729.

**CHIME'RE**, 'the upper robe worn by a bishop, to which the lawn-sleeves are now generally attached.' Since the time of Queen Elizabeth, it has been of black satin, but previously it was of a scarlet

parliament.

CHIMES, music performed on bells in a church tower, either by the hands of a performer or by mechanism. The most perfect C. are to be found in Holland and Belgium.

CHIMNEY (Fr. *cheminée*, Lat. *caminus*). There seems reason to believe that the C., in its present sense of a funnel from the hearth or fireplace to the roof of the house, is a modern invention. In Greek houses it is supposed that there were no chimneys, and that the smoke escaped through a hole in the roof. What the arrangement was in houses in which there was an upper story, is not known; perhaps the smoke was conveyed by a short funnel through the side-wall of the house, which seems to have been the first form of C. invented in the middle ages. The Roman *caminus*, again, was not a C., but a sort of stove; and it has been a subject of much dispute, whether the Romans had any artificial mode of carrying off the smoke, or whether it was allowed to escape through the doors, windows, and openings in the roof. As the climate and the habits of the people both led to the houses of the ancients being very much more open than ours are, it is probable that the occasional fires which they had of wood or charcoal may have given them no great inconvenience. It is known, besides, that the rooms in Roman houses were frequently heated by means of hot air, which was brought in pipes from a furnace below. In England, there is no evidence of the use of C.-shafts earlier than the 12th century. In Rochester Castle (*circa* 1130), complete fireplaces appear; but the flues go only a few feet up in the thickness of the wall, and are then turned out through the wall to the back of the fireplace, the openings being small oblong holes. The earliest C.-shafts are circular, and of considerable height. Afterwards, chimneys are found in a great variety of forms. Previous to the 16th c., many of

them are short, and terminated by a spire or pinnacle, having apertures of various shapes. These apertures are sometimes in the pinnacle, sometimes under it, the smoke escaping as from some modern manufacturing C.-stalls which are built in the form of an Egyptian obelisk. Clustered C.-stalls do not appear until late in the 15th c., when they seem to have been introduced simultaneously with the use of brick for this purpose. Each of the earlier clustered chimneys consists of two flues which adhere to each other, and are not set separate,

Tisbury, Wilts:  
From Parker's Glossary.

as afterwards was the practice. Long after they were invented, and in use for other rooms, our ancestors did not generally introduce them into their halls, which, till the end of the 15th, or beginning of the 16th c., continued as formerly to be heated by a fire on an open hearth in the centre of the hall, the smoke escaping through an opening in the roof known by the name of *louvre*. In many of the older halls in which chimneys exist, they have evidently been inserted about this period.

The action of a C. depends upon the simple principle, that a column of heated air is lighter than a cooler column of equal height; when therefore a flue full of heated air communicates freely

812

air upwards, and thus an ascending current is produced. Other conditions being equal, the draught of a C. will thus be proportional to its perpendicular height, and the difference between the temperature within and without it. The straighter and more perpendicular the C., the stronger will be the draught, because the friction of the ascending current will be less, and the cooling effect of a long or tortuous course will be saved. The maximum efficiency of a given C. is attained when all the air that passes up it enters by the bottom of the fire. In this case, its temperature is raised to the uttermost by passing through the whole of the fire, and the fire is at the same time urged to vivid combustion by the blast thus obtained. A powerful furnace may be constructed by connecting a suitable fireplace, capable of being closed all round excepting at the bottom, with a tall C.; and the amount of draught may be regulated by increasing or diminishing the aperture through which the air is admitted to the bottom of the fireplace, or by an adjustable opening above the fireplace, which will diminish the effective draught as its size is increased, or by a combination of both of these contrivances.

When the fireplace can be enclosed thus, there is little liability to descending currents or 'smoky chimneys,' as they are called, even when the C. is very short, or has a tortuous course. It is chiefly with open fireplaces that this defect occurs, and the means of prevention and cure is a subject of some interest and importance. As with most other evils, the prevention is far easier than the cure; for by properly constructing the C. in accordance with the principles above stated—by placing the opening of the C. as nearly over the fire, and contracting the open space above the fire, as much as possible—downward smoking may in most cases be easily prevented. When a C. is in the neighbourhood of a wall or building nearly as high as itself, or—what is still worse—higher, it is apt to smoke on account of the eddies and other complex currents in the air, caused by the interference which such an obstacle presents to the regular movement of the wind. In towns, such tortuous movements of the atmosphere are very common, and the contrivances for preventing the wind from blowing down the chimneys are very numerous, and often grotesque. Revolving cowls of various forms, but alike in having a nearly horizontal outlet, which is so turned by the wind that the mouth shall always present itself in the direction in which the wind is blowing, are the most common, and usually the most effectual. They are generally constructed of sheet-zinc, with an arrow, a flattened pigeon, or other device, as a vane, to determine the rotation of the cowl. The curing of smoky chimneys, in conjunction with the economising of fuel, was one of the favourite subjects of investigation of that very practical philosopher, Count Rumford. He says:

'Those who will take the trouble to consider the nature and properties of elastic fluids—of air, smoke, and vapour—and to examine the laws of their motions, and the necessary consequences of their being rarefied by heat, will perceive that it would be as much a miracle if smoke should not rise in a chimney—all hindrances to its ascent being removed—as that water should refuse to run in a siphon, or to descend a river. The whole mystery, therefore, of curing smoky chimneys is comprised in this simple direction: find out and remove those local hindrances which forcibly prevent the smoke from following its natural tendency to go up the chimney; or rather, to speak more accurately, which prevent its being forced up by the pressure of the heavier

air of the room.\* He then goes on to speak of above 500 smoking chimneys that he has had under his hands, and which were supposed incurable, and states that he was never obliged, 'except in one single instance, to have recourse to any other method of cure than merely reducing the fireplace and throat of the chimney, or that part of it which lies immediately above the fireplace, to a proper form and just dimensions.'

The figures illustrate his method of proceeding. Fig. 1 is a side view of a vertical section of a C. and fireplace before alteration; fig. 2, the same after

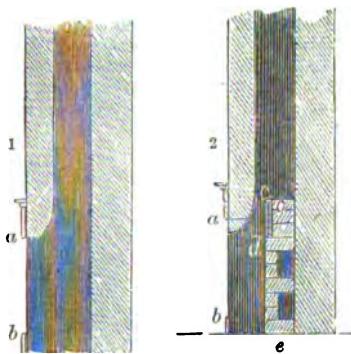

descending current is likely to be produced. The openings are best opposite the fire. For the methods of arranging and regulating such openings for the admission of air, see VENTILATION.

Tall factory-chimneys, usually built of brick, are very costly structures, many of them rivalling in height our loftiest cathedral spires. Their construction has been considerably economised by building from the inside, and thus saving the expensive scaffolding. Their walls are built very thick at the base, and gradually thinner upwards: recesses are left at regular intervals in the inside, and stout wooden or iron bars rest upon these to form a sort of temporary ladder for the workmen to ascend; the materials are hoisted by ropes and pulleys.

Sheet-iron chimneys are largely used in Belgium. They are much cheaper but less durable than brick, and are objectionable on account of their rapid cooling by the action of the external air.

**CHIMPA'NZEE** (*Troglodytes niger*), a species of ape; one of those which in form and structure exhibit the greatest resemblance to man. It is a native of the warmest parts of Africa; to which also the Gorilla (q. v.), a larger species of the same genus, belongs. The C. is sometimes called the Black Orang; but differs from the Orang (q. v.) (*Pithecia*) of Asia in the proportionally shorter arms, which, however, are much longer than those of man; in the possession of an additional dorsal vertebra, and an additional or thirteenth pair of ribs; and in other particulars, in some of which it more nearly resembles, and in others more widely differs, from the human species. In both, the difference from man is very wide in the general adaptation of the structure for movement on all-fours and for climbing and moving about among branches, rather than for erect walking, although the C. is able to move in an erect posture more easily than any other ape, usually, however, when so doing, holding its thighs with its hands; and still more in the form of the skull, and consequent aspect of the countenance, the facial angle being as low as 35° in the C. when it is measured without regard to the high bony ridges which project above the eyes; the jaws excessively projecting, and the outline of the face rather concave. There is also an important difference from the human species in the dentition; although the number of teeth of each kind is the same, the canine teeth of the apes is elongated, so as to pass each other, and corresponding intervals are provided for them in the opposite jaw. An interesting point of difference of the anatomy of the C. and Orang from that of man, is in the muscle which in man terminates in a single tendon, and concentrates its action on the great toe, terminating in the apes in three tendons, none of which is connected with the great toe or hinder thumb, but which flex the three middle toes; part of the adaptation of the foot for clasping as a hand. The great toe both of the C. and Orang is shorter than the other toes, and opposed to them as a thumb.

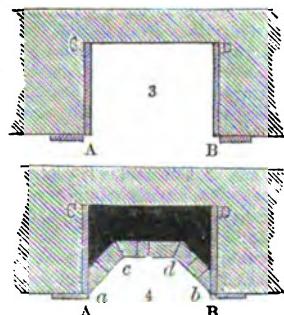

The C. does not seem to attain a height of quite four feet when in an erect posture. Its skin is thinly covered with long black hair in front; the hair is thicker on the head, back, and limbs. The ears are remarkably prominent, thin, and naked, not unlike human ears in shape. The nose appears as little more than a mere wrinkle of the skin. The thumb of the hand is small and weak, that of the foot comparatively large and powerful. In a wild state, the animal appears to be gregarious, but its habits are not well known. Truth and fable have been so mixed up in the accounts of it, that new information must be obtained from reliable

the reduction of the fireplace and throat of chimney. *ab* is the opening of the fireplace in both; this is lowered by the piece at *a*, fig. 2, and the depth diminished by the brickwork, *ce*, behind; *cd* is a movable tile, to make room for the C.-sweeper. Figs. 3 and 4 are plans of the fireplace, looking down upon the hearth: the original opening of the fireplace is shewn by ACDB, fig. 3; the contracted opening, by *acdb*, in fig. 4. The dark space is filled with rubbish and faced with brick-work.

The slope of *ac* and *bd*, fig. 4, is better adapted for radiation into the room than the square opening of fig. 3: the fire being brought further forward, has also more heating effect; the space of the fireplace being smaller, the air within it will with a given sized fire become hotter, and therefore have more ascending power; while in the contracted throat widening downwards, and having its sides strongly heated, there is a rapid rush of heated air, which carries the smoke upwards, and resists the passage of temporary down-draughts. Most modern chimneys and fireplaces are now constructed in accordance with Count Rumford's suggestions. See GRATE.

One frequent cause of smoky chimneys is the want of sufficient inlet for air to the room. Sandbags placed under doors, and other devices for preventing ventilation, may cause a well-constructed C. to smoke. Openings must exist somewhere, of sufficient capacity to supply the air which is to ascend the chimney. If the air enters the room on the same side as the fireplace, and sudden gusts of air pass across the front of the fireplace, a temporary

\* *Essays: Political, Economical, and Philosophical*, by Benjamin Count Rumford, vol. i. p. 299.

sources, before even things not in themselves very improbable can be believed. In a state of confinement, it exhibits, at least when young, considerable

Chimpanzee.

gentleness and docility, and readily learns to imitate human actions, in eating with a spoon, drinking out of a glass, and the like; but its intelligence does not appear to be superior to that of many other monkeys, or indeed of many kinds of brutes. Its natural food consists chiefly of fruit and other vegetable substances; in confinement, it exhibits a great fondness for sweetmeats and for wine. The C. is impatient of cold, and the climate of Britain soon proves fatal to it.

**CHINA.** See CHINESE EMPIRE.

**CHINA, or CHINA-WARE.** See PORCELAIN.

**CHINA BARK,** a name of Cinchona (q. v.) Bark, often to be met in books, and in common use on the continent. It is derived, not from the empire of China, but from *Kina* or *Quina*, the Peruvian name of cinchona.

**CHINA CLAY, or KA'OLIN.** See CLAY.

**CHINA GRASS, or CHINESE GRASS,** the popular name of a fibre used in China for the manufacture of a beautiful fabric known as *Grass-cloth*. The name appears to have originated in the belief that the fibre was that of a grass; but this is not the case, it being chiefly obtained from *Baehmeria* (q. v.) *nivea*, a plant allied to the nettle. Besides this and other species of the natural order *Urticaceæ*, other plants, as species of *Cochchorus* (q. v.) and *Sida* (q. v.), are believed to yield fibres employed in the same manufacture. The fibres are said not to be spun after the European manner, but joined into long threads by twisting their ends together. Grass-cloth is now brought in considerable quantity to Europe, especially in the form of pocket-handkerchiefs. It has a fine glossy appearance and a peculiar transparency.

**CHINA ROOT,** the root, or rather the rhizome (root-stock) of *Smilax China*, a climbing shrubby plant, closely allied to sarsaparilla, and belonging to the same genus; a native of China, Cochin-China, and Japan. See SARSA-PARILLA and SMILACEÆ. The stem is round and prickly, the leaves thin and roundish oblong; the rhizome tuberous and large; sub-astringent and diaphoretic. It is occasionally used in medicine, and is imported in a dry state into Europe; but it is also employed in the East as an article of food. It abounds in starch.

**CHINCHILLA**, a town of Spain, in the province of Albaocet, 10 miles south-east of the city of that name. It is situated on an abrupt rocky hill, crowned by a castle, and is surrounded by walls. The town is in general well built, with good streets, and a fine parish church, containing some excellent works of art. It has manufactures of cloth, linen, leather, earthenware, and glass, and a trade in the agricultural produce of the district. Pop. 7500.

**CHINCHILLA** (*Chinchilla, Eriomys, or Cullony*), a genus of South American quadrupeds, of the order Rodentia; the type of a family, *Chinchillidae*, allied to Cavies (*Capidae*), but differing from them in possessing clavicles. The general aspect is somewhat rabbit-like. There are several genera of *Chinchillidae*, distinguished in part by the number of toes; the true chinchillas having four, with the rudiment of a fifth on the fore-feet, and four on the

Chinchilla.

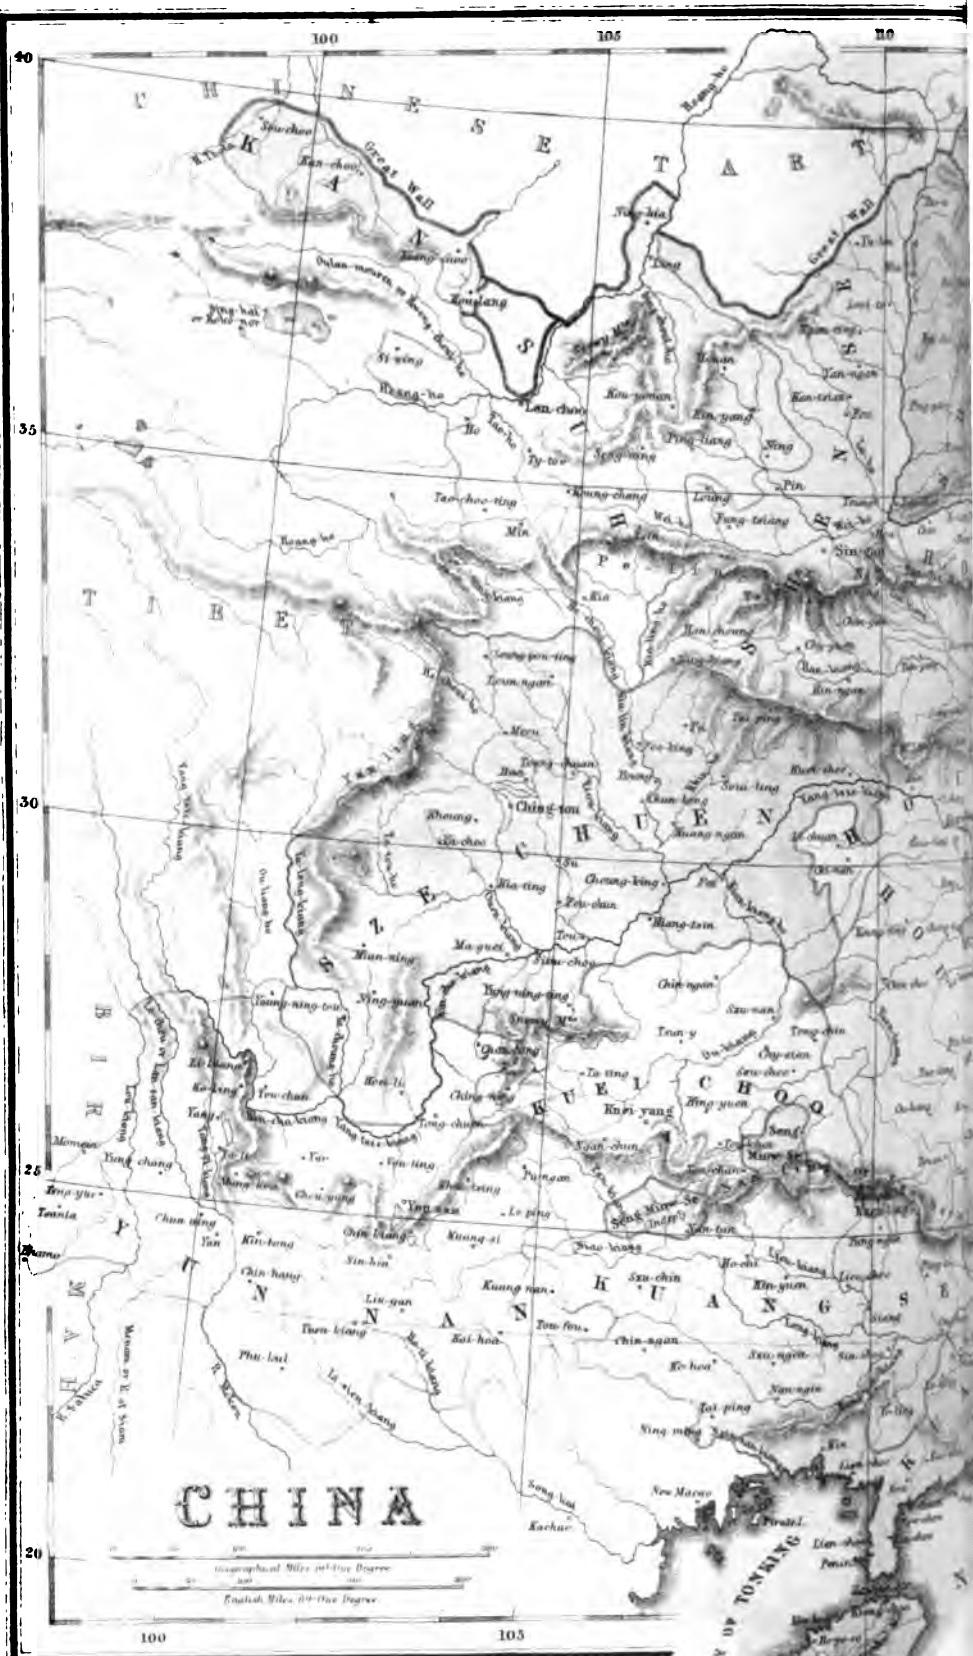

hind-feet; whilst in the genus *Lagidium* or *Lopis* there are four on each foot; and in *Lagotomus* four on the fore-feet and three on the hind-feet. All the species of this family are gregarious; feed much on roots, for which their strong and sharp incisors are particularly adapted; and live either in holes, which they select for themselves in rocky districts, or in burrows, which they excavate. They are valued for their fur, particularly the *Caninchilla* of the Andes (*C. lanigera*), of which the fur constitutes an important article of commerce. Their numbers are said to be sensibly decreasing in consequence of the demand for the fur. The ancient Peruvians were accustomed to employ the wool of the C. for the manufacture of fine fabrics. Molina suggests, that it might easily and profitably be kept in a domesticated state.

**CHINCHO'N,** a town of Spain, in the province of Madrid, 25 miles south-south-east of the city of that name. It is pleasantly situated on a hill near the Tagus, and is well built, with wide, regular, and clean streets. Agriculture forms the chief occupation of the inhabitants, but leather, linen, and earthenware are manufactured to a small extent. Pop. 5400.

**CHINDWA'R'A,** a town of Nagpore, in Hindustan, in lat. 22° 3' N., and long. 78° 58' E. It occupies a plateau amid the Deogurh Mountains, standing 2100 feet above the level of the sea. Its climate is consequently one of the most agreeable and salubrious in India, attracting many visitors in search of health or recreation.

**CHINE, LA,** a village of the Dominion of Canada, on the south side of the island of Montreal, and about 9 miles to the west of the city of that name. Both the city and the village stand on the left bank of the St Lawrence, or rather, of a branch of the Ottawa; for here, and at least 10 or 12 miles further down, these united rivers keep their waters unmixed. As the intermediate portion of the

Longitude East 115 of Greenwich

120

125

stream forms the Rapids of St Louis, the consequent interruption of the navigation naturally rendered La C. a turning-point between the maritime and the inland communications. Gradually, however, its importance in this respect has been diminished, if not extinguished, by works between it and Montreal—a canal, a railway, and even improvements in the rapids themselves. The population is now 1550.

**CHINESE EMPIRE**, a vast territory in Eastern Asia, comprehending five great divisions—viz., 1. Manchuria (*q. v.*) ; 2. Mongolia (*q. v.*) ; 3. Turkestan (*q. v.*) ; 4. Tibet (*q. v.*) ; 5. China Proper, or the Eighteen Provinces (*Shih-p'ü-sang*), including the two large islands of Formosa and Hainan—the former being reckoned in the province of Fuh-keen, and the latter as a department of Kwang-tung.

*China Proper* occupies the eastern slope of the table-lands of Central Asia. In form it approaches to a square, and covers a surface eighteen times as large as Great Britain. It is inhabited by more than 360 millions of the human race, living under the same government, ruled by the same laws, speaking the same language, studying the same literature, possessing a greater homogeneity, a history extending over a longer period, and a more enduring national existence than any other people, whether of ancient or modern times; indeed, when we consider its high antiquity, its peculiar civilisation, its elaborate administrative machinery, its wondrous language, its philosophy and classic literature, its manufacturing industry and natural productions, giving rise to such a gigantic commerce with our own land, China is perhaps the most remarkable country in the world, and is worth a closer and more serious study than has yet been generally accorded to it. China Proper is included between 18° and 40° N. lat. (which takes in the island of Hainan), and 98°—124° E. long. Its coast-line exceeds 2500 miles, and the land-frontier 4400 miles. A line running direct north and south would give a length of 1474 miles; and another at right angles to this, 1355 miles; but one drawn diagonally from its north-eastern extremity through Yun-nan would measure 1669 miles. The area of China Proper is usually given as 1,297,999 square miles; but Dr Williams considers that the entire dimensions of the 18 provinces, as the Chinese define them, cannot be much under 2,000,000 square miles. All these measurements, however, must be taken as mere approximations.

*Physical Features*.—China has a general slope from the mountains of Tibet to the shores of the Pacific. The two principal mountain-chains divide it into three longitudinal basins, drained by those great rivers for which China is famous. Within its provinces are found alluvial plains, fertile river-valleys, large populous towns, as well as thinly inhabited hilly and mountainous regions. To describe its surface more particularly, it may be viewed under its natural divisions of mountainous country, hilly country, and the Great Plain. The first comprehends more than half the region between the meridian 113° and Tibet. East of this meridian, and to the south of the Yang-tze-kiang river, is the hilly country, which includes the provinces of Fuh-keen, Keang-se, Kwang-tung, and a portion of Hu-nan and Hu-pih; while to the north-east stretches the Great Plain. This latter extends from the Great Wall to 30° N. lat.: a line drawn from King-chow in Hu-pih to Hwae-king on the Yellow River, may be considered its western limit; and the sea forms its boundary on the east. This vast and generally fertile tract has an area of 210,000 square miles, and supports a population of 177 millions.

From the mountains of Tibet two grand ranges stretch across China, having a general direction

from south-west to north-east. The more northerly of these—the Thsin-ling or Blue Mountains—are included between the parallels of 31° and 34°. The southern or Nan-ling chain is a spur of the Himalayas. Commencing in Yun-nan, it bounds Kwang-se, Kwang-tung, and Fuh-keen on the north, and passing through the province of Che-keang—where some of its peaks reach the height of 12,000 feet—enters the sea at Ning-po; thus forming a continuous barrier—penetrated only by a few steep passes, of which the Mei-kwan, or Mei Pass, is the best known—that separates the coast-land of South-eastern China from the rest of the country. This great chain throws off numerous spurs to the south and east, which, dipping into the sea, rise above it as a belt of rugged islands along the southern half of the Chinese sea-board. Of this belt, the Chusan Archipelago is the most northerly portion.

The magnificent river-system of China is represented by those noble twin streams, the Hoang-ho or Yellow River, and the Yang-tze-kiang, which, springing from the same water-shed, the eastern mountains of Tibet, are widely separated in their mid course, but enter the sea within 2° of each other. The former has its source in 35° N. lat., and about 96° E. long.; and after a very tortuous course, empties itself into the ocean in lat. 34°.\* It is a 'mighty, impracticable, turbid, furious stream' for the most part, and little adapted for Chinese navigation. But the river most beloved by the Chinese is the Yang-tze-kiang, or 'son of the ocean'—more correctly translated, 'the son that spreads'—which name is only applied to it by the natives below the commencement of the delta; for above that it is called simply Ta-kiang or Great River. The basin drained by it is estimated at 750,000 square miles. Of the other rivers that water the country, the Peiho in the north, and the Choo-keang in the south, are the most noteworthy.

The principal lakes of China are five in number—viz., the Tung-ting-hu, in 113° E. long., with a circumference of about 220 miles; the Poyang-hu, in 116° E. long., 90 miles in length by 20 in breadth; the Hung-tsin-hu, in Keang-su; the Tsau-hu, between Ngankin-fu and Nankin; and the Tai-hu, in 120° E. long. On these lakes, artificially constructed floating-islands, with houses, fields, and inhabitants, animals, and birds, are sometimes seen.

The *Grand Canal* has very greatly facilitated the internal navigation of the country. Until lately the great annual grain-fleet, with its 430,000 tons of rice for the use of the capital, passed from the south to the neighbourhood of Pekin by this great water-way; thus avoiding the storms and pirates of the coast, but the alteration already mentioned in the course of the Hoang-ho, has rendered it comparatively useless. It connects Tien-tsin in Chih-le with Hang-chow in Che-keang; though the canal proper commences in Shan-tung, and its total length is about 650 miles.

Another world-famous structure is the *Great Wall*—called Wan-li-chang (myriad-mile-wall) by the Chinese—which was built by the first emperor of the Tsin dynasty about 220 B.C., as a protection against the Tartar tribes. It traversed the northern boundary of China, extending from 34° E. to 15° W. of Pekin, and is carried over the highest hills, through the deepest valleys, across rivers and every other natural obstacle. The length of this great barrier is, according to M'Culloch, 1250 miles. Including a

\* The Hoang-ho has recently altered its course, and now enters the sea in a somewhat higher latitude. Such changes, causing losses, and entailing expense, are not unusual; and hence this river has been called 'China's sorrow.'

20 feet; thickness at the base, 20 feet; and at the top, 15 feet. Towers or bastions occur at intervals of about 100 yards. These are 40 feet square at the base, and 30 feet at the summit, which is 37 feet, and in some instances 48 or 50 feet, from the ground. Earth enclosed in brickwork forms the mass of the wall; but for more than half its length it is little else than a heap of gravel and rubbish.

*Geology.*—The high lands, where are the sources of the great rivers of China, consist of granitic and metamorphic rocks. These are continued round the south and south-east of the country, until they leave a huge basin, through which flow the Yang-tze-kiang and Hoang-ho, occupied by fossiliferous strata. The wild and rugged scenery of the larger portion of China is owing to the predominance of those crystalline and sub-crystalline rocks. The fossiliferous strata exhibit representatives of the various formations. The Palaeozoic rocks are but sparingly developed in a narrow stripe which runs from near Pekin, in a south-westerly curve, to nearly the centre of the empire. Cretaceous rocks occur in the valley of the Yang-tze-kiang. Tertiary beds fill up the eastern portion of the immense basin; while extensive districts to the west of this region, extending to the crystalline rocks in the extreme west, are covered with modern detritus.

Though no active volcanoes are known to exist except one in Formosa, yet indications of volcanic action are not wanting. Salt and hot-water springs are found in Yun-nan; sulphur springs near Foo-chow; and wells of petroleum in Shen-se and Formosa. The most famous amongst the minerals of China is jade or the yu-stone, obtained chiefly in Yun-nan. Coal, limestone, and porcelain clays are abundant. Precious stones are said to be met with in some districts. In Yun-nan, gold is washed from the sands of the rivers, and in the same province silver-mines are worked; here, too, is obtained the celebrated pe-tung or white copper. All the commoner metals are likewise found in China. Near the city of Ning-po are extensive stone-quarries.

*Vegetable Productions.*—Our knowledge of the flora of China has been much advanced by the researches of Mr Fortune; and his works contain valuable notices of the geography, culture, and varieties of the tea-plant, and of the botany of the country generally. The tea-plant (*Thea viridis* and *Thea bohea*) is the most important vegetable production of China. See art. TEA. The tallow-tree (*Stillingia seifera*), the *Dryandra cordata* or varnish-tree, the camphor-tree (*Laurus Camphora*), the Chinese pine (*Pinus Sinensis*), the Chinese banyan (*Ficus nitida*), the funeral cypress—introduced into this country by Mr Fortune—and the mulberry, are amongst the most important trees of China. The cocoa-nut and other palms flourish on the southern coast. Of the bamboo, which grows as far north as lat. 38°, there are 63 principal varieties; and it is said that the bamboos of China are more valuable than her mines, and, next to rice and silk, yield the greatest revenue. The various uses to which they are applied is truly astonishing; and, amongst others, the bamboo is famous as an instrument of punishment. The fruits of both the tropical and temperate zones—apples, grapes, pomegranates, mangoes, pine-apples, three species of orange, the lichi, &c.—are found in the country; and camellias, azaleas, and gardenias are natives of the ‘Flowery Land.’ The *nymphaea*, or water-lily, is greatly prized by the Chinese, both for ornament and in an economical point of view. *Agriculture* is held in higher estimation in China than, perhaps, any other country in the world. On the first day of each year, a

the emperor, accompanied by his great officers or state, repairs to the Sacred Field, and having offered sacrifices on an altar of earth, he traces a furrow with the plough, and his example is followed by princes and ministers. A like solemnity is celebrated by the governor of every province, who represents the emperor. The agricultural system of the Chinese is rude, but effective; and every inch of arable land is carefully cultivated. Spade-husbandry and irrigation are carried on to a great extent. The Chinese have a strong perception of the value of night-soil as a manure; for, whilst in this country thousands of pounds' worth are annually thrown into the Thames, in China it is everywhere saved, bears a high price, and is collected in a manner exceedingly offensive to European notions. In the northern provinces, the cereals are principally maize, barley, and wheat; but in the south, rice is raised in vast quantities, and forms the staple food of the people. Tobacco and the poppy are also raised in considerable quantities.

*Animals.*—Very little is really known of the zoology of China. Some of the more ferocious of the carnivorous animals still linger in the jungles of Yun-nan, and are occasionally found along the whole of the Nanling range of mountains as far as Ning-po, where there is a mart for their skins. Wild cats are common in the forests of the south, and bears are still found in the hills of Shan-se. Of the ruminantia, there are the musk-deer (*Moschus moschiferus*), the moose-deer, and a few other species. The gold and silver pheasant, the argus pheasant, and other gallinaceous birds, hold a prominent place in the ornithology of China. Fly-catchers, thrushes, grackles, and goat-suckers have their representatives in China, and there are several species of crows, jays, and magpies. Water-fowl inhabit the lakes, rivers, and marshes. The larger reptiles are unknown; but tortoises and turtles abound on the coast, and lizards are plentiful in the south. The ichthyology of China is considered to be one of the richest in the world. Sharks, rays, sturgeons, and other cartilaginous fishes, are common on the coast; and the carp formerly was very plentiful in the lakes and rivers. The goldfish has been introduced into Europe from China. Of insects, the arachnidæ are large and numerous; indeed, a tree-spider captures and kills small birds. Locusts often commit extensive ravages. Silk-worms are highly valued, and reared in large numbers.

In a country of such vast extent—extending from 18° to 40° N. lat.—the climate must vary greatly. Indeed, as regards both climate and productions, China may be divided into three zones—the northern, the central, and the southern. The northern zone extends to the 35th parallel, and includes the fine provinces of Shang-tung, Chih-le, Shan-se, Shen-se, and Kan-su. It produces the grains, fruits, and animals of Northern Europe. Here the children are red-cheeked, and the extremes of heat and cold are great. In Chih-le, the winters are very severe; and at that season ice a foot thick renders the rivers unnavigable. The natural productions of this and the contiguous northern provinces are wheat, barley, oats, apples, the hazel-nut, and the potato; they are also rich in wood and minerals. The central zone, the richest portion of China, contains eight provinces—Sze-chuen, Kwei-chow, Hu-nan, Hu-pih, Keang-su—and is bounded by the 27th or 28th parallel; tea and silk are its characteristic products; the middle portion is the granary of China, and the eastern part is celebrated for its manufactures of silk and cotton. The southern

## CHINESE EMPIRE.

zone embraces five provinces—Yun-nan, Kwang-tung, Kwang-se, Fuh-keen, and Che-keang. The exchange of its tropical productions for those of the northern zone is an important branch of the internal commerce of the country. Kwang-tung lies partly within the tropics; and the whole province is tropical, both in climate and productions. Its fruits are oranges, lichees, mangoes, and bananas; rice is its staple grain, and it produces the ground-nut, the sweet potato, and the yam. The following table (no later census has been made) exhibits the situation, area, and population of the eighteen provinces into which China is divided for administrative purposes :

PROVINCES—	Population.		Pop. per Square Mile.	Square Miles.
	Census of 1812.	Pop. per Square Mile.		
<i>Northern Provinces—</i>				
Chih-ic,	27,990,871	58,949	475

But, according to the *Almanach de Gotha* for 1873, the population of C., properly so called, was estimated at 420,000,000; and of the rest of the empire, including Mantchuria, Mongolia, Tibet, and Corea, 26,000,000—in all, 446,000,000.

*Inhabitants.*—Ethnologically, the Chinese belong to that variety of the human species distinguished by a Mongolian conformation of the head and face, and a monosyllabic language. See CHINESE LANGUAGE, WRITING, AND LITERATURE. A tawny or parchment-coloured skin, black hair, lank and coarse, a thin beard, oblique eyes, and high cheek-bones, are the principal characteristics of the race. The average height of the Chinaman is about equal to that of the European, though his muscular power is not so great; the women are disproportionately small, and have a broad upper face, low nose, and linear eyes. Of the general character of the Chinese, it is not easy to form a fair and impartial judgment; and those who have resided long in the country, and know them well, have arrived at very different conclusions. M. Huc asserts that they are 'destitute of religious feelings and beliefs,' 'sceptical and indifferent to everything that concerns the moral side of man,' 'their whole lives but materialism put in action'; but 'all this,' says Mr. Meadows, 'is baseless calumny of the higher life of a great portion of the human race.' He admits, indeed, that these charges are true of the mass of the Chinese, just as they are true of the English, French, and Americans; but as amongst these there is a large amount of generosity and right feeling, and also a minority higher in nature, actuated by higher motives, aiming at higher aims,' so also, he maintains, is there amongst the Chinese a similar right feeling, and a like minority who live a higher life than the people generally. See HIOUEN-THEANG. As regards valour, their annals record 'deeds akin to the courage of antiquity'; they have no fear of death, commit suicide as the solution of a difficulty, and endure the most cruel tortures with a passive fortitude; but neither their arms nor discipline enable them

to stand before European forces. The Chinese are, as a race, unwarlike, fond of peace and domestic order, capable of a high degree of organisation and local self-government, sober, industrious, practical, unimaginative, literary, and deeply imbued with the mercantile spirit. It is to be observed that the inhabitants of China Proper are essentially one people; the differences, except in dialect, being hardly more marked than between the Northumbrian peasant and the Cornish miner. The south-eastern Chinese—the people of Kwang-tung, Fuh-keen, and the south of Che-keang—are the most restless and enterprising in all the eighteen provinces, and may be regarded as the Anglo-Saxons of Asia. In the mountainous districts of the four south-eastern provinces of China, but principally in Kwang-se, are certain tribes who maintain a rude independence, wear a peculiar dress, and are descended from the aboriginal inhabitants of China. Of these, the Meaon-tze are the best known.

The manners and customs of the Chinese can only here be glanced at. The worship of ancestors is a remarkable and prominent feature in their social life, and is dictated by that principle of filial piety which forms the basis of Chinese society. The rich have in their houses a chamber—a kind of domestic sanctuary—dedicated to their forefathers. Tablets, representing the deceased persons, and inscribed with their names, are here carefully preserved; and at stated seasons, prostrations and ceremonies are performed before them according to the Book of Rites. All Chinese worship from time to time at the tombs of their parents. In everything that relates to death and sepulture, the customs of the Chinese are no less singular. They meet their last enemy with apparent unconcern; but whilst their future state troubles them little, they regard the quality of their coffins as of vital importance, and frequently provide them during their lifetime; indeed, a coffin is reckoned a most acceptable present, and is frequently given by children to their parents. 'To be happy on earth,' say the Chinese, 'one must be born in Su-chow, live in Canton, and die in Lianchau'—Su-chow being celebrated for the beauty of its women, Canton for its luxury, and Lianchau for furnishing the best wood for coffins. Yet death is never alluded to in direct terms, but indicated

Chinese Match-makers.

rather by periphrases, such as—the person 'exists no more,' 'he has saluted the age,' 'ascended to the sky,' &c. Banquets are offered to the dead, and pathetic speeches addressed to them. In China, marriage is universal, and within the reach of all;

monial match-makers. Minute ceremonial observances regulate every step, and frequently the bride and bridegroom see each other on the wedding-day for the first time. Women hold a very inferior position, and are little better than slaves. Polygamy is not recognised by law, but secondary wives are common, especially when the first proves barren. Infanticide, though regarded as a crime, is undoubtedly practised to some extent, as is proved by edicts issued against it; and parents possess almost unlimited authority over their children. The intercourse of the Chinese with each other, especially of the upper classes, is regulated by a tedious and elaborate etiquette; indeed, they are the slaves of custom, and everything is done by precedent. Many curious instances of Chinese politeness might be cited. The well-bred host presses many things on a visitor, which the latter must never dream of accepting. 'A Chinaman,' says Mr Oliphant, 'has wonderful command of feature; he generally looks most pleased when he has least reason to be so, and maintains an expression of imperturbable politeness and amiability, when he is secretly regretting devoutly that he cannot bastinado you to death.' The *Le-king*, or Book of Rites, regulates Chinese manners, and is one cause of their unchangeableness; for here they are stereotyped, and handed down from age to age. The ceremonial usages of China have been estimated at 3000; and one of the tribunals at Pekin—the Board of Rites—is charged with their interpretation. Chinese cookery, in the use of made dishes, more nearly resembles the French than the English. Birds' nests soup, sharks' fins, deer-sinews, and ducks' tongues, are amongst its delicacies. The wine, or weak spirit (*tew*), more correctly speaking, used by the Chinese is made from rice; and from this, again, they distil a stronger spirit, the 'samahoo' of Canton. The former is drunk warm in minute cups at their meals; tea never appears during a repast, though it may be taken before or after. The Chinese have numerous festivals; and perhaps the most remarkable of these is that celebrated at the commencement of the new year, when unbounded festivity prevails. Preparatory to this, debts are settled, and the devout repair to the temples to gain the favour of the gods. The first day of the year may, in one sense, be reckoned the birthday of the whole people, for their ages are dated from it. Visiting is, at the same time, carried on to a great extent, whilst parents and teachers receive the prostrations and salutations of their children or pupils. The festival of the dragon-boats is held on the fifth day of the fifth month; and at the first full moon of the year, the feast of lanterns. In the manufacture of these the Chinese excel; and on the night of the festival, lanterns illuminate each door, wonderful in their variety of form and material.

In the matter of *dress*, the Chinaman exhibits his usual practical sense, and varies the material according to the season, from cotton-wadded or fur-lined coats to the lightest silk, gauze, or grass-cloth. On the approach of cold weather, he lights no fire in his dwelling, but puts on additional clothing until the desired temperature is attained. A tunic or kind of loose jacket fitting close round the neck, and a wide short trouser, are his principal garments. Shoes are made of silk or cotton, with thick felt soles. White is the colour of mourning. The Tartar tonsure and braided queue became general with the Manchu conquest of the country, since which 180 millions of men have the hair removed from their heads at short intervals; and

818

very sparing in his ablations, and appears to be afflicted with a strange hydrophobia; for cold water, either as a beverage or for washing his person, he holds in abomination. Long nails are fashionable. The costume of the women differ but little from that of the men, and their shoes are the most remarkable part of their toilet. A lady's shoe measures about 3½ inches from the heel to the toe. The feet of the Tartar women are left as nature made them; but amongst the Chinese, all young girls of the better classes are crippled by a tyrant custom. In early infancy the feet are tightly bound, the four small toes being tucked under the sole, of which, after a time, they become a part, and the heel is brought forward. The process is at length complete; stumps have been substituted for the ordinary pedal extremities, and the Chinese lady totters on her goat's feet.

The principal manufactures of the Chinese are silk, cotton, linen, and pottery, for which latter they are especially celebrated. The finest porcelain is made in the province of Keang-se. The Chinese invented printing in the beginning of the 10th c., and in 932 A.D. a printed imperial edition of the sacred books was published. The skill of the Chinese in handicraft is astonishing. Their rich silks and satins, light gauzes, beautiful embroidery, elaborate engraving on wood and stone, delicate filigree-work in gold and silver, carvings on ivory, fine lacquered ware, antique vessels in bronze, and their brilliant colouring on the famous pith paper, command our admiration.

Of the grand modern discoveries in the *physical sciences* the Chinese are profoundly ignorant, and the study of nature is altogether neglected. The Chinaman objects to be wiser than his forefathers, but spends a lifetime in studying his classical literature and the sages of antiquity; and here is doubtless one great cause of the homogeneity of the race, and the stereotyped nature of the Chinese mind.

Of *animal physiology and medicine* the Chinese have very crude notions, as is shewn by their scheme of the human body, in which the heart is placed in the centre, with the other organs ranged round it, and their unphilosophical theory of the pulse, which plainly demonstrates that they are ignorant of the true circulation of the blood, and the vascular system in man; hence their practice of medicine must be empirical. Chinese physicians believe that man is composed of five elements; that so long as each maintains its due proportion, health is preserved; but should one gain the ascendency, illness follows, and the equilibrium must be restored by proper remedies. Acupuncture is practised. The Chinese have had the opportunity of practically testing the superiority of Western medical science, by the establishment of English and American hospitals, the introduction of vaccination, and by the publication of popular treatises on *Physiology and Practical Surgery*, &c., by Dr Hobson, late of Canton. It is worthy of remark, that these books were eagerly sought after, and excited a deep interest amongst their literati; indeed, the *Physiology* has been twice republished by persons holding high official situations at Canton, and in a preface to the Chinese edition, the publisher observes: 'Our science, indeed, cannot compete with that of the philanthropic author.'

*Government.*—In the centralised autocratic government of China, the emperor is absolute in the empire, the governor in the province, the magistrate in the district. The emperor claims no hereditary divine right, and is not always the eldest son of the

preceding monarch; the ablest son is nominated, but his right to the throne as the *Tien-tze*, or *Tien-tze*, 'son of heaven,' the *Fung-tien*, 'divinely appointed,' can only be established by good government, in accordance with the principles laid down in the national sacred books. If, on the contrary, he violates these principles, the people firmly believe that heaven signifies, by unmistakable signs, that their ruler is not its chosen representative. 'The rivers rise from their beds, the ground sullenly refuses its fruits, the plains tremble, the hills reel, and the typhoon rages over seas and coasts, all alike uttering a "Numbered, numbered, weighed and parted," that requires no interpretation, but is read in anxiety by the people, in dismay and terror by the prince,' who seeks by repentance, and a return to the true principles of the government, to avert his doom. The emperor is absolute as legislator and administrator; but he must legislate in accordance with the general principles acknowledged in the country. He also constitutes, in his own person, the highest criminal court. The Chinese possess a carefully digested code of laws, which is added to and modified from time to time by imperial edicts. Their penal code commenced 2000 years ago, and copies of it are sold at so cheap a rate as to be within reach of people of the humblest means. Death, which the Chinaman prefers to long confinement, is the penalty for a large number of offences, and in ordinary years about 10,000 criminals are executed. Several modes of torture are legal. The emperor is assisted in governing by two councils—1. *The Inner or Privy Council*, composed of six high officials, three of whom are Chinese and three Mantchus. The four senior ministers exercise functions corresponding to those of an English prime-minister. 2. *The General or Strategical Council*, which closely resembles our cabinet; being composed of the most influential officers in the capital, who exercise high legislative and executive duties. Under these are six *yamen* or colleges of government, each charged with a distinct department of government. Over all is the Court of General Inspection, or the *Censorate*, as it is called by foreigners. The mandarins composing this number from 40 to 50; they are 'the eyes and ears of the emperor'; for it is their province to see that all officers of the government, provincial or metropolitan, are faithful in the discharge of their respective duties; and they alone have the right to make representations or complaints to the emperor.

The *administrative machinery* of the Chinese is very perfect in its organisation, and demands an attentive consideration for the right understanding of the people and government. In each of the 18 provinces is an imperial delegate or governor, who, besides being at the head of the civil jurisdiction, is commander-in-chief, and possesses the power of life and death for certain capital offences. He is privileged to correspond with the cabinet-council and the emperor. Under the governor are the Superintendent of Provincial Finances, the Provincial Criminal Judge, and the Provincial Educational Examiner; each communicates with his especial board in Pekin. The governor is also assisted by many other judicial and administrative officials. The governmental organisation of each province is complete in itself, but in a few instances two provinces—Kwang-tung and Kwang-se, for instance—form a viceroyalty, over which a governor-general, in addition to the governors, exercises authority. Every province is again subdivided into districts, departments, and circuits. The average number of districts in a province is eighty, and each of these is about the size of an English county. A civil functionary, called sometimes the

district-magistrate, presides over this division, and is assisted by several subordinate officers. A group of districts—six is the average number for the whole 18 provinces—forms a department, and is ruled by a prefect, who resides in the *fu* or departmental city. Three departments, on an average, constitute a circuit, of which an intendant (*Taotai*) has the charge.

The several grades of mandarins, or Chinese government officials (Chinese name, *kuan-fu*), are distinguished chiefly by a different-coloured ball or button on the top of the cap. There are twelve orders of nobility confined to the imperial house and clan, and also five ancient orders of nobility open to the civil and military servants of the state. The normal government of China is less a despotism than a morally supported autocracy, and it is in principle paternal. What the father is to his family, that the governor, the prefect, and the magistrate are intended to be, each in his own sphere, to the people; whilst the emperor stands in the same relation to the myriad inhabitants of his vast dominions. In ordinary times, the Chinaman enjoys much practical freedom, and can travel through the country without passport, or follow any calling he likes.

The Chinese executive system is based on those noteworthy competitive examinations, which are intended to sift out from the millions of educated Chinese the best and ablest for the public service. The first examination takes place every three years in the capital of each department, when the lowest degree—that of bachelor—is conferred on a certain number of candidates from each district. Triennial examinations are held in the provincial capital, presided over by two examiners from Pekin, at which sometimes as many as 10,000 bachelors present themselves, and compete for the degree of licentiate. Some 1200 obtain it, and these may attend the triennial metropolitan examination at Pekin, when about 200 may hope for the coveted degree of doctor, which insures immediate preferment.

Mr Meadows, the most philosophical, perhaps, of our writers on China, and from whose works the foregoing sketch of the administrative system of the country has been chiefly derived, has entered very fully into what may be termed the *philosophy of Chinese government*, which he sums up in the following doctrines, and believes them to be deducible from the classic literature of the country, and the true causes of the wonderful duration of the Chinese empire. 1. That the nation must be governed by moral agency, in preference to physical force. 2. That the services of the wisest and ablest men in the nation are indispensable to its good government. 3. That the people have the right to depose a sovereign who, either from active wickedness or vicious indolence, gives cause to oppressive and tyrannical rule. And to these he adds an institution—the system of public-service competitive examinations. But, on the other hand, these examinations, by directing the attention of students solely to the ancient literature of the country, to the exclusion of the physical sciences and inductive philosophy, however efficient in producing that wonderful homogeneity for which the inhabitants of the Central Kingdom are famous, stunt and stereotype the national mind, which, like the dwarfed tree the Chinaman delights to raise in a flower-pot, or the feet of a Chinese girl, can never fully expand.

*Education*, as the high road to official employment, to rank, wealth, and influence, is eagerly sought by all classes. Literary proficiency commands everywhere respect and consideration, and primary instruction penetrates to the remotest

followed by a great number of the *literati*. Government provides state-examiners, but does not otherwise assist in the education of the people. The Chinese have a remarkable reverence for the written

pirate chief to some high civil employment. Even yet he is sometimes appointed pilot. The Chinese are now building frigates on their own account—another evidence of the stride taken under the regency of Prince Kung.

*Revenue.*—The estimates of the public revenue of China vary greatly, and while they are stated by some to exceed 100 millions sterling, are held by others not to come up to half that amount. Official returns of the Chinese government—intended for a special use—were published in 1844, according to which the revenue amounted to £63,934,713, derived mainly from three sources—customs duties, licenses, and a tax upon land.

*Religion.*—The Chinese, remarkable in so many ways, exhibit, in the matter of religion, their usual eccentricity. Three forms of belief—the Confucian, the Buddhist, and the Taoist—may be considered the national religions, as they are believed in, more or less, by the great mass of the people. Of these, the Confucian and the Taoist are indigenous, but Buddhism was introduced from India. A struggle for ascendancy was long maintained between these religions, but has now entirely ceased; indeed, it is no unusual thing for all three to be professed by the same person, and as they supplement each other, this is not altogether inconsistent. Confucianism is the basis of the social life and political system of the Chinese. It has been professed by all their greatest men, and is still the sole belief of the educated classes. It is, however, less a religion than a philosophy, and does not pretend to treat of spiritual things; hence room was left for other creeds to supply its deficiencies in this respect. The questions to which Confucius replied were: ‘How shall I do my duty to my neighbour? How can I best discharge the duty of a virtuous citizen?’ Funereal temples are erected to Confucius, and though his image is not used as an idol, his tablet is worshipped, and sacrifices of oxen and sheep are offered before it at the vernal and autumnal equinoxes. For an account of Confucius’s philosophy, see CONFUCIUS.

Buddhism in China, though extending over the whole country, and influencing more or less the mass of the people, is fast losing its hold on them, and has very little of the power and authority it once possessed. Its edifices are going to decay, and no new ones rise upon

their ruins. Its priests are illiterate, and together with their religion, are held in contempt by the philosophic Chinaman. Aged people and women are now its chief devotees. The accompanying sketch of the begging-monk (taken, as well as the other cuts, from Cobbold’s *Pictures of the Chinese by Themselves*) is characteristic. He wears a loose yellow robe and large stockings; at his back is a wallet in which to receive the contributions of the faithful; and he gives notice of his approach by striking his

muh-yu, as represented in the illustration.

The northern form of Buddhism, which differs considerably from that of Ceylon and the Indo-Chinese Peninsula, prevails in China. Its sacred books, in common with those of Nepaul and

Collectors of Paper Scraps.

character. Waste printed paper is collected from house to house and burned, to preserve it from profanation.

*Army.*—According to the *Pekin Gazette*, China has a prodigious army, but in reality the greater part figures only on paper. Each province is provided with a military force varying from 8000 to about 68,000 men. According to Mr Meadows, the average for each province is about 34,500 men, and 640 officers. The governor of a province is also commander-in-chief, and is assisted by a general-in-chief, as well as lieutenants and majors general. The Chinese and Tartar troops form two important divisions of the army. The Tartar garrisons are indeed the real strength of the Manchu emperor. That at Pekin is 150,000 strong; and 18 others, averaging each about 3000 men, are dotted about the provinces, forming, with their wives and children, military colonies. These troops, which are armed with good two-edged swords, and serviceable matchlocks, or the national bow, have alone been able to stand against the victorious Tae-ping rebels, and turn them from the capital. According to the most recent statistics (see *Die wirtschaftlichen Zustände im Süden und Osten Asiens*, Stuttg. 1871), the army is composed of 678 companies of Mantchus of 100 men each, of 211 companies of Mongols, of 106,000 Chinese cavalry, and of 500,000 Chinese infantry, besides a large body of irregular militia—in all 820,000 men. The Tartar infantry-soldier receives four taels a month, and the trooper four and a half. The Marquis de Moges (see Baron Gros’s Embassy) thinks that ‘two regiments of chasseurs and two regiments of Zouaves would suffice to conquer China.’ ‘There is not,’ he says, ‘a corps in the empire that could stand fast under a bayonet charge.’ This, however, is no longer the case. The native troops in all the large cities of the empire are drilled after the European fashion, and armed with the Snider and other breech-loading rifles; and in the opinion of intelligent English residents, the next Chinese war will be a very different affair from anything that has preceded it.

*Navy.*—The imperial navy is divided into river and sea-going vessels. The former amount, it is said, to 1900 ships; the latter, to 918—with an aggregate number of 188,000 sailors. This force, however, is insufficient to extirpate or even keep in check the

Chinese Buddhist Monk.

Tibet are written in Sanscrit, or are translations from that language. Amongst other additions to the creed are the Western Paradise and the Goddess of Mercy.

Taoism has not more hold than Buddhism on the literate Chinese. Its priests are generally ignorant men, few of them teaching or understanding the real principles of their faith. They practise a mystic alchemy, prepare spells and incantations, and, like modern spiritualists, hold intercourse with the dead. When all other remedies have failed with a sick person, the Taoist priests are sometimes

politer classes, when strangers meet, the question is asked : 'To what sublime religion do you belong ?' and each one pronounces a eulogium, not on his own religion, but on that professed by the others, and concludes with the oft-repeated formula : 'Religions are many ; reason is one ; we are all brothers.' The government is equally tolerant of religious diversity, except where a political design is suspected.

Temples belonging to the three religions are very numerous. Those dedicated to Confucius are funereal in character. The Buddhist temples are crowded with images, and Buddha is represented expounding his doctrine to attentive listeners. The many-storied tower takes the place of the bell-shaped dagoba or relic-shrine of other Buddhist countries.

*History and British Intercourse.*—The early annals of China, like those of most other countries, belong rather to mythology than to history. Beginning with Pan-ku, the first of all beings, the country was ruled over first by gods, and then god-descended personages, who revealed to men the essential arts of life. Of those mythical rulers the most famous is Fo-hi. The historical period may be said to commence with the Hia period or dynasty, begun by Yu the Great about 2200 B.C., although a great infusion of the fabulous still continues. Some date the real history of China from the Tchow or Chow dynasty, which began with Wu-wang about 1100 B.C. It was during the reign of Ling-wang (571–544), one of this dynasty, that Confucius was born. China would seem during this period to have been divided into a number of independent states. The kings of Tsain gradually gained the ascendancy, and at last one of them reduced the other states to subjection (247 B.C.), and assumed the title of Hoang, or emperor. It is from the Tsain dynasty that the country has taken its name, Tsina or China. This first emperor finished the Great Wall (see above), as a protection against the Tartars, who had all along, under the name of Hiong-nu (Huns), been a source of danger and annoyance to the richer and more pacific Chinese. We cannot enumerate the various dynasties that followed, nor the frequent divisions and reunions of the empire, varied by incursions and partial subjugations by the troublesome Tartars. At last, the Mongols or Western Tartars, being called in to aid the Chinese (1209), became finally (see KUBLAI KHAN) masters of the whole country (1279), and reigned over it till 1368, when they were expelled by the Chinese, and the Ming native dynasty succeeded, which lasted 276 years, and fell at length through its own misgovernment. A general of the last Ming emperor, who was employed in keeping the Mantchus (q.v.) in check, made peace with them, and obtained their assistance against the native usurper who had deposed his sovereign. The Mantchus established themselves in Pekin (1644), and finally, after a seven-years' struggle, acquired the sovereignty of the whole empire. Many of the conquering race now filled the highest offices of state, and owed their position to birth alone. More than one powerful emperor of the race has ably conducted the government of the country ; but Hien Fung, who ruled from 1850 to 1861, was reported to have passed his time in a state of drunken imbecility. The late emperor, Tung-chi, succeeded to the throne when only a child five years old, but the government was ably carried on under the co-regency of the empress-dowager, Tze-an, the empress-mother, Tze-sse, and the enlightened Prince Kung, brother of Hien Fung. Kwang-sei, cousin of Tung-chi, ascended the throne in 1875. As he was then only about four years old, the empresses continued to act as regents.

Chinese Taoist Priest exorcising.

sent for to exorcise the evil spirit that is supposed to afflict the patient; and they chant prayers from their mystic ritual, amid the din of gongs, drums, flutes, &c. These mystics worship certain stars, which are supposed to influence human life, and also genii, devils, and inferior spirits. They live in temples with their families, and are known by their slate-coloured robes. For a fuller account of Taoism and its doctrines and founder, see LAO-TSE.

Besides these three religions, which alone affect the bulk of the people, there is a *ritual state worship*, which regards the emperor and court alone—a kind of philosophic pantheism, an adoration of certain natural objects ; but it is a mere ceremonial, and associated with no theological doctrines. Three classes of objects are distinguished, to which the great, medium, and lesser sacrifices are offered. The first class includes the heaven and the earth. Equal to these, and likewise restricted to the worship of the emperor, is the great Temple of Imperial Ancestors. The medium sacrifices are offered to the sun and moon, the gods of the land and grain, genii, and sages. In the third class are reckoned certain natural phenomena, as well as deceased statesmen and scholars. The emperor appears to acknowledge a Supreme Being as king of kings, the rewarder of virtue and the punisher of vice ; but still, Chinese philosophy, as fixed by Chu-tze, is atheistical, and deduces 'the development of the universe from one unintelligent and will-less principle.' Hence all educated Chinese are atheists, at least theoretically, as will be found by arguing with them ; but when they speak of human affairs generally, and their own particular lot in life, they exhibit a belief in *Tean* as a supreme, intelligent, rewarding, and punishing power.

Between the followers of the three national religions, there is not only a total absence of persecution and bitter feeling, but a very great indifference as to which of them a man may belong. It arises probably from religious apathy ; yet still it is preferable to the fanatical zeal and cut-throat earnestness of the Moslem. Amongst the

remarkable is the rise, progress, and overthrow of the Tae-ping rebels. Their famous leader, Hung-sew-tseuen, was a man of humble origin, and an unsuccessful candidate for government employment. Some Christian tracts, it is said, led him to renounce idolatry, and he founded a society of God-worshippers, which, in the autumn of 1850, was brought into collision with the imperial authorities, and immediately assumed a political character. Hung persuaded himself and his followers that he had received a divine commission to uproot idolatry, extirpate the Tartar intruders in the country, and establish the new native dynasty of Tae-ping, or Universal Peace. He assumed the title of Heavenly or Divine Prince (Tae-ping-wang, sometimes called Tien-wang), and bestowed the titles of Eastern Prince, Western Prince, Southern Prince, Northern Prince, and Assistant Prince on five of his chosen leaders. The fanatical principle of divine revelations and other extravagances followed. They spoke of Tien-ma, the wife of the Heavenly Father; they held that Tien-wang was the son of God as really as Jesus, and worshipped him accordingly. Polygamy was a dark feature of their system, the Tien-wang himself having married 30 wives. The course of this religio-political rebellion, the victorious march of the Tae-ping army from Kwang-se to Nankin in 1850—1853, and its subsequent career, cannot here be traced. We can only afford room to state, that after a series of wasteful and revolting barbarities, it was finally suppressed in 1865 by the imperial troops, led by British and American officers, of whom the most conspicuous and able was Colonel Gordon. See *TAE-PING*.

In early times, the Chinese do not appear to have been opposed to intercourse with foreigners; but the conduct of the Spaniards and Portuguese between 1520 and 1570 excited their hostility. The Manchu government restricted British trade and intercourse to Canton, where it was carried on through the medium of the *hong* merchants on one side, and the East India Company on the other. Differences arose, however, from time to time between these two commercial bodies, occasioned chiefly by the exactions of the mandarins on foreign trade. With a view to a better understanding, the British government despatched to Pekin an embassy under Lord Macartney in 1792, and another under Lord Amherst in 1816. On the 22d April 1834, the monopoly of the East India Company ceased, and British imperial officers were appointed to carry out the new judicial and fiscal arrangements. Constant dissensions between these and the mandarins continued till the end of the year 1839, when the latter, under pretence of stopping the opium-trade, committed acts of open hostility. A war broke out the following year, at the commencement of which Chinese officials talked of invading England overland, by way of Russia. The imperial government was, however, sufficiently humbled by the middle of the year 1842, and on the 29th August, a treaty of peace was signed before Nankin, by which the ports of Amoy, Fu-chow, Ning-po, and Shang-hae were, in addition to Canton, thrown open to foreign trade. The other most important articles of the treaty provided that the island of Hong-kong should be ceded in perpetuity to her Britannic Majesty, her heirs and successors, and that the emperor of China should pay 21,000,000 dollars towards the expenses of the war.

With five free ports, British trade with China soon assumed gigantic proportions; and though the Chinese evaded the treaty whenever practicable, no important event occurred to interrupt commercial intercourse till 8th October 1856, when the

222

*Arrow*, a vessel registered at Hong-kong, and entitled, it was considered, to British protection. Under pressure from the British forces at hand, the imperial commissioner, Yeh, delivered up the men, but refused all apology. Yeh continuing obstinate, Canton was stormed (December 28, 1857) by the allied French and English forces, and the Chinese imperial commissioner captured (January 5, 1858). The government of the city was still carried on by Chinese officials, but under the authority of the plenipotentiaries and commander-in-chief. The former now proceeded to the north of China, to put themselves in more direct communication with the imperial government, which still continued obstinate. The forts at the mouth of the Peiho were taken (May 20, 1858), and at length an important treaty was signed at Tien-tsin, June 26, 1858, which stipulates that the queen of Great Britain may (Art. ii.) appoint diplomatic agents to the court of Pekin, who (Art. iii.) shall be allowed to reside at the capital, where also her Majesty may acquire a building site. The Christian religion (Art. viii.) shall be protected by the Chinese authorities. British subjects (Art. ix.) shall be allowed to travel for pleasure or business to all parts of the interior, under passports issued by their consul. British merchant-ships shall trade (Art. x.) upon the Great River (Yang-tze); but as its lower valley is disturbed by outlaws, no port except Chin-keang shall be opened for the present. Chin-keang to be opened in a year from the date of the signing of the treaty.

By this treaty, the vexed question of transit-dues is settled, it being agreed that the British merchant may purchase at the rate of 2½ per cent. *ad valorem*, in the case of imports at the port of entry; and in the case of exports, he may purchase a certificate enabling him to pass his goods, duty-free, to the port of shipment. By a separate clause, the Chinese government agreed to pay two million taels (about £650,000), as indemnity for losses sustained by British subjects at Canton, and a like sum towards the expenses of the war.

The repulse on the Peiho (June 1859), by a Tartar force concealed in the Taku forts, of the expedition forming the escort of the British and French ambassadors, who were on their way to Pekin, to ratify with the emperor of China the treaty of Tien-tsin, entailed another costly demonstration in the Chinese waters. The Taku forts were captured by the allied English and French forces, August 21, 1860, and Pekin itself in Dec. 1860. The treaty of Tien-tsin was ratified, two additional articles being inserted, one of which legalised coolie emigration. Since 1861, a gradual but beneficial change has come over the spirit of the Chinese government. Prince Kung proved a vigorous and successful regent. The army has been reorganized, and is now subjected to European drill (see par. *Army*); a respect for the observance of treaties has sprung up; a national flag has been adopted, and a desire shewn on the part of the Chinese to make themselves acquainted with international law. In 1866 arrangements were begun for telegraphic communication between Pekin and the rest of the world, but have not yet been carried out; and emigration to all other countries was allowed. Chinese are now found on almost every shore of the Pacific—in Australia and the United States, where their industry, skill, and sobriety as labourers, have secured them abundant employment.

*Commerce*.—The rivers and numberless canals of China are covered with vessels of all sizes, employed in the internal commerce of the country, which consists chiefly in the exchange of the various

products of the several provinces. The Chinese are devoted to traffic, and the Middle Kingdom is throughout its length and breadth a perpetual fair. British trade with China has from small beginnings assumed great importance. Tea and silk are the great staple imports from China into Great Britain. The total value of the exports from China to the United Kingdom, and of the imports of British and Irish produce and manufactures into China was as follows in each of the ten years from 1862 to 1871 :

Years.	Exports from China to Great Britain.	Imports of British Home Produce into China.
1862.	\$12,137,026	£2,024,118
1863.	14,186,810	2,416,708
1864.	15,673,930	3,093,611
1865.	10,677,995	3,603,595
1866.	10,846,388	5,090,074
1867.	9,349,402	4,996,469
1868.	11,217,450	6,315,175
1869.	9,631,358	6,842,340
1870.	9,481,737	6,139,533
1871.	11,830,383	6,928,238

There is no coinage in China except the copper *tchen*, or 'cash,' which is in value about the tenth of a halfpenny; and all but the most trifling payments are made by a certain weight of silver, or in Mexican or Spanish dollars. Chinese accounts are kept in taels, mace, candareens, and cash. A tael is worth 5s. 6*d.*, British currency.

The following works (which have been used as authorities in the preparation of this article) may be consulted for further information on China. Meadow's *Chinese and their Rebellions* (Lond. 1856); Davis's (Sir J. F.) *China: a General Description of that Empire* (Lond. 1857); Davis's *China during the War and since the Peace* (Lond. 1852); Williams's *Middle Kingdom* (New York and Lond. 1848); Oliphant's *Narrative of the Earl of Elgin's Mission to China and Japan, in the years 1857, 1858, and 1859* (Edin. 1859); Marquis de Moga's *Recollections of Baron Gros's Embassy to China and Japan in 1857 and 1858* (Lond. 1860); Huc's *Chinese Empire* (Lond. 1858); Cooke's *China in 1857 and 1858*; Fortune's *Three Years' Wanderings in China* (Lond. 1847); Fortune's *Visit to the Tea Districts of China* (Lond. 1852); Edkin's *Religious Condition of the Chinese* (Lond. 1858); Cobbold's *Pictures of the Chinese by Themselves* (Lond. 1859); *Twelve Years in China, by a British Resident* (Edin. 1860); *Memoires sur la Chine* (1869); Rev. A. Williamson's *Journeys in North China, &c.* (Lond. 1870), a work of great value and authority; Doolittle's *Social Life of the Chinese* (Lond. 1871); Dr A. Bastian's *Die Völker des östlichen Asiens* (6 vols. Jena, 1866—1871).

CHINESE INK. See INDIAN INK.

CHINESE LANGUAGE, WRITING, AND LITERATURE. The Chinese language belongs to those Asiatic languages commonly called monosyllabic, because each word is uttered by a single movement of the organs of speech, and expresses in itself a complete idea or thing. All Chinese words end either in a vowel, a diphthong (in which, however, each vowel sound is distinctly pronounced, making the word often to appear of more than one syllable), or a nasal. Of such simple words or roots there are about 450. But the emphasis or accent of many of these words may be varied by the speaker in four or five different ways, so as to produce a corresponding variety in their meaning, by which means the number of simple words or roots amounts to about 1200. There is no distinction of parts of speech in the Chinese language, and no recognition of the principle of inflection, Chinese words being incapable of any modification of form. The relations of words are ascertained by their position in a

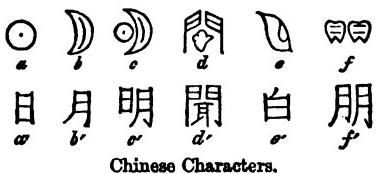

sentence. Hence Chinese grammar is solely syntax. Thus it, according to its position in a sentence, at one time serves the purpose of an adjective, meaning 'great'; at another, a substantive, meaning 'greatness'; and again of a verb, meaning 'to enlarge' and 'to be great,' or of the adverb 'very.' There are certain words, however, which have at length lapsed into so vague and general a signification, that in conversation and literature they are now used in some cases as particles to determine the relations of other words; but in the older literature this is very rare, and is against the genius of the language. From what has been said, it will readily be inferred that the gender, number, and case of words are not determined by the form of the words themselves. They are, in fact, denoted by the addition of other words. Thus, *people* in Chinese is *multitud man*, *son* is *man child*, *daughter* is *woman child*. *The best of men* is in Chinese a *hundred man good*. The purest Chinese is spoken at Nankin, but the same idiom, called 'the language of the mandarins,' is spoken by the educated in all parts of the empire. For a knowledge of Chinese grammar, see Schott's *Chinesische Sprachlehre* (Berlin, 1857); Summers's *Handbook of the Chinese Language* (1863); Julien, *Syntaxe Nouvelle de la Langue Chinoise* (Paris, 1870); Morrison's *Dictionary of the Chinese Language* (Shanghai, 1866).

In Chinese the written character, generally speaking, does not indicate the sound of the word, but gives a kind of hieroglyphic or pictorial representation of the idea or thing to be expressed. Hence there are required as many of these characters or symbols as there are ideas to be represented. Since many words similar in sound are different in signification, whilst in writing each idea has its peculiar symbol, the number of words represented by writing—without reckoning those peculiar to certain dialects—is perhaps ten times greater than those distinguished by the ear. The number, in fact, is reckoned at 50,000, but these are far from being all in general use. In writing and printing, the characters are arranged in perpendicular columns, which follow one another from right to left.

In its origin, Chinese writing is hieroglyphic or picture-writing, with the addition of a limited number of symbolical and conventional signs; the larger number of Chinese characters are formed by the combination of such hieroglyphs and signs. But as one such character by itself seldom determines the sound, an additional word is conjoined for this purpose; so that the great mass of Chinese written words consist of an ideographic and a phonetic element. Native grammarians divide their characters into six classes. The first class comprises simple pictorial representations of sensible objects, such as sun, moon, mountain, &c., and contains 608 characters. The second class includes such characters as are formed by the combination of two or more simple hieroglyphs, which together convey, in a more or less intelligible manner, some other idea: for example, the hieroglyph for sun, combined with that for moon, conveys the idea of light; mouth and bird, that of song, &c.; of these there are 740. The third class embraces those characters which indicate certain relations of position, as above, below, the numerals, &c.; of these there are 107. The fourth class consists of characters which, by being inverted, acquire an opposite signification, as right, left, standing, lying, &c., and contains 372. The characters of the fifth class are termed derived characters; the meaning of the simple or compound characters used to express physical objects, is transferred to mental objects, or to other physical objects with which they are associated, e.g., the hiero-

598. The characters of the sixth class include those which are composed, as above mentioned, of sign and sound. Almost all names of plants, fishes, birds, and many other objects which it would be difficult to represent hieroglyphically, are denoted by the compound characters of the sixth class, which amount to 21,810 in number. As this class, however, consists merely of repetitions of the other five classes, the immense number of Chinese characters may be reduced to 2425; and whoever learns these may be said to know them all.

The hieroglyphical characters in their oldest form were easily recognisable figures: thus, the hieroglyph for sun was as in the fig. at *a*; for moon, as at *b*; for light, a combination of sun and moon, as at *c*; for to listen, folding-doors and an ear, as at *d*; for white, a very squint eye, in which hardly anything but the white is seen, as at *e*; for friends,

the two valves of a bivalve shell, as at *f*. In the course of time, through hasty and careless tracing, the objects denoted by the hieroglyphs have almost ceased to be recognisable. The modern hieroglyphs corresponding to the above are as represented at *a'*, *b'*, *c'*, &c. See Abel Rémy's 'Mémoire sur l'Écriture Chinoise,' in the *Mémoires de l'Académie des Inscriptions*, vol. viii.; and for a view of the Chinese characters, both ancient and modern, Hager's *Monument de Yü* (Par. 1802).

The Chinese literature, in a geographical, ethnographical, and historical point of view, is unquestionably the most comprehensive and important of the whole of Asia. The printed catalogue of the Emperor Kien-long's library is composed of 122 volumes; and a selection of the Chinese classics, with commentaries and scholia, which was begun by the order of the same emperor, is said to comprise 180,000 volumes, of which, in the year 1818, 78,731 volumes had already appeared. In the five canonical or classical books, called *King*, are contained the oldest monuments of Chinese poetry, history, philosophy, and jurisprudence, some portions of which belong, perhaps, to the most ancient writings of the human race. Confucius (q. v.), in the 6th c. B.C., collected them from various sources, and in this collection they have been pretty faithfully handed down to us. Next to these in value are the *Sce-shu*, or the four books. These, as they were written by Confucius and his disciples, must be regarded as the most trustworthy source of insight into the intellectual and political life of the Chinese. A complete and elaborate edition of the five *King* and the four *Shoo* has been undertaken by our great English Sinologue, Dr Legge, under the title of 'The Chinese Classics, with a translation, critical and exegetical notes, prolegomena, and copious indexes. In seven volumes'; of which only three have as yet appeared (Hong-kong, 1861—1865). A popular edition of vol. i., under the title of 'The Chinese Classics translated into English. Vol. I., The Life and Teachings of Confucius,' was published at London in 1867. Almost contemporary with Confucius lived Lao-tse (q. v.), who was born 604 B.C. He

cius, but which has now degenerated into the lowest and most vulgar kind of demonology; see *Le Livre de la Voie de la Vertu*, Chinese and French, by Julien (Par. 1842). In mythology, the Chinese have *The Book of the Mountains and Seas*, *The History of the Gods and Spirits*, and some others. In jurisprudence may be mentioned the universal collection of laws, and the criminal code of the present dynasty; see *Ta-Tsing-tu-li*, being *the Fundamental Laws and Supplementary Statutes of the Penal Code of China*, by Staunton (Lond. 1810). The Chinese literature is also very rich in works on medicine, natural history, astronomy, agriculture, military science, music, and all branches of mechanics and industry; see *Résumé des principaux Traité Chinois, sur la Culture des Mûriers et l'Education des Vers-a-soie*, by Julien (Par. 1837). In philology, the most valuable works are the dictionaries, in which the Chinese characters have been collected and elucidated by examples from the whole treasury of Chinese literature; but the greatest of all works of this kind is the dictionary of the Emperor Kang-hi, which is now regarded as the highest authority for the pronunciation and meaning of the characters. Of the encyclopedias of the Chinese, the most conspicuous is that by Ma-tuan-lin (1300 A.D.), called *Wen-hien-thong-kao*—i.e., an accurate investigation of the ancient documents, with rich supplements. This is an inexhaustible mine of the best materials for a thorough knowledge of the Chinese empire and the neighbouring races, from the remotest periods to the present time. But the most valuable portions of the Chinese literature are, undoubtedly, their historical and geographical works, which are indispensable to a knowledge of Upper Asia. See-ma-thian (100 B.C.) compiled, from every recognised authority, a work called *See-ki*, or historical memorials, which embraces the history of China from the year 2637 B.C. up to the commencement of the dynasty of Han in the 2d c. B.C. This work has been continued by the different dynasties, and forms a complete collection of the annals of the empire up to the termination of the Ming dynasty in 1643 A.D. It is known under the title of *Nian-eul-se*, or the 22 histories. The entire collection of the official annals from 2698 B.C. to 1645 A.D., comprising a period of 4343 years, and consisting of 3706 books, is to be found in the library at Munich.

Amid all their scientific labours, the Chinese have not neglected the art of poetry, in which they possess voluminous collections that have yet to be made known to Europe. In lyrical poetry, the most distinguished names are Li-thai-pe and Tu-su, both of whom flourished at the beginning of the 8th c. A.D.; see Davis 'On the Poetry of the Chinese,' in the *Transactions of the Royal Asiatic Society*, vol. ii. The romantic poetry of the Chinese, although void of poetic beauty, is valuable for the insight it gives into their domestic life. Their dramatic poetry has laws peculiar to itself, and resembles partly the romantic drama of the Germans, and partly the *comedia delle arte* of the Italians. They have also a kind of novel in dialogues, which forms a subordinate species of drama. Besides the speaking persons or actors, there is what they call a singing person, who introduces into the piece songs which he sings to popular melodies, and appears to correspond in a rude way to the Greek chorus. The best collection of works in this species of literature is the *Yuen-dechir-pe-tehong*, i.e., the hundred dramas from the Mongol dynasty (1260—1341), from which all the Chinese dramas known to Europeans have been taken. A Chinese novel

affording a graphic view of the tastes and literary views of that people, has recently been placed within the reach of European readers by the eminent Chinese scholar Stanislas Julien, under the title of *Les Deux Jeunes Filles Lettrées* (Par. 1860). English readers may also obtain instructive pictures of Chinese life from *Iu-kias-ki*, or the Two Fair Cousins, translated from the French version of Remusat in 1827; and *The Flower Scroll*, translated, with numerous learned notes, by Sir John Bowring, in 1868. But valuable sketches will be found in Schott's *Chinesische Sprachlehre* (1857), Davis's *Chinese Miscellanies* (1865), and Wylie's *Notes on Chinese Literature* (Shanghai, 1867).

**CHINESE SEA**, or **CHINA SEA**, that portion of the Pacific Ocean which has China and Siam on the west, the island of Formosa on the north, the Philippines on the east, and Borneo on the south, and which forms the great Gulfs of Tonquin and Siam.

**CHINESE WHITE.** The white oxide of zinc has recently been introduced into the arts, under this name, as a pigment in place of the preparations of white-lead. It changes very little either by atmospheric action, or by mixture with other pigments; but it has not the body of white-lead.

**CHINGLEPUTT.**—1. A fort, with a town adjacent, in lat. 12° 41' N., and long. 80° 2' E., 36 miles to the south-west of Madras. It is accessible to an enemy only from the south, having a tank or artificial lake on the east and part of the north, and rice-fields, irrigated from the same, on the remainder of the north and on the west. In the dry season, the tank is nearly exhausted, the weeds and slime in its bed causing malaria. Notwithstanding this, however, the place is considered to be more than ordinarily healthy.—2. A district taking its name from the fort above mentioned, which is politically its capital. It stretches in N. lat. from 12° 14' to 14°, and in E. long. from 79° 35' to 80° 25', and contains 3100 square miles. Pop. (1872) 940,744. With about 120 miles of coast, it has not a single harbour or anything like shelter from the surf. Nor is its internal navigation of any value. The only considerable river, the Palar, is in most parts destitute of water during the dry season. Excepting in October, November, and December, comparatively little rain falls. From that circumstance, and perhaps also from an inferiority of soil, cultivation is said to be so much circumscribed, as to embrace only about 96,000 acres, or 1-20th part of the entire area.

**CHINI**, a village of the Punjab, about a mile from the right bank of the Sutlej, the most easterly of the five rivers which give name to the country. It is in lat. 31° 31' N., and long. 78° 19' E., and is 8770 feet above the sea. Notwithstanding this elevation, it is a delightful place of sojourn, and was a favourite residence of Lord Dalhousie. It occupies a slight depression on the southern slope of a lofty mountain, which fertilises the soil with a net-work of never-failing rills. The neighbourhood is remarkable for the size and flavour of its grapes, while the vines, trained over horizontal lattices, afford, while in foliage, a tolerably continuous shelter.

**CHIN-KEANG-FOO** ('River-Guard City'), a Chinese city and port on the Yang-tze-kiang, at the junction of the Grand Canal with that river, and about 150 miles from its mouth, was opened to European commerce by the treaty of Tien-tsin (1858), and a British settlement was begun in 1864; but trade is very slowly developing, and there is reason to doubt if C. will ever become a place of importance. The anchorage is bad, the port is not

a natural outlet for any staple of exportation produced in the neighbouring country, and it possesses no advantage as regards the introduction of foreign goods. Formerly, however, as the southern key of the Grand Canal, it was both an important stronghold and a centre of traffic. The injury which the Grand Canal has sustained has for the present practically extinguished the inland trade, and the four years (1853—1857) during which it was in the barbarous hands of the Tae-pings are said to have reduced the population from half a million to 500.

**CHINNOR**, a musical instrument of the ancient Hebrews, with 32 strings.

**CHINON**, a town of France, in the department of Indre-et-Loire, beautifully situated on the Vienne, 25 miles south-west of Tours. It has the remains of a huge old castle, formerly the occasional residence of the Plantagenet kings of England, and also of some of the French sovereigns, and celebrated as the place where Joan of Arc commenced her historical career. C. has manufactures of druggets, sashes, earthenware, &c. Pop. (1872) 4625.

**CHI'NQUAPIN.** See CHESNUT and OAK.

**CHINSURĀ**, a town on the right bank of the Hooghly, about 20 miles above Calcutta, in lat. 22° 53' N., long. 88° 23' E. Pop., along with Hooghly (1871), 34,761. It contains the Hooghly College, and is considered one of the healthiest places in Bengal. It was originally a Dutch settlement, but was ceded in 1824 to the British, along with some other places on the mainland, in exchange for the English possessions in the island of Sumatra.

**CHINTZ**, a highly glazed printed calico, with a pattern in many colours on a white or light-coloured ground. It is chiefly used for bed-hangings, for covering furniture, and other purposes where gay colours are desired, and where there is much exposure to dust, which does not adhere to its highly calandered surface.

**CHI'O.** See SCRO.

**CHIOCOCCA**, a genus of tropical and subtropical plants, of the natural order *Cinchonaceæ*, of which two species in particular, *C. anguifuga* and *C. densifolia*, the former a trailing herb, the latter a bushy shrub, enjoy a high reputation in their native country, Brazil, as cures for snake-bites. An infusion of the bark of the root is certainly one of the most violent emetic and drastic medicines known, its action being accompanied with spasmodic agitations of the whole frame and other symptoms, such as to preclude its use except in the most extreme cases. Yet it had at one time a high reputation in Europe, and was administered in small doses as a diuretic and purgative.

**CHIOGGIA**, or **CHIOZZA**, an important commercial town and seaport of Northern Italy in the Venetian district, stands on an island of the same name in the Adriatic, and is connected with the mainland by a stone bridge of 43 arches. The population, amounting to (1871) 26,336, are chiefly engaged in the coasting-trade, in lace-making, and in shipbuilding.

**CHIONIS** and **CHIONIDÆ**. See SHEATH-BILL.

**CHIP HATS.** See BRAZILIAN GRASS.

**CHIPPEHAM**, a parliamentary and municipal borough in Wiltshire, in a valley on the left bank of the upper part of the Bristol Avon, on the Great Western Railway, 22 miles east of Bristol. It consists chiefly of a well-built street above half a mile long. A bridge of 21 arches crosses the Avon here. C. is famed for its markets of cheese and corn, its cheese-market being one of the largest in Britain. There are silk and woollen manufactures;

and some mineral springs in the vicinity. Population of parliamentary borough (1871) 6875; of municipal 1387. It returns one member to parliament. C. was the seat of the Saxon kings of Wessex. About 880, the Danes took it from Alfred, and kept it two years.

CHI'PEWAYS. See INDIAN.

CHIQUICHIQUI PALM (*Leopoldinia Pia-saba*), the PIASSABA of the north of Brazil, and one of the palms which yield the Piassaba (q. v.) fibre, now so much used for making brushes. The Piassaba fibre exported from Pará is all obtained from it. It grows in swampy or occasionally flooded lands on the banks of the Rio Negro and other rivers of Venezuela and the north of Brazil; and has a crown of very large, regularly pinnate leaves, with smooth slender stalks. The leaves, like those of many other palms, are much used for thatching. The commercial fibre is obtained from a remarkable covering of the stem; formed of marginal processes of the leaf-stalks, elongated into ribbon-like strips, and interlaced, finally splitting into fine fibres, hanging down five or six feet, and entirely concealing the stem, so as to give the tree a very extraordinary appearance. It twists readily into cordage, and the fibre has been long used for cables of canoes on the Amazon and other rivers. Before the independence of Brazil, the Portuguese government had a factory on the Rio Negro, for the manufacture of cables of this fibre. The export of the unmanufactured fibre from Pará to England began about the middle of the present century.

CHIQUIMULLA, Isthmus or, in Central America, to the south-east of the peninsula of Yucatan, in long. 89° W. Its breadth from the Caribbean Sea to the Pacific is about 150 miles—the greatest elevation not exceeding 2000 feet.

CHIRATA, CHIRETTA, or CHIREFTA (*Agathotes Chirayta*, also known as *Ophelia Chirata*), an officinal plant belonging to the natural order Gentianaceæ, and possessing properties similar to those of the common Gentian, the Centaury, and other plants of that order. It is a native of the mountains of the north of India. The whole plant is intensely bitter, and has been long used in its native country as a tonic and stomachic. It is also in high estimation with European practitioners in India as a febrifuge, and is often used by them as a substitute for cinchona. The medicinal virtues reside both in the herb and root. The whole plant is pulled up at the time when the flowers begin to fade, and is dried for use. It is now imported to some extent into Britain.

CHIRQUI', a name of various application in Costa Rica, the most southerly state of Central America.—1. A river flowing towards the north—the lat. and long. of its mouth being about 9° N., and 82° 30' E.—2. A spacious lagoon with three entrances, and with a depth of water for the largest ships, which receives the river above mentioned. It measures 90 miles along the coast, and 40 or 50 in width.—3. An archipelago between the lagoon above mentioned and the Caribbean Sea.

CHIRON, or CHEIRON, the most famous of the Centaurs (q. v.). In the ancient works of art, C. of course appears as half-man, half-animal; but his features, instead of expressing mere savage and sensual strength, as those of the Centaurs generally do, are marked by a mild wisdom, in harmony with the character and deep knowledge attributed to him by the Greek mythologists.

CHI'RRA POO'NJEE, a town in the north-east of India, in lat. 25° 14' N., long. 91° 45' E. It stands on the Cossya Hills, at the height of 4200

feet above the sea—and has a temperature during the hot months 20° F. lower than that of the plains of Bengal. Notwithstanding this, however, the place has proved unsuccessful as a sanatorium. The vicinity abounds in mines of coal and iron, which may be profitably worked.

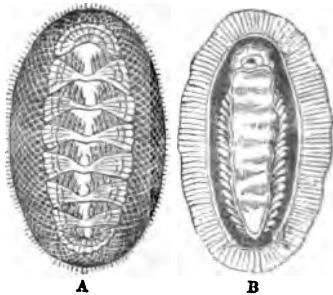

CHI'RU (*Antilope Hodgeoni*), a species of antelope, inhabiting the pine-forests and elevated open plains of Tibet, in regions bordering on the limits of perpetual snow. It is much larger than the chamois, being about five feet in length, and the height at the shoulder about three feet. The C. lives in great herds, and seems to exceed almost all the other gregarious ruminants in watchfulness against the approach of danger. Sentinels are constantly posted, to prevent surprise.

CHITSWICK, a village in the centre of Middlesex, 7½ miles south-west of St Paul's, London, on the left bank of the Thames. Pop. (1871) 8508. Around C. are many fine villas, extensive market-gardens, to supply London, and the gardens of the London Horticultural Society.

CHITIN forms the skeleton of all insects and crustaceans. In insects, it constitutes not merely the external skeleton, the scales, &c., but also forms their trachea, and thus penetrates into the most remote portions of their organs; indeed, one of the layers of their intestinal canal consists of chitin. Hence, we can make good preparations of these parts by treating insects with a solution of potash, which dissolves all but the C.: in this way, we can microscopically examine the most delicate parts, as, for instance, the valves of the tracheal openings.

In a state of purity, it is a white amorphous body, which usually retains the form of the tissue from which it is prepared. It has been analysed by C. Schmidt, Lehmann, and other chemists. Schmidt considers that its composition is represented by the formula  $C_{14}H_{14}NO_{11}$ . The best method of obtaining C. is by boiling the elytra of the cockchafer with water, alcohol, ether, acetic acid, and alkalies. The substance left after these respective boilings is pure chitin. It seems to be identical with the substance termed by Lassaigne *Entomaderm*.

CHI'TON, a Linnean genus of mollusca. Linnaeus, regarding merely the shell, placed them in the class of Multivalves, a class entirely artificial. They are now regarded as constituting a family (*Chitonidae*) of gasteropodous mollusks, of the order Cyclobranchiata of Cuvier, and as occupying a

Chiton Squamosus:  
A, animal and shell seen from above; B, animal seen from below.

place in systematic arrangement close to limpeta. The shell is composed of eight narrow, transverse, calcareous pieces, overlapping each other in a row along the back, and strongly attached to the mantle, which is remarkably fleshy and fibrous.

whole system of C.; and her substitution Philosophy or Reason of Boethius is v teristic of a state of society in which and passions, rather than the int motive principles. The 'Lo complete generalisation, al individual object, and proffers to her vot favour the specia is supposed to The 'Mare rous id whe i
